PANTOLOGIA.

A

NEW CYCLOPÆDIA,

COMPREHENDING

A COMPLETE SERIES OF

Essays, Treatises, and Systems,

ALPHABETICALLY ARRANGED;

WITH A GENERAL DICTIONARY OF

ARTS, SCIENCES, AND WORDS:

THE WHOLE

PRESENTING A DISTINCT SURVEY OF

Human Genius, Learning, and Industry.

ILLUSTRATED WITH

ELEGANT ENGRAVINGS;

THOSE ON NATURAL HISTORY BEING FROM ORIGINAL DRAWINGS BY EDWARDS AND
OTHERS, AND BEAUTIFULLY COLOURED AFTER NATURE.

BY JOHN MASON GOOD, ESQ. F.R.S.

MEMBER OF THE AMERICAN PHILOSOPHICAL SOCIETY, AND OF THE LINNEAN SOCIETY OF
PHILADELPHIA;

OLINTHUS GREGORY, LL.D.

OF THE ROYAL MILITARY ACADEMY, WOOLWICH, AND HONORARY MEMBER OF THE LITERARY AND
PHILOSOPHICAL SOCIETY, NEWCASTLE-UPON-TYNE; AND

MR. NEWTON BOSWORTH,

OF CAMBRIDGE;

ASSISTED BY OTHER GENTLEMEN OF EMINENCE, IN DIFFERENT
DEPARTMENTS OF LITERATURE.

VOL. IX.

P — PYZ.

LONDON:

PRINTED FOR G. KEARSLEY; J. WALKER; J. STOCKDALE; R. LEA; E. JEFFERY;
CROSBY AND CO.; SHERWOOD, NEELY, AND JONES; SUTTABY, EVANCE, AND CO.;
J. BLACKLOCK; W. LOWE; J. BOOTH; J. RODWELL; BELL AND BRADFUTE, EDINBURGH;
BRASH AND REID, GLASGOW; AND M. KEENE, DUBLIN.

1813.

PANTOLOGIA.

P

P A labial consonant, formed by a slight compression of the anterior part of the lips, and retaining an uniform sound, and the fifteenth letter in the English alphabet.

When the P is followed with an H in the same word, it has the sound of an F; thus, *philosophy* is pronounced *filosophy*: and this is generally the case in words derived from the Greek.

P and B are so like each other, that Quintilian declares, that in the word *obtineuit*, his reason required him to put a *b*, but that his ears could hear nothing but a *p*, *optineuit*: hence in ancient inscriptions, and old glossaries, it appears, that these two letters have often been confounded.

Several nations still pronounce one for the other, the Welch and Germans particularly, who say, *ponum vinum*, for *bonum vinum*.

Plutarch observes, it was usual for those of Delphi to say *βουλει* for *παιλει*, *βουρρυ* for *πυρρυ*; and among the Latins, as often as an *s* followed, the *b* was changed into as *p*, as *scribo*, *scripsi*.

P is sometimes mute before *i*, as, *accompit*; but in modern orthography it is usually omitted.

P, in the Italian music, frequently represents *piano*; which is what in our music we call soft, i. e. the force of voice or instrument is to be diminished, so as to make a kind of echo.

PP signifies *piu piano*, i. e. more soft, or a second echo weaker, or more remote than the former: and PPP signifies *pianissimo*, softest of all, or a third echo, the voice being as it were lost in the air.

P. M. among astronomers, is frequently used for *post meridiem*, or afternoon; and sometimes for *post mane*, after the morning, i. e. after midnight.

VOL. IX.

P A B

P was also used among the ancients as a numeral letter, signifying the same with the G, viz. a hundred; according to the verse of Ugutio.

P similem cum G numerum monstratur habere, Though Baronius thinks it rather stood for seven.

When a dash was added a-top of *P*, it stood for four hundred thousand.

St. Jerome observes on Daniel, that the Hebrews had no P; but that the *ph* served them instead thereof; adding, that there is but one word in the whole Bible read with a P, viz. *apadno*.

The Greek π signified 80. The Latins used P as an abbreviation. Thus P stood for Publius, pondo. &c. In S. P. Q. R. or Senatus populusque Romanus, for populus; R. P. denoted *res publica*; P. C. *patres conscripti*; PR. S. *prætoris sententia*, &c. On the French coins, P denotes those that were struck at Dijon.

P, in medicinal prescription, is used for *pugil*, or the eighth part of a handful.

P. Æ. signifies *partes æquales*, equal parts of any ingredients: otherwise denoted by *a* or *ana*.

P. P. signifies *pulvis patrum*, i. e. Jesuit's powder, or the cortex Peruvianus in powder; which is so called, because first brought into Europe by those fathers; and *p. p. t. preparatus*, prepared.

PA'BULAR. *a.* (*pabulum*, Lat.) Affording aliment or provender.

PABULATION. *s.* (*pabulum*, Lat.) The act of feeding, or procuring provender.

PA'BULOUS. *a.* (*pabulum*, Latin.) Alimantal; affording aliment (*Brown*).

PABULUM. (from *pasco*, to feed.) Food, aliment. Whence the animal heat and animal spirits are called *pabulum vitæ*, the food of life.

PACA, in zoology. See *Mus*.

PACCHIONIAN GLANDS, in anatomy. See *GLANDULÆ PACCHIONÆ*.

PACE. *s.* (*pas*, French.) 1. Step; single change of the foot in walking (*Milton*). 2. Gait; manner of walk (*Sidney*). 3. Degree of celerity (*Shakspeare*). 4. Step; gradation of business (*Temple*). 5. A measure of five feet (*Holder*).

PACE is also used to signify particular motions or progressive actions of a horse. A horse has a great variety of paces, as a walk, trot, amble, canter, gallop, rating-gallop, and at speed; some of these some horses have in great perfection, which are nevertheless exceedingly deficient in others; as for instance, a horse shall be a most excellent trotter, who happens to be a shuffling, execrable walker; he shall be a gay, airy, light figure in a canter, and wonderfully different in speed. Good gallopers, again, are very frequently bad trotters.

TO PACE. *v. n.* (from the noun.) 1. To move on slowly (*Spenser*). 2. To move (*Shakspeare*). 3. (Used of horses.) To move by raising the legs on the same side together.

TO PACE. *v. a.* 1. To measure by steps (*Shakspeare*). 2. To direct to go (*Shakspeare*).

PA'CED. (from *pace*.) Having a particular gait (*Dryden*).

PA'CER. *s.* (from *pace*.) He that paces.

PACHAMAC, or **PACHACAMA**, a town of Peru, in the audience of Lima, situate in a valley of its name, formerly beautified with a magnificent temple, built by the incas, in which the Spaniards, when they conquered Peru, found immense riches. It is 15 miles S.S.E. of Lima.

PACHETE, a fort of Hindustan, in Bengal. It gives name to a circar, and stands near the Dummuda, 10 miles N.E. of Rogo-natpour.

PACHUCA, a town of Mexico Proper, famous for the rich silver mines in its vicinity. It is 55 miles N. by E. of Mexico. Lon, 100. 14 W. Lat, 20. 42 N.

PACHYNUS, a promontory of Sicily, projecting about two miles into the sea, in the form of a peninsula, at the south-east corner of the island, with a small harbour of the same name.

PACIFIC. *a.* (*pacifique*, French; *pacificus*, Latin.) Peace-making; mild; gentle; appeasing (*Hammond*).

PACIFIC OCEAN, otherwise called the **SOUTH SEA**, lying between Asia and America, and upwards of 10,000 miles in breadth. When Magellan entered this ocean through the dangerous strait that bears his name, he sailed three months and twenty days in a uniform direction to the N.W. without discovering land. In the distress he suffered in this voyage, before he discovered the Ladrone islands, he had the consolation of enjoying

such uninterrupted fair weather, with favourable winds, that he gave this ocean the name of Pacific. The Spaniards having passed the isthmus of Darien, from N. to S. at the first discovery of this ocean, named it the South Sea; but, with respect to America, it is more properly the western ocean. On one side of the equator, it is called the North Pacific Ocean; and on the other, the South Pacific Ocean.

PACIFICATION. *s.* (*pacification*, Fr.) 1. The act of making peace (*South*). 2. The act of appeasing or pacifying (*Hooker*).

PACIFICATOR. *s.* (*pacificateur*, French; from *pacify*.) Peacemaker (*Bacon*).

PACIFICATORY. *a.* (from *pacificator*.) Tending to make peace.

PA'CIFIER. *s.* (from *pacify*.) One who pacifies.

TO PA'CIFY. *v. a.* (*pacifier*, French; *pacifico*, Latin.) To appease; to still resentment; to quiet an angry person; to compose any desire (*Bacon*).

PACK. *s.* (*pack*, Dutch.) 1. A large bundle of any thing tied up for carriage (*Cleave*). 2. A burden; a load (*L'Estrange*). 3. A due number of cards (*Addison*). 4. A number of hounds hunting together. 5. A number of people confederated in any bad design or practice (*Clarendon*). 6. Any great number, as to quantity or pressure: as, a *pack* or world of troubles.

TO PACK. *v. a.* (*packen*, Dutch.) 1. To bind up for carriage (*Otway*). 2. To send in a hurry (*Shakspeare*). 3. To sort the cards so as that the game shall be iniquitously secured (*Shakspeare*). 4. To unite picked persons in some bad design (*Hudibras*).

TO PACK. *v. n.* 1. To tie up goods (*Cleaveland*). 2. To go off in a hurry; to remove in haste (*Tusser*). 3. To concert bad measures; to confederate in ill (*Carew*).

PA'CKCLOTH. *s.* (*pack* and *cloth*.) A cloth in which goods are tied up.

PA'CKER. *s.* (from *pack*.) One who binds up bales for carriage (*Pope*).

PA'CKET. *s.* (*pacquet*, French.) 1. A small pack; a mail of letters (*Denham*). 2. A small bundle.

PACKET, or **PACKET BOAT**, a vessel appointed by the government to carry the mail of letters, packets, and expresses, from one kingdom to another by sea, in the most expeditious manner. Thus, the packet boats, under the direction of the post-master-general of Great Britain, carry the mails from Dover to Calais, from Falmouth to Lisbon, from Harwich to Helvoetsluys, and from Parkgate to Dublin. See *POST*.

TO PA'CKET. *v. a.* (from the noun.) To bind up in parcels (*Swift*).

PA'CKHORSE. *s.* (*pack* and *horse*.) A horse of burden; a horse employed in carrying goods (*Locke*).

PA'CKSADDLE. *s.* (*pack* and *saddle*.) A saddle on which burdens are laid (*Howel*).

PA'CKTHREAD. *s.* (*pack* and *thread*.) Strong thread used in tying up parcels (*Add.*).

PAC'KWAX. *s.* The strong aponeuroses on the sides of the neck in brutes (*Ray*).

PACORUS, the eldest of the thirty sons of Orodes, king of Parthia, sent against Crassus, whose army he defeated, and whom he took prisoner. He supported the republican party of Pompey, and of the murderers of Julius Cæsar, and was killed in a battle by Ventidius Bassus, B. C. 39, on the same day (9th of June) that Crassus had been defeated.

PACOS, in zoology. See **CAMELUS**.

PACT. *s.* (*pact*, Fr. *pactum*, Latin.) A contract; a bargain; a covenant (*Bacon*).

PAC'TION. *s.* (*paction*, Fr. *pactio*, Lat.) A bargain; a covenant (*Hayward*).

PACTITIOUS. *a.* (*pactio*, Lat.) Settled by covenant.

PACTOLUS, in ancient geography, a celebrated river of Lydia, rising in mount Tmolus, and falling into the Hermus, after watering the city of Sardes. It was in this river that Midas washed himself when he turned into gold whatever he touched; and from that circumstance it ever after rolled golden sand, and received the name of Chrysorrhœas. It is called Tmolus by Pliny. Strabo observes, that it had no golden sands in his age.

PACUVIUS (M.), a native of Brundisium, who distinguished himself by his skill in painting and his poetical talents. His style was rough, and without purity or elegance. He retired to Tarentum, where he died in the 90th year of his age, about 131 years before Christ.

PAD. *s.* (from *paad*, Saxon.) 1. The road; a footpath (*Prior*). 2. An easy paced horse (*Dryden*). 3. A robber that infests the roads on foot. 4. A low soft saddle (*Hudibras*).

To PAD. *v. a.* (from the noun.) 1. To travel gently. 2. To rob on foot. 3. To beat a way smooth and level.

PADANG, a seaport on the west coast of Sumatra, in the East Indies, in the possession of the Dutch. In 1797, it was almost totally destroyed by an earthquake, and upward of 300 lives were lost. Lon. 99. 46 E. Lat. 0. 50 S.

PA'DAR. *s.* Grouts; coarse flower (*Wolt.*).

PA'DDER. *s.* (from *pad*.) A robber; a foot highwayman (*Dryden*).

To PA'DDLE. *v. n.* (*patouiller*, French.) 1. To row; to beat water, as with oars (*Gay*). 2. To play in the water (*Collier*). 3. To finger (*Shakspeare*).

PA'DDLE. *s.* (*pattal*, Welsh.) 1. An oar, particularly that which is used by a single rower in a boat. 2. Any thing broad like the end of an oar (*Deuteronomy*).

PA'DDLEK. *s.* (from *paddle*). One who paddles (*Ainsworth*).

PADDOCK. *s.* (*pada*, Sax.; *padde*, Dut.) A great frog or toad (*Dryden*).

PA'DDOCK. *s.* (corrupted from *parrack*.) A small enclosure for deer, or other animals.

PADDOCK, in earlier times, signified a pasture enclosed with a wall or paling of great height, a mile in length, and a quarter of a mile broad, in which deer were coured with

greyhounds, in the same manner as hares are coured at present, but subject to rules different from those now in use. These paddocks, from their great extent, were seldom seen but in the royal parks, or upon the demesnes of the most opulent. The sport has been a long time discontinued, and the word paddock is applied in the present time only to a small enclosure or pasture, having a pale to protect it; or to a small tract of land, surrounding, or appertaining to, a rural mansion, where a few brace of fallow deer may be kept, but not of magnitude sufficient to acquire the appellation of a park.

PADERBORN, a bishopric of Germany, in the circle of Westphalia, 32 miles long and 20 broad. In the middle of it are high mountains, and iron mines; but the rest of the country is fertile in corn and pastures. It is most remarkable for its bacon and venison.

PADERBORN, an ancient and populous town of Westphalia, capital of a bishopric. It takes its name from the rivulet Pader, which rises under the high altar of the cathedral. It has a celebrated university, and is 37 miles S. W. of Minden, and 43 E. S. E. of Munster. Lon. 8. 55 E. Lat. 51. 46 N.

PA'DLOCK. *s.* (*padde*, Dutch.) A lock hung on a staple to hold on a link (*Prior*).

To PA'DLOCK. *v. a.* (from the noun.) To fasten with a padlock (*Arbuthnot*).

M. Regnier has recently invented, or rather improved, a padlock of considerable security by means of combinations, of which the following is a description.

The intention of this padlock is to secure portmanteaus, cloak bags, and other packages in the most complete manner, and to serve occasionally as defences to the key-holes of the doors of apartments.

The padlock is composed of four circular pieces of brass, on which are engraven the twenty-four letters of the alphabet. The four pieces are moveable on their axes by turning them with the finger in order to produce the combination by which it is opened.

The combination of the manufacturer is the word **ROME**: when this word is brought into a correct line with the two marks on the edges of the two steel plates FF, which form the external part of the padlock, those two plates can be separated a little from each other, and the clasp of the lock can be opened by the hinge.

The same process is used to fasten it, with this difference, that the two external plates are pressed together so as to confine the bow of the clasp of the lock in its cell at G; after which, the combination is to be shifted so that the characters shall no longer form the same word in the before-mentioned line.

The method by which the possessor may dispose of the padlock to act by a new combination, which cannot be known to any other person:

1. A screw is taken out, which passes through the centre of the plates FF. (Plate 429, fig. 1.)

2. The combination which it is intended to

set aside, namely, that which opens the lock at present must be duly arranged.

3. The marked circular pieces or rings must be taken off from four plates of brass which constitute the central part, and together form the centre-piece of the mechanism.

4. Lastly, The rings must be replaced on the centre pieces, each according to the letter the possessor may have chosen.

For example: If you would adopt the word *lock* for the combination, the letter *L* of the first ring must be placed over or upon a small steel tooth, which is attached to the first interior cylinder; the letter *O* of the second ring on the tooth of the second cylinder; the letter *C* of the third ring on the tooth of the third cylinder; and lastly, the letter *K* of the fourth tooth on the fourth cylinder.

By this means the word *lock* is set up and becomes the combination of the lock, and the word *Rome* no longer produces the disposition of parts required for the disengagement.

After this operation the screw must be replaced in the centre of the plate; this screw does not contribute to the strength of the mechanism, but is used merely to allow the exact space necessary for opening the padlock, and to prevent the separation of the rings from the central parts in the common use of the lock.

Method of using this lock as a defence to the key-hole of a door.

A ring staple *A*, having a wood screw, is fixed to the door above the key-hole or escutcheon of the lock.

A second ring *C* is fixed perpendicularly beneath the other.

A cylindrical tube of iron *D*, in the form of a bolt, is placed vertically in the ring of these screw staples. At the lower end of the tube is an aperture, through which the padlock is inserted, so that the tube or bolt cannot be raised or taken out.

By this contrivance the key-hole of the lock is completely defended, and the introduction of a pick-lock or false key is rendered morally impossible. For the mechanism presents 331,776 combinations, (equal to the 4th power of 24,) forming 331,775 different obstacles to prevent the removal of this defence by any person unacquainted with the secret of the proprietor.

If it be apprehended that the word of the combination may be forgotten, it will be easy to write and disguise it in many different ways, without any risk of discovery: for example:

The letter <i>L</i> , or eleventh letter of the	<i>L</i> .
alphabet, will be written	- - 11
The letter <i>O</i> , or fourteenth letter	- - 14
The letter <i>C</i> , or third letter	- - 3
The letter <i>K</i> , or tenth letter	- - 10

Total (expressed) *L*. 38

This little calculation will appear to any other person to be a common account, but it is to the proprietor a memorandum by which he will perfectly recollect that the first letter of his combination is the eleventh of the alpha-

bet, that the second is the fourteenth, and so of the rest.

Mr. Nicholson, who published the preceding account in his *Philosophical Journal*, says, "I find some obscurity in Regnier's description of the manner of connecting the central piece and the external engraved part. From the operation, I apprehend, 1. that each ring has a number of notches at its inner surface, that answer to the letters on its outer face; 2. that each central round piece fits the cavity of its ring, and is prevented from turning by a tooth which it lodges in one of the notches; 3. that when all the four teeth are ranged in a line between *F* and *F*, the lock will open; and therefore, 4. when any particular letter is placed over the tooth, that letter becomes the effective letter for its own ring." See *Lock*.

PADRON, a town of Spain, in Galicia, seated on the Ulla, 12 miles S. of Compostella. Lon. 8. 17 W. Lat. 42. 40 N.

PADSTOW, a seaport in Cornwall, with a market on Saturday. It has some trade to Ireland, and is seated at the mouth of the Camel, on the Bristol Channel, 30 miles W. of Launceston, and 243 W. by S. of London. Lon. 4. 45 W. Lat. 50. 42 N.

PADUA, an ancient and celebrated city of Italy, capital of the Paduan, with a university and a bishop's see. It is seven miles in circumference, and much less considerable than formerly; for great part of the circuit within the walls is unbuilt, and the town in general so thinly inhabited, that grass is seen in many places, between the stones with which the streets are paved. The houses are built on piazzas, which, when the town was in a flourishing state, may have had a magnificent appearance; but they now rather give it a more gloomy air. The Franciscan church is dedicated to St. Antonio, the great patron of the city, whose body is inclosed in a sarcophagus, under an altar in the middle of the chapel, and is said to emit a very agreeable and refreshing flavour. Pious catholics believe this to be the natural effluvia of the saint's body; while heretics assert, that the perfume proceeds from certain balsams rubbed on the marble every morning, before the votaries come to pay their devotions. The walls of this church are covered with votive offerings of ears, eyes, arms, legs, noses, and every part almost of the human body, in token of cures performed by this saint; for whatever part has been the seat of the disease, a representation of it is hung up in silver or gold, according to the gratitude or wealth of the patient. Near this church is a place, called the school of St. Antonio, where many of the actions of the saint are painted in fresco; some of them by Titian. The church of St. Justina, built from a design by Palladio (one of the most elegant he ever gave) is remarkable for its rich Mosaic pavement. The hall of the town-house is one of the largest in Europe, and contains the cenotaph of Livy, the historian, who was a native of Padua. The university, once so celebrated, is now on the decline. Here is a cloth manufacture; and it

is said that the inhabitants of Venice wear no other cloth than what is made here. The city, however, swarms with beggars, who ask charity in the name of St. Antonio. Padua was taken by the Venetians, in 1706. It is seated on the Brenta and Bachiglione, in a fine plain, 20 miles S.E. of Vicenza, and 225 N. of Rome. Lon. 12. 1 E. Lat. 45. 22 N.

PADUANO, a province of Italy, in the territory of Venice, 40 miles long and 35 broad; bounded on the E. by the Dogado, on the S. by the Polesino di Rovigo, on the W. by the Veronese, and on the N. by the Vicentino. Its soil is well watered, and is one of the most fertile in Italy. Padua is the capital.

PADULA, a town of Naples, in Principato Citereio, 14 miles N. of Policastro. Lon. 15. 41 E. Lat. 40. 29 N.

PADUS. The wild cluster cherry, or bird's cherry. *Prunus padus* of Linnæus. The bark and berries of this shrub are used medicinally. The former, when taken from the tree, has a fragrant smell, and a bitter, sub-astringent taste, somewhat similar to that of bitter almonds. Made into a decoction, it cures intermittents, and it has been recommended in the cure of the several forms of siphylis. The latter are said to cure the dysentery.

PADUS, in ancient geography, the Po.

PÆAN, among the ancient pagans, was a song of rejoicing sung in honour of Apollo, chiefly used on occasions of victory and triumph. See **APOLLO**.

PÆAN, in the ancient poetry, a foot consisting of four syllables; of which there are four kinds, the *pæan primus*, *secundus*, &c. The *pæan primus* consists of one long syllable and three short ones, or a trochæus and pyrrhichius, as *temporibus*; the *pæan secundus* consists of a short syllable, a long, and two short, or an iambus and a pyrrhichius, as *potentia*; the *pæan tertius* consists of two short syllables, a long and a short one, or a pyrrhichius and a trochæus, as *animatus*; the *pæan quartus* consists of three short syllables and a long one, or a pyrrhichius and iambus, as *celeritas*.

PÆDERIA. In botany, a genus of the class pentandria, order monogynia. Corol twisted; berry empty, brittle, two-seeded; style bifid. Two species; climbing plants of India and the Mauritius.

PÆDEROTA. In botany, a genus of the class diandria, order monogynia. Corol ringent, four-cleft, with a naked throat; calyx five-parted; capsule two-celled. Three species; natives of Italy, Austria, and Carniola.

PÆDERUS. In entomology, a Fabrician tribe of the genus **STAPHYLINUS**, which see.

PÆDO-BAPTISM. (a compound of *παις*, *paîs*, *vaîdos*, infant, and *βαπτισμός*, baptism.) Infant baptism, or that conferred on children.

PÆDO-BAPTISTS, (formed of *παις*, *paîs*, *vaîdos*, infant, and *βαπτίζω*, I baptize,) are those who maintain that baptism should be administered to infants.

PÆFENHOFFEN, a town of France, in the department of Lower Rhine, seated on the declivity of a mountain, near the river Motter, eight miles W. of Hagnenau. Lon. 7. 38 E. Lat. 48. 48 N.

PÆONIA. *Pæony*. In botany, a genus of the class polyandria, order digynia. Calyx five-leaved; petals five; styleless; capsules many-seeded. Seven species; European plants, chiefly of Siberia. The two following are cultivated.

1. *P. tenuifolia*. Slender-leaved *pæony*. Leaves twice-ternate; leaflets many-parted, naked, with linear, subulate segments; capsules downy; germs two or three, purplish, with purple hairs. Siberia.

2. *P. officinalis*. Common *pæony*. Leaves decompound, naked; leaflets lobed, the lobes broad, lanceolate; capsules nearly erect, downy.

Of this there are two principal varieties, distinguished, but improperly, on the authority of C. Bauhin, into male and female *pæony*. The flowers of the former are large and single, composed of five or six large, roundish, red petals. Those of the latter smaller, and of a deep purple colour. The flowers of both sorts appear in May; and are natives of Switzerland. The single sorts are easily raised by seeds, and the double by parting the roots. The seeds should be sown in autumn, soon after they are perfectly ripe. The roots of the old double-flowered plants may be taken up in the beginning of autumn, and divided so as to have one bud or eye or more to each part or crown, without which they will never form good plants.

This plant, both male and female, has been long considered as a powerful medicine; and till of late years had a place in the materia medica of the London College.

The roots and seeds of *pæony* have, when fresh, a faint, unpleasant smell, somewhat of the narcotic kind, and a mucilaginous, sub-acrid taste, with a slight degree of bitterness and adstringency. In drying, they lose their smell, and part of their taste. Extracts made from them by water are almost insipid, as well as inodorous; but extracts made by rectified spirit are manifestly bitterish, and considerably adstringent. The flowers have rather more smell than any of the other parts of the plant, and a rough sweetish taste, which they impart, together with their colour, both to water and spirit.

The roots, flowers, and seeds of *pæony* have been esteemed in the character of an anodyne and corroborant, but more especially the roots; which since the days of Galen have been very commonly employed as a remedy for the epilepsy. For this purpose, it was usual to cut the root into thin slices, which were to be attached to a string, and suspended about the neck as an amulet; if this failed of success, the patient was to have recourse to the internal use of this root, which Willis directs to be given in the form of powder, and in the quantity of a drachm, two or three times a day, by which, as we are informed, both infants and

adults were cured of this disease. Other authors recommended the expressed juice to be given in wine, and sweetened with sugar, as the most effectual way of administering this plant. Many writers, however, especially in modern times, from repeated trials of the pæony in epileptic cases, have found it of no use whatever; though professor Home, who gave the radix pæonia to two epileptics at the Edinburgh infirmary, declares that one received a temporary advantage from its use. Of the good effects of this plant in other disorders we find no instances recorded. See Nat. Hist. Pl. XCIII.

PÆONY. In botany. See **PÆONIA**.

PAGAN. (*paganus*.) A heathen, gentile, or idolater, one who adores false gods.

Baronius derives the word *paganus* a *pagis*, villages, because, when Christians became masters of the cities, the heathens were obliged, by the edicts of Constantine and his sons, to go and live in the country villages, &c. Salmasius will have the word come from *pagus*, considered as originally signifying *gens*, or nation: whence, he observes, we say indifferently, pagans or gentiles.

The abbot de Fleury gives another origin of pagan: he observes, that the emperor Constantine, going from Antioch, against Maxentius, in 350, assembled all his troops, and advised such as had not received baptism to receive it immediately; declaring withal, that such as should be found unbaptized should quit the service, and go home.

Hence, perhaps, says the abbot, the name pagan might be given to those who chose the latter; the Latin word *paganus* properly signifying a person who does not bear arms, in opposition to *miles*, a soldier.

And hence it might, in time, extend to all heathens. Or, continues he, the word might come from *pagus*, village, in regard the peasants were those who adhered longest to the idolatry of the heathens.

PAGAN. a. Heathenish (*Shakspeare*).

PAGAN (Blaise Francis, count de), a French mathematician; born in Provence, 1604. He entered into the army, and at the siege of Montauban lost his left eye by a musket shot. At the passage of the Alps, and at the siege of Suza, he led on his soldiers to glory, and went in 1642 with the rank of field-marshal to Portugal. Here he had the misfortune to lose his eye-sight by a distemper, and with the world thus closed upon him he retired to study and meditation. The mathematics and fortification were his favourite pursuits, and he wrote a treatise on fortification; geometrical theorems; astronomical tables; theory of the planets; historical relation of the Amazon river, 8vo.; *homme heroïque*, &c. He died at Paris, 1665.

PAGANALIA, certain festivals observed by the ancient Romans in the month of January. They were instituted by Servius Tullius, who appointed a certain number of villages (*pagi*), in each of which an altar was to be raised for annual sacrifices to their tutelary gods; at which all the inhabitants were to assist, and

give presents in money, according to their sex and age, by which means the number of country-people was known. The servants upon this occasion offered cakes to Ceres and Tellus, to obtain plentiful harvests.

PAGANELLUS, in ichthyology. See **Gobi**.

PAGANISM, the religious worship and discipline of pagans: or, the adoration of idols and false gods. See **IDOLATRY**, **MÛTHOLOGY**, and **POLYTHEISM**.

PAGE. *s.* (*page*, French.) 1. One side of the leaf of a book (*Watts*). 2. (*page*, Fr.) A young boy attending on a great person.

To PAGE. *v. a.* (from the noun.) 1. To mark the pages of a book. 2. To attend as a page (*Shakspeare*).

PAGE OF A LEAF (*Superior—inferior*): (*Pagina, superior—inferior folii*.) In botany, the upper and lower surface of a leaf: the supine and prone disk, as it is sometimes expressed.

PAGEANT. *s.* 1. A statue in a show. 2. Any show; a spectacle of entertainment (*Shakspeare*). 3. Any thing showy without stability or duration (*Pope*).

PAGEANT. *a.* Showy; pompous; ostentatious; superficial (*Dryden*).

To PAGEANT. *v. a.* (from the noun.) To exhibit in show; to represent (*Shakspeare*).

PAGEANTRY. *s.* (from *pagant*.) Pomp; show (*Government of the Tongue*).

PAGET (William lord), though but the son of a serjeant at mace, was noticed by Henry VIII. and made successively clerk of the signet, of the council, and afterwards of the privy seal. He afterwards went ambassador to France, and was soon after made secretary of state. He was ambassador to Charles V. in the next reign; but his intimacy with Somerset proved injurious to his interests, and he shared his disgrace, and was fined 6000*l*. He died 1564.

PAGI (John Baptist), of Genoa, author of a treatise on painting, in Italian, fol. was eminent not only as a painter, but as an engraver, and died at Genoa 1629, aged 74.

PAGI (Anthony), an able critic, born at Rognà, in Provence, 1624. His great work is a critique on the annals of Baronius, a most valuable performance. He wrote besides a Latin dissertation on the consular office, and other things, and died at Aix 1699.

PAGI (Francis), nephew to the preceding, was born at Lambesc in Provence, 1654. He followed his uncle's example, and greatly assisted him by his learning in the completion of his critique on Baronius, of which he published the three last volumes. He wrote besides in Latin an history of the popes, 4 vols. 4to. He died 1721. His nephew was also a man of letters, and published a history of Cyrus the Younger, 12mo, &c.

PAGINAL. *a.* (*pagina*, Lat.) Consisting of pages (*Brown*).

PAGLIANO, a town of Naples, in Abruzzo Ulteriore, 115 miles E.S.E. of Aquila. Lon. 13. 46 E. Lat. 42. 28 N.

PAGO, an island in the gulf of Venice, separated from Venetian Dalmatia by a narrow strait. The air is cold, and the soil barren; but it is well peopled, and contains salt works. Lon. 15. 11 E. Lat. 44. 40 N.

PAGOD, or **PAGODA**, a name whereby the East Indians call the temple in which they worship their gods. Before they build a pagod they consecrate the ground as follows: after having inclosed it with boards or palisades, when the grass is grown on the ground they turn an ash-coloured cow into it, who stays there a whole day and night; and as cow-dung is thought by the Indians to be of a very sacred nature, they search for this sacred deposit, and having found it, they dig there a deep pit, into which they put a marble pillar, rising considerably above the surface of the earth. On this pillar they place the image of the god to whom the pagod is to be consecrated. After this the pagod is built round the pit, in which the pillar is fixed. The pagod usually consists of three parts: the first is a vaulted roof supported on stone or marble columns. It is adorned with images, and, being open, all persons without distinction are allowed to enter it: the second part is filled with grotesque and monstrous figures, and nobody is allowed to enter it but the bramins themselves: the third is a kind of chancel, in which the statue of the deity is placed: it is shut up with a very strong gate.

The word is sometimes used for the idol, as well as for the temple.

PAGOD is also the name of a gold coin, current in several parts of the Indies, on the footing of the piece of eight. The English coin pagods at Fort St. George, and the Dutch at Palicate.

There are also silver pagods struck at Narisingua, Bisnagar, &c. which usually bear the figure of some monstrous idol: whence their names. They are of various values.

PAGURUS. In the entomological system of Fabricius, a tribe of the genus **CANCER**, which see.

PAID. The pret. and part. passive of *pay*.

PAIGLE. *s.* A flower, also called cow-slip.

PAIL. *s.* (*paila*, Spanish.) A wooden vessel in which milk or water is commonly carried.

PAILFUL. *s.* (*pail* and *full*.) The quantity that a pail will hold (*Shakspeare*).

PAILMAIL. *a.* Violent; boisterous (*Digby*).

PAIN. *s.* (*peine*, French.) 1. Punishment denounced (*Sidney*). 2. Penalty; punishment (*Bacon*). 3. Sensation of uneasiness (*Bacon*). 4. (In the plural.) Labour; work; toil. 5. Labour; task (*Spenser*). 6. Uneasiness of mind; anxiety (*Prior*). 7. The throws of childbirth (*Samuel*).

To **PAIN**. *v. a.* (from the noun.) 1. To afflict; to torment; to make uneasy (*Jeremiah*). 2. To labour (*Spenser*).

PAINBOEUF, a seaport of France, in the

department of Lower Loire, at the mouth of the Loire. Hence all the ships belonging to Nantes take their departure, and here they anchor on their arrival. It is 20 miles W. of Nantes. Lon. 1. 53 W. Lat. 47. 15 N.

PAINFUL. *a.* (*pain* and *full*.) 1. Full of pain; miserable; beset with affliction (*Mil.*). 2. Giving pain; afflictive (*Addison*). 3. Difficult; requiring labour (*Shakspeare*). 4. Industrious; laborious (*Dryden*).

PAINFULLY. *ad.* (from *painful*.) 1. With great pain or affliction. 2. Laboriously; diligently (*Raleigh*).

PAINFULNESS. *s.* (from *painful*.) 1. Affliction; sorrow; grief (*South*). 2. Industry; laboriousness (*Hooker*).

PAINIM. *s.* (*payen*, French.) Pagan; infidel (*Peacham*).

PAINIM. *a.* Pagan; infidel (*Milton*).

PAINLESS. *a.* (from *pain*.) Free from pain; void of trouble (*Dryden*).

PAINSTAKER. *s.* (*pains* and *take*.) Labourer; laborious person (*Gay*).

PAINSTAKING. *a.* (*pains* and *take*.) Laborious; industrious.

PAINSWICK, a town in Gloucestershire, with a market on Tuesday. It has a manufacture of white cloths for the army, and for the India and Turkey trade; and hence is brought a stone, remarkable for its beauty and neatness, for the pavement of floors. Painswick is situate so high, as every way to command extensive views over a vale of vast richness and variety, of the windings of the Severn, Malvern Hills, and parts of the counties of Salop, Hereford, and Monmouth. It is seven miles S.E. of Gloucester, and 101 W. by N. of London. Lon. 2. 11 W. Lat. 52. 46 N.

To **PAINT**. *v. a.* (*peindre*, French.) 1. To represent by delineation and colours. 2. To cover with colours representative of something (*Shakspeare*). 3. To represent by colours, appearances, or images (*Locke*). 4. To describe; to represent (*Shakspeare*). 5. To colour; to diversify (*Spenser*). 6. To deck with artificial colours (*Shakspeare*).

To **PAINT**. *v. n.* To lay colours on the face (*Pope*).

PAINT. *s.* (from the verb.) 1. Colours representative of any thing. 2. Colours laid on the face (*Anon.*).

PAINT, a term used to express more particularly the preparations employed in painting houses.

The principal article in the various compounds being white lead, the grinding of which is extremely detrimental to health, we shall state the following process, lately invented by M. A. A. De Vaux, and communicated for the benefit of the public: should it prove to be an effectual substitute for the pernicious paint now employed, it will be of inestimable service to society. He directs two Paris pints of sweet skimmed milk (two quarts English measure); six ounces (6½ ounces English averdupois) of fresh slaked lime; four ounces of nut, caraway, or linseed oil, and three

pounds of Spanish white, to be used in the composition. The lime must first be introduced into a stone vessel; to which should be added such a proportion of milk as will produce a mixture resembling thin cream. Next, the oil is to be gradually poured in; the whole being gently stirred, and the remainder of the milk added. The Spanish white must next be crumbled in, or scattered on the surface of the fluid, which it gradually imbibes, and at length sinks; when the whole should be briskly agitated.

M. De Vaux observes, that the milk ought not to be sour; because, in such case, it would form with the lime a calcareous acetite, which strongly attracts moisture. Either of the oils above-mentioned may be used; but, if white paint be required, that of caraways is preferable; as it is perfectly transparent.—In order to obtain a distemper or size-colour, the paint thus prepared may be tinged with levigated charcoal, yellow ochre, &c. for painting with which, the most common oils may be used.

The quantity here prescribed is, farther, stated to be sufficient for the first coat of six toises, or from twenty-four to twenty-seven square English yards: it may be applied in the usual manner; and costs in Paris the sum of nine sols, or 4½d. sterling.

PAINTED LADY. In botany. See **DIANTHUS**.

PAINTED LADY PEA. See **LATHYRUS**.

PAINTER. *s.* (*peintre*, French.) One who professes the art of representing objects by colours (*Dryden*).

PAINTING, is the art of representing all objects of nature visibly, by lines and colours on a plain surface. It has also the power of expressing by the same means conceptions and images of the mind which do not actually exist in any of the usual forms of nature. It is to be considered as an art displaying either conjointly or separately the powers of imagination and imitation: and may be divided into invention, which regards the original thought or conception of the subject; and into composition, design, and colouring, which regard the execution of the work.

Invention consists generally in the choice of such subjects as are best calculated to answer some great and interesting end; and particularly in discovering or selecting such subjects as are capable of being most appropriately expressed by painting, and of producing a powerful effect by such means as are distinctively placed within the compass of that art.

Composition regards the arrangement of the subject both as to forms, and to the general effects of light and shade, and of colour. It comprehends the general distribution and grouping of the figures, their combination or contrast, the choice of attitudes, the disposal of draperies, the situation of the scene itself, as well as the distribution and connection of all the various parts of scenery and ornament.

The important objects which design embraces will be found fully explained under that article. See **DESIGN**.

Colouring regards, first, the infinite variety of hues with which nature distinguishes her forms,

agreeably to the degree and mixture of the rays of light which their surfaces reflect: and, secondly, the distribution, apposition, and accompaniment, of various hues or tints, so as to produce the effect most pleasing to the sight, a circumstance in which nature always delights.—It embraces also the light and shade of objects, as far as by the diminution or increase of these the harmony of tints before-mentioned can be effected; but that mixed effect of colour and of light and shade which is denominated *chiaroscuro*, is more justly regarded as a branch of composition.

As all the objects of nature are susceptible of imitation by the pencil, the masters of this art have applied themselves to different subjects, each one as his talents; his taste, or inclination, may have led him. From whence have arisen the following classes.

I. *History-painting*: which represents the principal events in history sacred and profane, real or fabulous; and to this class belongs allegorical expression. These are the most sublime productions of the art; and in which Raphael, Guido, Rubens, Le Brun, &c. have excelled.

II. *Rural history*; or the representation of a country life, of vil ages and hamlets, and their inhabitants. This is an inferior class; and in which Teniers, Breughel, Watteau, Morland, &c. have great reputation, by rendering it at once pleasing and graceful.

III. *Portrait-painting*; which is an admirable branch of this art, and has engaged the attention of the greatest masters in all ages, as Apelles, Guido, Vandyke, Rembrandt, Regaids, Pesnee, Kneller, La Tour, &c.

IV. *Grotesque histories*; as the nocturnal meetings of witches; sorceries and incantations; the operations of mountebanks, &c.; a sort of painting in which the younger Breughel, Teniers, and others, have exercised their talents with success.

V. *Battle-pieces*; by which H. Chetemberg, Wouwerman, &c. have rendered themselves famous.

VI. *Landscapes*; a charming species of painting, that has been created by masters of the greatest genius in every nation.

VII. *Landscapes diversified with waters*; as rivers, lakes, cataracts, &c.; which require a peculiar talent, to express the water sometimes smooth and transparent, and at others foaming and rushing furiously along.

VIII. *Sea-pieces*; in which are represented the ocean, harbours, and great rivers; and the vessels, boats, barges, &c. with which they are covered; sometimes in a calm, sometimes with a fresh breeze, and at others in a storm. In this class Backhuysen, Vanderveide, Blome, and many others, have acquired great reputation.

IX. *Night-pieces*; which represent all sorts of objects, either as illuminated by torches, by the flames of a conflagration, or by the light of the moon. Schalck, Vanderneer, Vanderpool, &c. have here excelled.

X. *Living animals*: a more difficult branch of painting than is commonly imagined; and in which Rosa, Carré, Vanderveide, and many others, have succeeded marvellously well.

XI. *Birds of all kinds*; a very laborious species, and which requires extreme patience minutely to express the infinite variety and delicacy of their plumage.

XII. *Culinary-pieces*; which represent all sorts of provisions and animals without life, &c. A

P A I N T I N G.

species much inferior to the rest, in which nature never appears to advantage, and which requires only a servile imitation of objects that are but little pleasing. The painting of fishes is naturally referred to this class.

XIII. *Fruit-pieces*, of every kind, imitated from nature.

XIV. *Flower-pieces*; a charming class of painting, where art in the hands of Huyzsum, P. Segerts, Merian, &c. becomes the rival of nature. Plants and insects are usually referred to the painters of flowers, who with them ornament their works.

XV. *Pieces of architecture*; a kind of painting in which the Italians excel all others. Under this class may be comprehended the representations of ruins, sea-ports, streets, and public places: such as are seen in the works of Caneletti, and other able masters.

XVI. *Instruments of music, pieces of furniture*, and other inanimate objects; a trifling species, and in which able painters only accidentally employ their talents.

XVII. *Imitations of bas reliefs*; a very pleasing kind of painting, and which may be carried by an able hand to a high degree of excellence.

XVIII. *Hunting-pieces*; these also require a peculiar talent, as they unite the painting of men, horses, dogs and game, to that of landscapes.

We shall not here attempt to prescribe rules for the art of painting. Good masters, academies of reputation, and a rational practice, are the only true sources from whence the young painter must derive the detail of his art; and for this reason we shall avoid enlarging on that part of painting of which words are incompetent to convey an idea. It will be more interesting to the general reader, if we here give a brief history of the rise and progress of painting, and of the different schools, in ancient and modern times.

It is to be imagined that men must naturally, and very early, have conceived an idea of the first principles of the art of painting; the shadow of each plant and animal, and of every object in nature, must have afforded them the means of conceiving, and pointed out the possibility of imitating, the figures of all bodies. Thus the savage nations, an emblem of what men were in the infancy of society, possess the first rudiments of this art, even before those which are useful and almost necessary to existence; their naked bodies are covered with punctures of various forms, into which they infuse indelible colours. The next demand for this art is to preserve the memory of warlike exploits. It is more natural to form some representation of an action, than to give an account of it by means of arbitrary characters. Hence the picture-writing of the Mexicans, and the more artful hieroglyphics of Egypt.

Painting consisted of simple outlines long before the expression of relief or the application of colour. It was simply drawing; and the master-pieces of painting in that rude period were not superior to the sports of children. Although occupied about a single point, it was not brought to perfection: for constant experience instructs us that men never excel in the inferior parts of an art till they are capable of carrying the whole to perfection.

After employing for a long time those simple outlines, the next step in the art of painting was to make the imitation more complete, by applying

colours: this was first accomplished by covering the different parts of the figure with different colours in the same way that we colour maps; and several nations, as the Egyptians, the Chinese, and the different nations of India, have never painted in a better manner. Other nations, more ingenious and more attentive to the arts, observing that the objects of nature have relief, have invented what is called *claro-obscuro*. The Greeks, the most ingenious, penetrating, and delicate of all, invented this part antecedent to colours; than which there cannot be a greater proof of their exquisite taste, as the glare of colours without judgment excites more admiration in the minds of the vulgar and ignorant, than the *camaieu* or drawings of one colour executed by the most skillful artist.

These general observations concerning the gradual improvement of this art will be best illustrated by a more particular attention to the ancient nations in which it flourished.

Plato, who lived 400 years before the Christian era, informs us that painting had been practised in Egypt for ten thousand years; that some of the productions of that high antiquity were in existence; and that they bore an exact resemblance to those which the Egyptians executed in his time. Without regarding the period of ten thousand years mentioned by Plato, it is reasonable to consider it as an indeterminate period, which carries us back to very remote antiquity.

The figures either in the painting or sculpture of Egypt were extremely stiff; the legs were drawn together, and their arms were pasted to their sides. It appears that their only model was their mummies, and that their skill in anatomy was derived from embalming them. They were extremely incorrect in every part of the head; they placed the ears much higher than the nose. Besides, they gave the face the form of a circle instead of an oval; the chin was short and rounded; the cheeks excessively so; and they turned upwards the corners of the mouth and eyes. Many of these faults may be ascribed to the formation of the human face in Egypt; but the placing of the ears could only be founded in caprice or ignorance.

The exactness of the Egyptian proportion is much celebrated; but although we grant that they observed the proper length of the different parts of the human body, they were still defective artists, since they did not observe the breadth, and were moreover ignorant altogether of the shape and size of the muscles. Works converted to religious purposes chiefly occupied the Egyptian painters. They had figures for imitation from which they would not depart, and those figures were monstrous; the bodies of animals with the heads of men; the bodies of men with the heads of animals: or, if the figure was more agreeable to nature in its parts, yet it was so deformed and imaginary, as to have nothing similar to it as a whole in the creation of God.

The monuments of Egyptian painting with which we are best acquainted (says Winklemann) are the chests of mummies. These works have resisted the injuries of time, and are still submitted to the examination of the curious. The white, made of white lead, is spread over the ground of the piece; the outlines of the figure are traced with black strokes, and the colours are four in number; namely, blue, red, yellow, and green, laid on without any mixture or shading. The red and blue prevail most; and those colours

PAINTING.

seem to have been prepared in the coarsest manner. The light is formed by leaving those parts of the ground where it is necessary, covered with the white lead, as it is formed by the white paper in some of our drawings. This description is sufficient to convince us that the whole art of painting in Egypt consisted in colouring; but every person knows, that without tints and the mixture of colours, painting can never arrive at great perfection.

In Upper Egypt there seems to have existed a kind of colossian painting, which has never been examined except by travellers who were no great critics in the art. Winklemann had some reason to express a desire that those remains of antiquity, with regard to the manner of working, the style, and the character, had been accurately explored. Walls of 24 feet in height, and pillars of 32 feet in circumference, are wholly covered with those colossian figures. According to Norden they are coloured in the same manner with the mummies: the colours are applied to a ground prepared in manner of fresco; and they have retained their freshness for many thousand years. Winklemann adds, that all the efforts of human skill and industry could make as little impression on them as the injuries of time. His enthusiasm for antiquity has perhaps led him into this extravagant exaggeration.

It appears that the great employment of the Egyptian painters was on earthen vessels, on drinking cups, in ornamenting barges, and in covering with figures the chests of mummies. They painted also on cloth; but painting, as an industrious occupation, supposes a workman, not an artist: the decoration of temples, house-painting, and that of the figures relative to religion, are to be considered only in this point of view. The workmen in Russia who paint our Saviour holding the globe in one hand, and blessing the people with the other, are not members of the imperial academy of fine arts.

Pliny informs us that the Egyptian artists painted also the precious metals; that is to say, they varnished or enamelled them. It is doubtful what this art was, but most probably it consisted in covering gold or silver with a single colour.

The Egyptians are supposed to have continued this coarse style till the reign of the Ptolemies.

The Persians were so far from excelling in the arts, that the paintings of Egypt were highly esteemed among them after they had conquered that country.

The carpets of Persia were of great value in Greece, even in the time of Alexander the Great, and these were adorned with various figures; but this is no proof that they were well executed, any more than a demand for several of the Chinese productions is at present a proof of the taste of that people in the arts. It was the fabrication of the silk, and not the truth of the representation, which made the Greeks admire the carpets of Persia.

The Persians, as well as the Arabians, had some knowledge of Mosaic work. This is only valuable when it copies, in a manner that cannot be destroyed, the works of a great master; but if the Persians had no good pictures to copy into Mosaic, it was of no consequence to be able to arrange, in a solid manner, pieces of flint one beside another.

There is only one Persian painter whose name has descended to posterity; and he is preserved, not because he was a painter, but because he ac-

commodated the ancient doctrine of the two principles to the Christian religion. Besides, it is doubted whether Manes was a Persian or a Greek, and it is still less known whether he was a painter. He is praised in Asia for drawing straight lines without a ruler.

The modern Persians have made no kind of progress in the arts. The emperor Schah-abbas, wishing from caprice to be instructed in drawing, was obliged to have recourse to a Dutch painter who happened to be in his dominions.

The modern Persians paint on cloth, and the artists in India are their rivals in this branch of industry; but their paintings are purely capricious. They represent plants and flowers which have no existence in nature; and their only merit consists in the brightness and the strength of their colours.

Besides this, the art in India, as it was in the most remote antiquity, is confined to monstrous figures connected with their religion, animals not to be found in the world, and idols with a multitude of arms and heads, which have neither exactness in their forms nor proportions. See **POLYTHEISM**.

The paintings of Thibet discover great patience in the artist, and are remarkable for the fineness of their strokes. Their painters might dispute with Apelles and Protogenes for extreme tenuity of pencil; but it is in this alone, without any regard to the art, in which their merit consists.

Some of the idols in Thibet are executed in a certain style of relieve; but those productions are not only imperfect, they are also so destitute of beauty as to forbid every hope of excellence in the art. The same thing may be observed with regard to many of the eastern nations; they seem to have that want of style which would for ever condemn them to mediocrity, even if they should happen to arrive at it.

An obscure Italian painter, named Giovanni Ghirardini, who travelled into China, whose judgment is more to be depended on in an art which he practised than that of other travellers, declares that the Chinese have not the least idea of the fine arts; and this opinion is confirmed by every thing which we know of that people.

The Chinese seem not to have the smallest conception of perspective. Their landscapes have no plan, no variety in the appearance of the clouds, and no diminishing of the objects in proportion to their distance.

The great object of their painting seems to consist in making their figures as unlike nature as possible: it is a serious caricature of the human figure.

To make the art flourish, it is necessary that the artist be esteemed and rewarded. In China, there is no artist so poorly paid as the painter.

The ignorant admire the brightness and purity of their colours; but simple colours appear always bright and pure: the difficulty of the art consists in melting them into one another in such a manner that the mixture shall not be perceived. It must at the same time be confessed, that their natural colours are more brilliant than ours; but if there be any merit in this, it is to be ascribed to their climate, not to their ability.

A Jesuit missionary, who in his youth had been a grinder of colours, was raised to the greatest eminence as a painter in the imperial court of China, and Raphael himself was never so much respected. The Chinese battles sent from that

PAINTING.

country to Paris to be engraved, are the works of the Jesuits; and except they were done by the Chinese themselves, it is impossible to conceive that they could be worse executed.

The Chinese, like other eastern nations, have a few simple strokes which they repeat in all their variety of figures. In the figures on the earthenware, they discover no knowledge of forms, no expression of the most conspicuous muscles, and no idea of proportion. And in all the paintings of China, anatomy seems to bear no relation to the art. Some heads done by a Chinese painter have a sort of resemblance to nature, but they are in a low and vicious taste: the fulness of the drapery conceals the parts in such a manner that they do not seem to exist under it. Sculpture in China is in a state of no great perfection, but at the same time it is better executed than their paintings.

The ancient inhabitants of Etruria, now called Tuscany, were the first who connected the arts with the study of nature. In some of their monuments which still remain there is to be observed a first style, which shows the art in its infancy; and a second, which, like the works of the Florentine artists, shows more of greatness and exaggeration in the character than precision or beauty.

Pliny says that painting was carried to great perfection in Italy before the foundation of Rome; perhaps he means in comparison with the infancy of the art in Greece at that period; but it appears that even in his time the painters of Etruria were held in great reputation.

The only Etrurian paintings which remain have been found in the tombs of the Tarquins. They consist of long painted friezes, and pilasters adorned with huge figures, which occupied the whole space from the base to the cornice. These paintings are executed on a ground of thick mortar, and many of them are in a state of high preservation.

Winklemann is of opinion that the Greek colonies established at Naples and Nola had at a very early period cultivated the imitative arts, and taught them to the Campanians established in the middle of the country. This learned antiquarian considers as work purely Campanian, certain medals of Capua and Teanum, cities of Campania into which the Greek colonies never penetrated. The head of a young Hercules, and the head of a Jupiter, according to Winklemann, are executed in the finest manner. It is still a question, however, in the learned world, whether these medals owe their existence to Carthage or to Campania.

"But there have been discovered (adds Winklemann) a great number of Campanian vases covered with painting. The design of the greatest part of these vases (says he) is such, that the figures might occupy a distinguished place in a work of Raphael. Those vases, when we consider that this kind of work admits of no correction, and that the stroke which forms the outline must remain as it is originally traced, are wonderful proofs of the perfection of the art among the ancients." Winklemann had an opportunity of examining a very fine Campanian vase, on which was painted a burlesque representation of the loves of Jupiter and Alcmena. But as this must have been derived from some fragment of a Grecian comedy, the count de Caylus is persuaded that the Campanian vases are of Greek origin.

Although the history of Greek painting be more fully known than that of the same art among the barbarous nations, it is nevertheless involved

in much obscurity. Pliny is almost the only author who has preserved the materials of its history; and he complains, that on this occasion the Greek writers have not discovered their usual exactness. They place, says he, the first painter of whom they speak in the 90th Olympiad, 420 years before the Christian era. It is certain that painting in dry colours existed at the time of the siege of Troy, or at least when Homer wrote the account of it. The buckler of Achilles is a sufficient proof that the Greeks were then acquainted with the basso-relievo; a kind of sculpture which bears a near affinity to painting.

In the Iliad, Helen is represented as working at a tapestry, whereon she figured the numerous combats of which she was the cause. When Andromache was informed of her husband's death, she was occupied in representing on tapestry flowers of various colours. From these facts, it is certain that painting was not confined to simple strokes, nor even to the camaieu; and hence it is reasonable to conclude, that what is called lincary painting was practised long before the time of Homer. Polygnotus of Thasos, who lived about 420 years before the Christian era, was the first painter of any eminence in Greece. Pliny informs us that he was the first who clothed his female figures, who varied the colours of the different parts of their dress, or who opened their mouths in such a manner as to show their teeth. Aristotles, who flourished in a subsequent period, allows this painter to have excelled in expression. But the art of painting may be still considered in its infancy in Greece; till about 400 years before the Christian era, when Zeuxis and Parrhasius flourished. In the contest between these eminent painters, Zeuxis declared himself to be overcome, because in a cluster of grapes which he painted he had deceived the birds; whereas Parrhasius in a curtain which he executed deceived his rival. The principal works of Zeuxis are his Penelope, in which, according to Pliny, he appears to have expressed the manners of that princess; a Jupiter surrounded by the gods; a Hercules strangling the serpents in the presence of Amphitrion and Alcmena; an Helen and a Marsyas bound. From this enumeration of these works, and from the fame which they have acquired, it is evident that the difficult parts of the art, and those which in the execution render it estimable, were now begun to be studied. By Apelles, Protogenes, and Euphranor, it was carried to the greatest height of perfection. Grace, and symmetry, and proportion, and illusion, were now added by the greatest masters to the noblest objects of nature.

We have already seen, that before the foundation of Rome the arts were cultivated in Etruria. They were also early introduced into Latium; but whether that country employed its own artists or those of Etruria, remains altogether uncertain. One need not be astonished, that at a period when the arts were in their infancy in Greece, they were raising statues to their kings in Rome: but at that period all their artists were Etrurians or Latins; and when they conquered Italy, they made all the nations of it as barbarous as they were themselves.

In the year 259 from the building of the city of Rome, and 494 years before the Christian era, Appius Claudius consecrated a number of shields in the temple of Bellona, which contained in basso-relievo the portraits of his family. This example was followed; and in process of time it was common among the Romans to place those images in

PAINTING.

private houses. The execution in basso-relievo is a proof that they had an idea of painting, at least with one colour. As long as the Romans employed artists of other nations, they had little desire to cultivate the arts; but towards the year of Rome 450, and 303 years before Christ, one of the Fabii thought it no discredit to a noble family to employ himself in painting. He painted the temple of Safety; and his works remained till that temple was destroyed by fire, in the reign of Claudius. It is worthy of remark, that the same man was the first painter and the first historian in his country.

The example of Fabius, surnamed Pictor from his profession, did not excite his fellow-citizens to imitation. A century and a half elapsed before the tragic poet Pacuvius, nephew of Ennius, painted the temple of Hercules in the *forum boarium*. The glory which he had acquired by his dramatic works shed some lustre on the art, which he condescended to exercise; but did not confer on it that respect which could recommend it to general practice. The paintings of Fabius were the works or rather the recreations of his youth; those of Pacuvius, the amusements of his old age; but painting is a difficult art, which requires the whole attention, and which can never be prosecuted with success, except those who love it are solely devoted to the performance.

It appears that there were no eminent painters at Rome till the time of the emperors; but as the national spirit was changed, the profession of the fine arts acquired more respectability. The Romans, during the time of the republic, were animated with the spirit of liberty and the desire for conquest. When these two passions were weakened, the love of the arts obtained among them. As a proof of this it is sufficient to say, that Nero himself gloried in being an artist. A colossian picture of 120 feet was painted at Rome by the command of this emperor, which was afterward destroyed by lightning. The name of the painter is not recorded, and there are various opinions concerning the merit of the performance; but the thing chiefly worthy of observation is, that this is the only painting on cloth mentioned by ancient authors.

The paintings of the ancient artists were either moveable or on the ceilings or compartments of buildings. According to Pliny, the most eminent were those who painted moveable pictures. The latter were either on fir-wood, larch, boxwood, or canvas, as in the colossian picture mentioned above, and sometimes on marble. When they employed wood, they laid on in the first instance a white ground. Among the antiquities of the Herculaneum are four paintings on white marble.

Their immoveable paintings on walls were either in fresco or on the dry stucco in distemper. Indeed all the ancient paintings may be reduced to, first, fresco painting; secondly, water-colour or distemper-painting on a dry ground; and, thirdly, encaustic painting.

The ancient fresco-paintings appear to have been always on a white stucco-ground, the colours inlaid very deep, and the drawing much more bold and free than any similar performance of modern art. The outlines of the ancient paintings on fresco were probably done at once, as appears from the depth of the incision and the boldness and freedom of the design, equal to the care and spirit of a pencilled outline.

In general the ancients painted on a dry ground, even in their buildings, as appears from the Herculanean antiquities, most of which are

executed in this manner. At Rome and Naples, the first (deepest) coat is of true Puzzolana, of the same nature with the terras now used in mortar, required to keep out wet, about one finger thick; the next of ground marble or alabaster, and sometimes of pure lime or stucco, in thickness about one third of the former. Upon this they appear to have laid a coat of black, and then another of red paint; on which last the subject itself was executed. Such seems to have been their method of painting on walls; but in their moveable pictures, and in the performance of their first artists, and where effect of shade and light were necessary, they doubtless used white.

The colours employed they seem to have mixed up with size, of which they preferred that made by boiling the ears and genitals of bulls. This appears to have made the colours so durable and adhesive, that the ancient paintings lately found bear washing with a soft cloth and water, and sometimes even diluted aquafortis is employed to clean their paintings on fresco. Pliny says that glue dissolved in vinegar and then dried, is not again soluble.

What the encaustic painting of the ancients was, has been much disputed. From the works of Vitruvius and Pliny, it appears evidently that it was of three kinds. First, where a picture painted in the common way was covered with a varnish of wax melted, diluted with a little oil, and laid on warm with a brush. Secondly, where the colours themselves were mixed up with melted wax, and the mixture used while warm. And, thirdly, where a painting was executed on ivory by means of the cestrum or viriculum. Some experiments on this last method by Mr. Colebrook may be found in the Phil. Trans. vol. 51. and more particular directions in Muntz's Treatise on Encaustic Painting.

It appears from ancient writings of the best authority, that in the earliest and purest times of this art, the painters used few colours, perhaps not more than four. "The paintings of the ancients (says Dionysius Halicarnassensis) were simple and unvaried in their colouring, but correct in their drawing, and distinguished by their elegance. Those which succeeded, less correct in their drawing, were more finished, more varied in their light and shades, trusting their effect to the multitude of their colours." But no certain conclusion can be drawn, that the more early among the great painters of the ancients, such as Apollodorus, Zeuxis, Timanthes, &c. had no more colours than four to use, merely because they did not use them. On the contrary, it may be conjectured with some degree of probability, from their chasteness in design, and from the complaints Pliny makes of the gaudy taste of the Roman painters, that the Greeks in general were designedly chaste in their colouring, and not so merely from necessity, at least about the time of Zeuxis and Apelles; for the former could not have painted grapes so naturally as he is said to have done with four colours only: and the rebuke given by the latter to one of his scholars who had painted an Helen very gaudily, is a confirmation of these observations. "Young man (says Apelles), not being able to make her beautiful, you have made her rich."

Of white colouring substances, the ancients had white lead variously prepared, a white from calcined egg-shells, and preparations from cretaceous and argillaceous earths. The moderns in addition have magistery of bismuth, little used; and ought to have the calces of tin and zinc.

P A I N T I N G.

Of blacks, the ancients had preparations similar to lamp, ivory, blue, and Frankfort black; also to Indian ink and common writing ink; and they used, what we do not, the precipitate of the black dyers vats.

The ancients possessed a species of vermilion or fine cinnabar, a coarser cinnabar, red-lead, various earths burnt and unburnt, apparently, similar to our red ochre; Venetian red, Indian red, Spanish brown, burnt terra de Siena, and scarlet ochre; they had also a substance alike in colour and in name to our dragon's blood.

The yellow pigments of the ancients were generally the same with our ornaments, king's-yellow, Naples-yellow, &c. They did not possess turbeth-mineral, mineral-yellow, or gamboge; nor do they appear to have known of gall-stone as a pigment.

Of blue paints they had preparations from the lapis syanus and lapis armenus. Indigo they had, and perhaps bice and smelt; for they made blue glass, but whether from some ore of cobalt or of wolfram must be uncertain: they had not Prussian blue, verditer, nor litmus, which we have. We do not use the blue precipitate of the dyers vats, nor mountain blue, which they certainly employed.

Of green colours, they had verdegis, terra vert, and malashite or mountain green. The latter is not in use among us. Sap green, green verditer, and Scheele's green, appear to have been unknown to them: like us, they procured as many tints as they pleased from blues and yellow vegetables.

We have no original purple in use: that from gold by means of tin, though very good when well prepared, is too dear perhaps, and unnecessary. Their purple was a tinged earth. Their orange or sandarac (red orpiment) we also possess. Hence there does not appear to have been any great want of pigments, or any very material difference between the colours they used and such as we generally employ. Perhaps the full effect of colouring may be obtained without the use of the exceeding brilliant pigments, depending chiefly on the proportion and opposition of tints.

The ancients could not know any thing about the spirit varnishes, distillation being a modern invention; but they were undoubtedly acquainted with the use of the better oil varnishes, that is, with the use and effect of resinous gums dissolved in boiling inspissated oils.

One of the best preserved mummies in the British museum has an astonishing brightness of colours on the outside of the coffin. Thousands of years have not impaired them; they are as fresh as if they had been laid on yesterday.

The chalk ground, and the excellency of the colours, some of which imply a good deal of chemical and metallurgical knowledge, do not sufficiently account for their splendour and freshness: it must be owing to other circumstances: either to the mixture of shining colours, or to a hard glossy skin which visibly covers them all over.

From an accurate examination of one of those mummies belonging to the university of Cambridge, it appeared, that the varnish which covered the colours could not be dissolved, or in the least affected by common water; and that it equally resisted the dissolving power of the strongest spirits: hence it is reasonable to conclude, that the coffins of the mummies were not covered with size, whites of eggs, simple gums, or any preparation of wax, but with a fine transparent oil

varnish. It was discovered at the same time, that the colours themselves were not prepared or mixed with oil; for where the external glossy skin was damaged, broken, or rubbed off, even common water would wash the colours away, and affect the chalk ground under them.

Pliny has described the general and particular effects of the varnish of Apelles, under the name of atrament, so distinctly, that nobody can mistake the thing or the mixture he is speaking of. He has mentioned the shining glossy skin of the varnish which excites the brightness of the colours, and preserves them against dust; he observed, that this skin was laid on so thin, that it could not be discerned at any distance: nor was he less accurate in reporting the particular effects of that mixture which Apelles made use of; it harmonised and lowered the tone of the brightest florid colours in an imperceptible manner, and the whole appeared as if it had been seen through isinglass. The chemists and connoisseurs are fully of opinion, that no liquid substance or mixture of any kind is fit to produce these effects besides the oil varnishes: and if there are not, Apelles and the Greeks were certainly acquainted with those varnishes; a fact which might be strongly urged in behalf of their knowledge of oil colours.

The black outlines of the figures on the most ancient Greek paintings yet extant, that is, on Etruscan vases, are so sharp, so thick, and drawn in so easy and masterly a manner, that one cannot help looking upon them as having been drawn in oil colours. Had they been in distemper or water colours on the red clay ground on which they are applied, they would have been imbibed and soaked into it. Our china and enamel painters prepare and apply their colours with spike or other liquid oils; and the Greek masters seem to have done the same, unless they should appear to have burnt their vases before they painted them, or to have used a mixture of dissolved wax or gum for giving a body to their colours, which might have answered the same end as oils. And this is the more probable, as there is some reason to believe that these vases went through two different fires, that of baking them, and that of smelting or burning in their colours.

The Greek and Roman paintings that have been preserved or discovered at Rome and Herculaneum do not countenance the supposition of oil colours; at least Turnbull and the academists at Naples, who have described the royal collection at Portici, Cochin, and many other authors who have seen and described them, do not hint any thing of that nature. On the other hand, Vitruvius, who has left us so many valuable notices of the ancient arts, acquaints us, that there was a kind of painting which absolutely required a mixture of oil: and Pliny, to the same purpose, expressly says, "Sun and moon shine are inimical and obnoxious to red lead. The remedy is to apply the red wax when hot and melted with some oil on the well-dried walls, which is to be done with brushes."

From these observations, the evidence which the ancients have given us in behalf of themselves, and of their knowledge of oil painting, may be summed up in a few words.

Their having been acquainted with the white chalk ground, which many modern masters have used for oil painting on boards, proves no more than that the ancients might have done the same.

The oil varnishes used by the Egyptians and by Apelles might have brought them to the discovery of oil painting; but as it appears both

P A I N T I N G.

from mummies and from the works of Pliny, that their colours were not prepared and mixed with that varnish, and as it is plain rather that this varnish was externally laid over the finished pictures; no other conclusion can be drawn, except that they were within sight of the discovery, and that it is a matter of wonder that they should not have laid hold of it.

The outlines of the old Greek or Etruscan vases are merely fallacious appearances.

The old Greek and Roman paintings on walls and stones are either painted in distemper and fresco, or they have not been sufficiently examined.

The oil used in the coarser wax and wall paintings, proves at most that experiments had been tried with oils; but we have no direct proofs of oil painting having been understood or used by the Egyptians, Greeks, or Romans; and that, however great their skill or ingenuity, they might very well have been within sight and reach of the discovery, and nevertheless have missed it.

The art of painting was revived in Europe about the end of the 13th or beginning of the 14th century. The human mind, however, plunged in profound ignorance, was destitute of every principle of sound philosophy which might enable it to determine on the objects of the arts; and of consequence the painters contented themselves with works adapted to the general taste, without beauty and without proportion. In Italy, where the first attempts were made, they were employed in representing the mysteries of the passion, and subjects of a similar nature, on the walls of chapels and churches. Their labours were directed to a vast number of figures, rather than to the beauty and perfection of each; and the art in more modern times has always preserved somewhat of this absurd fault which it contracted at that early period. The artist in our times is not, like those in Greece, at liberty to devote his talents only to men of knowledge and discernment; he is constrained to please those who are rich, and very frequently those who are ignorant. Instead of proposing to himself the perfection of the art as the great object of his pursuit, he must rest his success and character on the facility of his operation and the abundance of his works.

Painting did not long continue in the imperfect condition in which it was left by those who first cultivated it among the moderns. It was natural that their successors should endeavour to surpass them by joining some degree of theory to the barbarous practice they had adopted. The first thing which they discovered, or rather which they revived after the manner of the ancients, was perspective. This made the artists capable of expressing what is called foreshortening, and of giving more effect and more truth to their works.

Dominique Ghirlandaio, a Florentine, was the first who enriched the style of his composition by grouping his figures, and who gave depth to his pictures, by distinguishing, by exact gradations, the spaces which his figures occupied; but his successors have far surpassed him in boldness of composition.

Leonard da Vinci, Michael Angelo, Giorgion, Titian, Bartholemew de St. Marc, and Raphael, flourished about the end of the 14th century. Leonard da Vinci was the inventor of a great many details in the art: Michael Angelo, by studying the ancients, and by his knowledge of anatomy, arrived at great elegance in drawing the outlines of his figures; Giorgion enriched the art

in general, and gave greater brilliancy to his colours than his predecessors: Titian, by a careful imitation of nature, made great proficiency in the truth and perfection of his tones: Bartholemew de St. Marc studied particularly the part of drapery, and discovered the claro-obscuro, the best manner of giving drapery to his figures, and of making the naked to be felt even where they were covered: Raphael, endowed with a superior genius, began with studying carefully all his predecessors and all his contemporaries. He united in himself all the excellencies which they possessed; and formed a style more perfect and more universal than any painter who went before or who has succeeded him. But while he excelled in every part of the art, he was chiefly superior in those of invention and of composition. It is probable that the Greeks themselves would have been filled with admiration if they had beheld his chief pieces in the Vatican, where to the greatest abundance of paintings is joined so much perfection, and purity, and ease.

After painting had arrived at the greatest perfection among the Greeks by the exertions of Zeuxis and Parrhasius, Apelles found nothing to add to the art except grace; in the same manner among the moderns, after Raphael had appeared, grace was the only thing wanting to the art, and Corregio became the Apelles of Europe. Painting was by him carried to the highest degree among the moderns; the taste of the best critics and the eye of the vulgar were equally gratified.

After these great masters a considerable interval elapsed till the time of the Caracci. Those artists, born at Bologna, by studying the works of their predecessors with great care, and particularly those of Corregio, became the first and the most celebrated of their imitators. Hannibal possessed a very correct design, and united somewhat of the ancient style to that of Lewis his brother; but he neglected to inquire into the intricate principles and philosophy of the art. The pupils of the Caracci formed a school after their manner; but Guido, a painter of an easy and happy talent, formed a style altogether graceful, and rich, and easy. Guersheem formed after Caravaggio, or invented himself a particular style of the claro-obscuro, composed of strong shades and vivid oppositions.

Peter de Cortona succeeded those great imitators of their predecessors and of nature; who finding it difficult to succeed in that kind of painting, and having besides great natural abilities, applied himself chiefly to composition or arrangement, and to what the artists call taste. He distinguished invention from composition; appeared not to have attended to the former, but chiefly to those parts which are most prominent in the picture, and to the contrasting of groups. It was then that the practice was introduced of loading pictures with a great number of figures, without examining whether or not they agreed to the subject of the history. The ancient Greeks employed a very small number of figures in their works, in order to make the perfection of those which they admitted more evident. The disciples or imitators of Cortona, on the other hand, have sought to conceal their imperfections by multiplying their figures. This school of Cortona is divided into many branches, and has changed the character of the art. The multiplication of figures, without a judicious and proper choice, carried back the art of painting to that point where the first restorers of it among the moderns had left it; while at the same time the

PAINTING.

disciples of Cortona were enabled to give to this first condition of the art a greater degree of perfection than the first artists.

About the middle of the 17th century flourished at Rome Carlo Maratti, who, aiming at the greatest perfection, carefully studied the works of the first painters, and particularly those of the school of the Caracci. Although he had already studied nature, he discovered by the works of these artists that it is not always proper to imitate her with a scrupulous exactness. This principle, which he extended to every part of the art, gave to his school a certain style of carefulness, which however is considerably degenerated.

France has also produced great masters, particularly in the part of composition; in which Poussin, after Raphael, is the best imitator of the style of the ancient Greeks. Charles le Brun and many others distinguished themselves for great fertility of genius; and as long as the French school departed not from the principles of the Italian school, it produced masters of great merit in the different branches of the art.

Mengs, from whom this account is taken, is not deceived when he declares the art of painting to have degenerated in France after Le Brun; but he seems to be mistaken in giving the imitation of the works of Rubens found at Paris as the cause of this decay. It appears from this opinion, that the recent French school was not well known to him. The French, indeed, if we may believe their own authors, were never much occupied in the imitation of Rubens; and they have for a long time despised him. But the perfection of the dramatic art in France, the dress of their actors, the magnificence and manners of the court, have contributed very much to the decay of painting. Instead of forming their taste on the beautiful simplicity of nature, their painters studied the gestures and the attitudes of comedians, the fopperies of women of fashion, the affected airs of courtiers, the pageantry of Versailles, and the magnificence of the opera. Mengs says, "that the French have formed a national style, of which ingenuity and what they call *esprit* are the discriminating qualities; that they have ceased to introduce Greek, Egyptian, Roman, or barbarian personages into their paintings; and that, after the example of Poussin, they content themselves with figures altogether French, as if it were their intention to hand down to posterity that such a nation once existed."

Since, according to the confession of Mengs, their figures are altogether French, there is no reason to believe that the French painters have imitated Rubens, whose works are marked much more strongly than those of his master Æneus with the Flemish character. The truth is, that their painters, like Cortona and Maratti, have crowded their pictures with a great number of figures; have grouped them in a manner most calculated to strike the senses; have been more intent on agreeable artifices than expression and beauty; and, finally, that they have borrowed the manners of the court and theatre.

The first masters of the great schools of painting, with the ancients and nature for their guides, and their genius for their support, carried every part of the art to the greatest height of perfection. Those who followed them, and who had the example of their predecessors in addition to the first sources of truth and beauty, did by no means arrive at the same excellence. The Caraccis in their school, Paul Veronese, and all the painters of

his time, Vandyke, and all those who exercised the art in Italy, in Flanders, and in France, supported it with great brilliancy. But soon after the number of artists was multiplied; and slavishly copying men of inferior talents, they produced works of an inferior nature. Some wanting to be colourists, their pieces were exaggerated; others affecting simplicity, became cold and insipid. At this period of the art, men of real abilities, and covetous of fame, who wished to rise superior to the mediocrity of the times, seem not to have taken the road of truth and nature. They affected a style of pompous preparation, and annexed a kind of merit to the expert management of the pencil. The affected forms of Cortona and of his pupils, the fantastical attitudes and the poignant effects of Piazzetta, and in short the ingenious contrivances of the last masters of the French school, are decided proofs of this increasing bad taste.

It appears, that for some time past greater pains have been taken to form men for the art than to encourage those who possess the talent. In consequence of this ruinous practice, schools for drawing, very different from those formed by able painters, have been exceedingly multiplied; and these give the elements according to an uniform system, by which the mind is laid under a regular restraint at the very threshold of the profession. This evil is productive of two inconveniences; it gives middling painters, and it multiplies them to that degree, as to hasten the downfall and bring into contempt the art itself.

The particular reputation of the Italian painters furnishes another reason for the decline of the art. The first painters of that country were few in number; they were honoured, and they deserved to be honoured. Their distinguished reputation has conferred a value on the general paintings of their countrymen. The desire of possessing taste, or of being thought to possess it, has led the rich and the ignorant of all nations to give a preference to the Italian market. Necessity, in this case, would multiply the painters; and their abilities must bear a pretty exact proportion to the discrimination of those who give the price.

The decline of painting has also arisen from the despotism which for some time reigned in the academic societies. In fact, these have often been ruled by men who would force every exertion of genius into their peculiar tract of operation. If they required such or such merit of execution, the first principles of the art were neglected for that peculiar excellency. In this manner the schools were absolute in behalf of design as long as statuary was held in chief estimation. The artist, whose abilities and inclination led him to colouring, was obliged to abandon a pursuit which could be of no service to him, and devote himself to that for which he was not qualified by nature. On the other hand, if the instructions of the schools be confined to colouring, a mind disposed to the choice and exactness of forms will find no encouragement, and be for ever lost to the art. In this manner the ignorance of those who wish to be connoisseurs, and the narrow views of those who pretend to direct the general taste, have equally contributed to the decline of the arts.

SECT. II. Of the Schools.

A school, in the fine arts, denominates a class of artists who have learned their art from a certain master, either by receiving his instructions, or by studying his works; and who of consequence dis-

PAINTING.

cover more or less of his manner, from the desire of imitation, or from the habit of adopting his principles.

All the painters which Europe has produced since the renovation of the arts are classed under the following schools: the school of Florence, the school of Rome, the school of Venice, the Lombard school, the French school, the German school, the Flemish school, the Dutch school, and the English school.

The Florence school is remarkable for greatness; for attitudes seemingly in motion; for dark severity; for an expression of strength, by which grace perhaps is excluded; and for a character of design approaching to the gigantic. The productions of this school may be considered as overcharged; but it cannot be denied that they possess an ideal majesty, which elevates human nature above mortality. The Tuscan artists, satisfied with commanding the admiration, seem to have considered the art of pleasing beneath their notice.

This school has an indisputable title to the veneration of all the lovers of the arts, as the first in Italy which cultivated them.

Painting, which had languished from the destruction of the Roman empire, was revived by Cimabue, born of a noble family in Florence in the year 1240. This painter translated the poor remains of the art from a Greek artist or two into his own country. His works, as may easily be imagined, were in a very ordinary style, but they received the applause and admiration of his fellow citizens; and if Cimabue had not found admirers, Florence in all probability would not have been honoured with Michael Angelo. The number of painters became soon so considerable in Florence, that in the year 1305 they established a society under the protection of St. Luke.

Massolino, towards the beginning of the 15th century, gave more grandeur to his figures, adjusted their dress better, and shed over them a kind of life and expression. He was surpassed by Massacio his pupil; who first gave force, animation, and relief to his works.

Andrew Castagna was the first Florentine who painted in oil. But Leonardo da Vinci and Michael Angelo, contemporary painters, were the glory of the school of Florence. Michael Angelo was superior to Leonardo in grandeur, in boldness of conception, and in knowledge of design; but Leonardo was superior to him in all the amiable parts of the art. Leonardo, possessed of a fine imagination, and full of sensibility, devoted himself in painting to express the affections of the soul; and if, in this sublime branch of the art, he was afterwards surpassed by Raphael, he had at least the glory not only of exceeding all the painters who went before him, but of pursuing a path which none of them had attempted. His design was pure and neat, and not wholly destitute of greatness. He never went beyond nature, and he made a good choice of objects for imitation.

Michael Angelo, less formed to experience sweet affections than vehement passions, sought in nature what the strength of man might accomplish, not that which constitutes beauty. He delighted in being great and terrible, more than in graceful and pleasant attitudes. Well acquainted with anatomy, he knew more exactly than any other artist in what manner to express the joining of the bones of the body, and the office and insertion of the muscles; but too eager to display his knowledge of anatomy, he seems to have forgotten that the muscles are

softened by the skin which covers them; and that they are less visible in children, in women, and in young men, than in confirmed and vigorous manhood. "In his figures (says Mengs) the articulations of the muscles are so easy and free, that they appear to be made for the attitude in which he represents them. The fleshy parts are too much rounded, and the muscles are in general too large and of too equal strength. You never perceive in his figures a muscle at rest; and although he knew admirably well how to place them, their action is very frequently inconsistent with their situation."

"He did not possess (says sir Joshua Reynolds) so many delightful parts of the art as Raphael; but those which he had acquired were of a more sublime nature. He saw in painting little more than what might be attained in sculpture; and he confined it to exactness of form and the expression of passions."

He informs us, in one of his letters, that he modelled in earth or wax all the figures which he intended to paint. This method was familiar to the great painters of his time, and ought never to be abandoned. It appears, that in representing them in this manner in relief, the painter can imitate them much more exactly than when they are drawn with a crayon or pencil on a plain surface.

"Michael Angelo (continues sir Joshua Reynolds) never attempted the lesser elegancies and graces in the art. Vasari says, he never painted but one picture in oil; and resolved never to paint another, saying it was an employment only fit for women and children.

"If any man had a right to look down upon the lower accomplishments as beneath his attention, it was certainly Michael Angelo; nor can it be thought strange, that such a mind should have slighted, or have been withheld from paying, due attention to all those graces and embellishments of art which have diffused such lustre over the works of other painters."

Ancient Rome, rich with the works brought from Greece, or finished in its own bosom by Grecian artists, handed down in its ruins the remains of that glory to which it had been elevated. It was by the study of these remains that the modern artists were formed: they derived from them the knowledge of design, the beauty of exquisite forms, greatness of style, and justness of expression, carried to that length only which did not affect the beauty of the figure. From them also they derived the principles of the art of drapery; and they followed these principles even while they made the drapery of modern paintings more large and flowing than what was practised by the ancient sculptors. The Roman school was altogether devoted to the principal parts of the art, to those which require genius and vast conceptions; and was no farther occupied with colours than what was necessary to establish a difference between painting and sculpture, or rather between painting varied with colours and in clara-obscura.

Raphael Sanzio, born at Urbino in 1483, and scholar to Pietro Perugino, was the undoubted founder of this school. His first manner was that of Perugino his master; but he travelled twice to Florence to study the great artists who flourished in that city.

It was fortunate for Raphael, says Mengs, that he was born in what he terms the infancy of the art, and that he formed himself by copying nature

PAINTING.

before he had access to see the works of any great master. He began by studying, with great exactness, the simple truth in his figures. He was then ignorant that any choice was necessary; but he saw the works of Leonardo da Vinci, of Massacio, and of Michael Angelo, which gave his genius a new direction. After this he perceived that there was something more in the art of painting than a simple imitation of truth. But the works of those masters were not sufficiently perfect to point out the best choice to make; and he continued in uncertainty till he saw at Rome the works of the ancients. Then he perceived that he had found the true models which he wanted; and in imitating them he had only to follow the natural impulse of his genius.

Habituated by his first manner to imitate nature with precision, it was not difficult to carry the same exactness into the imitation of the ancients; and it was a great advantage to him that he flourished in an age wherein the artists were not arrived at facility of execution at the expence of rigorous exactness. He never lost sight of nature; but he was instructed by the ancients in what manner she should be studied. He perceived, that the Greeks had not entered into minute details, that they had selected what was great or beautiful, and that one of the chief causes of the beauty of their works was the regularity of their proportions: he began, therefore, by carefully studying this part of the art. He saw also that the joinings of the bones, and the free play of their articulations, are the causes of all graceful movement: he therefore, after the example of the ancients, gave the greatest attention to this part, and was led by these observations not to be contented with the simple imitation of nature.

His design is excellent, but neither so perfect nor so finished as that of the Greeks. He excelled in representing the character of philosophers, apostles, and other figures of that kind; but he did not equal the Greeks in ideal figures, which ought to carry the impression of divinity. His taste for design was more Roman than Greek, because he formed it chiefly on the basso-relievos which he found at Rome. On this account he had the habit of marking strongly the bones and the articulations, and labouring the fleshy parts less; but as these basso-relievos are very exact with regard to the reciprocal proportions of every member, he excelled in this part, while at the same time he did not give to his figures all the elegance of the Greek artists, nor the flexibility of articulation which is admired in the Laocoon, in the Apollo of Belvidere, and in the Gladiator.

The manners and spirit of his age, and the subjects which he most commonly treated, prevented him from reaching the ideal of the ancients. Having seldom occasion to represent figures altogether ideal, he devoted himself to purity of expression. He knew that the expression of the passions of the soul is absolutely necessary in an art which represents the actions of men, since from those affections the actions may be said truly to originate. To make figures act, and yet neglect the interior springs of action, is nothing more than a representation of automata. The attitudes and action are evident; but they appear not to act of themselves, because they are void of those principles from which alone men are supposed to act. An artist who neglects expression, gives no just representation of character, even though he should take nature for his model.

Raphael's first care, when he wanted to com-

pose a piece, was to weigh the expression; that is to say, to establish, according to the nature of the subject, the passions which were to animate the characters. All the figures, all the accessories, all the parts of the composition, were moulded to the general expression.

As he had not found examples in the ancient statues of the *claro-obscuro*, he was comparatively weak in this part; and if there was any thing remarkable in his distribution of light and shade, he owed it to the works of the Florentine painters. It cannot be said, however, even with regard to the *claro-obscuro*, that he imitated nature without taste. He delighted in what are called masses of light; and disposed the great lights in the most conspicuous places of his figures, whether naked or in drapery. If this method did not produce effects highly illusive, it gives his works that distinctness which makes his figures conspicuous at a distance; and this must be allowed to be an essential part of the art of painting. He did not proceed beyond this; and content with that kind of *claro-obscuro* which comprehends imitation, he never attempted that which is ideal.

The composition and the ensemble of his figures were the chief excellences of Raphael. His philosophical mind could not be affected with objects which had not expression. He had too high an idea of painting to consider it as a mute art; he made it speak to the heart and soul; and he could only do this in subjects which required expression. If Raphael did not reach the Greek excellence, if he did not possess the art of embellishing nature in the same high degree, he saw at least, and imitated her in whatever was expressive and beautiful. "The Greeks sailed with majesty," says Mengs, "between earth and heaven: Raphael walked with propriety on the earth."

"Composition is in general," says the same author, "of two kinds: Raphael's is the expressive kind; the other is the theatrical or picturesque, which consists of an agreeable disposition of the figures. Lanfranc was the inventor of this last, and after him Pietro de Cortona. I give the preference to Raphael; because reason presides over all his works, or at least the greatest part of them. He never allowed himself in common ideas, and was never allured to give any thing in his accessory figures, which might turn the attention from the principal object of the piece."

A history of the schools is nothing more than a history of the painters who founded them. In those two which we have already given, Michael Angelo and Raphael come readily forward to claim our attention; and therefore we cannot do better than conclude the account by the masterly contrast of these eminent painters given by sir Joshua Reynolds. "If we put those great artists," says he, "in a light of comparison with each other, Raphael had more taste and fancy, Michael Angelo more genius and imagination. The one excelled in beauty, the other in energy. Michael Angelo has more of the poetical in operation; his ideas are vast and sublime; his people are a superior order of beings; there is nothing about them, nothing in the air of their actions, or their attitudes, or the style and cast of their limbs or features, that puts one in mind of their belonging to our species. Raphael's imagination is not so elevated; his figures are not so much disjointed from our own diminutive race of beings, though his ideas are chaste, noble, and of great conformity to their subjects. Michael Angelo's works have a strong, peculiar, and mark-

P A I N T I N G.

ad character; they seem to proceed from his own mind entirely; and that mind so rich and abundant, that he never needed, or seemed to disdain, to look abroad for foreign help. Raphael's materials are generally borrowed, though the noble structure is his own. The excellency of this extraordinary man lay in the propriety, beauty, and majesty of his characters; his judicious contrivance of composition, correctness of drawing, purity of taste, and the skilful accommodation of other men's conceptions to his own purpose."

This school is the child of nature. The Venetian painters, not having under their eyes like the Roman the remains of an antiquity, were destitute of the means of forming a just idea of the beauty of forms and of expression. They copied without choice the forms of nature; but they were chiefly delighted with the beauties which presented themselves in the mixture and the variety of natural colours. Their attention not being detached from this part by any thing of greater importance, colouring was their chief object, and they succeeded in it. They did not rest contented with characterizing the objects by comparison, in making the colour proper for one of more value by the colour more proper for another; but they endeavoured still farther, by the agreement and opposition of the coloured objects, and by the contrast of light and shade, to produce a vigorous effect, to demand and fix the attention. Dominic, who was said to have perished at Florence by the jealousy of Andre Castagna, and who was the second Italian artist who painted in oil, had educated, before he quitted Venice, his native country, Jacques Bellin, who was remarkable for nothing but the picturesque education which he gave to Gentel and John his two sons.

Gentel, who was the eldest, painted chiefly in water colours. John contributed much to the progress of his art in painting constantly in oil, and after nature. Although he always retained great stiffness in his manner, he had less than his father or brother. Great neatness of colouring, and an approach to harmony, are evident in his works. His taste in design is Gothic, the air of his heads is sufficiently noble, his attitudes are without judgment, and his figures without expression. He had for scholars Giorgion and Titian, who deserve to be considered as the founders of the Venetian school.

Giorgion distinguished himself by a design of a better taste than that of his master: but he chiefly surpassed him in colouring. He died in his 32d year; and excited the emulation of Titian, who soon greatly excelled him.

Tiziano Vecelli, known best by the name of Titian, was instructed to copy nature in the most servile manner in the school of John Bellin; but when he had seen the works of Giorgion, he began to study the ideal in colouring.

The truth of history is not to be expected in his historical paintings, or in those of the artists of the same school. He seems to have paid little attention to the consistence of scene, to the costume, to expression adapted to the subject, or finally, to the accommodation of parts which characterise the works of those who have studied the ancients. He was in short a great painter, and nothing more.

But although he deserves not to be placed among the most distinguished artists in point of judgment, yet he is by no means destitute of great and noble conceptions. There is often to be found among his male figures a considerable degree of

grandeur: but if he has sometimes, like Michael Angelo, overcharged his design, it was more discovered in the swelling of the soft and fleshy parts, than in vigour and muscular strength.

Almost entirely devoted to simple imitation, he had scarcely greater choice in the *claro-obscuro* than in design. He cannot be justly reproached at the same time for weakness in this particular; because in endeavouring to imitate the colours of nature, he was obliged to observe the degrees of light. And in proportion as he succeeded in the imitation of natural colours, he must be less defective in the *claro-obscuro*: but it is not in the knowledge of this part of the art that we are to seek for the beauties of his works. These are to be found in the happy dispositions of colours both proper and local, and he carries this to the highest point of perfection.

The artists in the Florentine and Roman schools painted most commonly in water colours or in fresco; and in the exercise of their profession, instead of nature, they finished their works from their first sketches. Titian painted in oil, and finished from the objects in nature; and this practice, joined to his exquisite talents, gave the greatest truth to his colours. His being a portrait painter was also of advantage to him as a colourist. In this department he was accustomed to the colours of nature in carnations and draperies. He was a landscape-painter; and here also he took the colours from nature.

"As Titian perceived," says Mengs, "that the objects which are beautiful in nature have often a bad effect in painting, he found it necessary to make a choice in the objects of imitation; and he observed, that these were objects of which the local colours were extremely beautiful, which nevertheless were in a great measure destroyed by the reflection of light, by the porosity of the body, and by different luminous tints, &c. He perceived also, that in every object there was an infinite number of half tints, which conducted to the knowledge of harmony. In short, he observed in the objects of nature a particular agreement of transparency, of opacity, of rudeness, and of polish, and that all objects differed in the degrees of their tints and their shades. It was in this diversity he sought the perfection of his art; and in the execution he moderated the effect of natural colours. For example, in a carnation which had many demi-tints, he confined himself to one; and he employed even less than a demi-tint, where there were few in the natural object. By these means he obtained a colouring exquisitely fine; and in this part he was a great master, and deserves to be carefully studied."

Titian has in general little expression in his pictures, and he sometimes introduces figures which augment the coldness of the piece; for if it be true that the heads, even in historical painting, ought to be studied after nature, it is true also that an individual nature ought not to be presented, but one general and ideal. It is necessary that they should be men, while they resemble not men we are accustomed to see. The painter fails in the effect which he ought to produce, if, when he represents Achilles, Hector, and Cæsar, his personages are familiar to our observation.

The colours of his paintings are so mingled together, as to give no idea of the colours on his pallet; which distinguishes him from Rubens, who placed his colours one at the side of another. It is impossible to say, on the narrowest inspection, with what colours he produced his tints. This

P A I N T I N G .

practice, which enabled him to imitate so exactly the colours of nature, gives a marked distinction to his manner of painting. In the examination of his works, the critics lose an ordinary source of pleasure which arises from marking the freedom of hand; but they may console themselves with the natural and exquisite touches of this artist.

He is of historical painters one of those who have succeeded in landscape. His situations are well chosen; his trees are varied in their forms, and their foliage well conceived. He had a custom of representing some remarkable appearance in his landscapes to render them more striking.

The distinguishing characteristics of this school are, grace, an agreeable taste for design, without great correction, and mellowness of pencil, and a beautiful mixture of colours.

Antonio Allegri, called Corregio, was the father and greatest ornament of this school. He began like the painters of his time to imitate nature alone; but, as he was chiefly delighted with the graceful, he was careful to purify his design from all short turnings and unnecessary angles. He perceived that largeness contributed to grace; and therefore he not only rejected all small figures, but enlarged as much as possible the outlines, avoided acute angles and straight lines, and by these means gave an easy grandeur to his design. He made his figures elegant and large; he varied the outlines by frequent undulations; but he was not always pure and correct.

Corregio painted in oil, a kind of painting susceptible of the greatest delicacy and sweetness; and as his character led him to cultivate the agreeable, he gave a pleasing captivating tone to all his pictures. He sought transparent colours to represent shades conformable to nature, and adopted a manner of glazing which actually rendered his shadows more obscure. Obscurity in painting cannot be fully obtained without transparent colours; for these absorb the rays of light, and of consequence give less reflection. He laid his colours very thick on the brightest parts of his pictures, to make them capable of receiving, by a proper touch, the greatest degree of light. He perceived, that the reflections of light correspond with the colour of the body from which they are reflected; and on these principles he founded his theory of colours with respect to light and shade and reflection. But it is chiefly in the colour of his shades that he deserves to be imitated; for his lights are too clear, and somewhat heavy; and his fleshy parts are not sufficiently transparent.

Harmony and grace are connected together; and on this account Corregio excelled also in harmony. As the delicacy of his taste suffered him not to employ strong oppositions, he naturally became a great master in this part, which chiefly consists of easy gradations from one extreme to another. He was harmonious in his design, by making the lines which formed the angles of the contour arched and undulated. Both in the lights and shades, he placed always between the two extremes a space which served to unite them, and to form a passage from the one to the other. The delicacy of his organs made him perceive, better than any other artist, what relief was necessary to the eye after a violent exertion; and he was therefore careful to follow a bold and prevailing colour with a demi-tint, and to conduct the eye of the spectator, by an invisible gradation, to its ordinary state of tension. In the same manner (says Mengs) does agreeable and melting music pull one so gently out of sleep, that the awaking

resembles enchantment more than the disturbing of repose. A delicate taste in colours, a perfect knowledge of the *claro-obscuro*, the art of uniting light to light, and shade to shade, together with that of detaching the objects from the ground, inimitable, grave, and perfect harmony, were the qualities which distinguished Corregio from all the painters, and placed him near the head of his profession.

The Carracci, Lewis, Augustin, and Hannibal, formed what is called the second Lombard school, which is frequently distinguished by the name of the school of Bologna.

Lewis was the master of the other two: he had studied the works of Titian and Paul Veronese at Venice, those of Andre del Sarte at Florence, those of Corregio at Parma, and those of Jules Roman at Mantua; but he chiefly endeavoured to imitate the manner of Corregio. Hannibal fluctuated between Corregio and Titian. Augustin their rival in painting had his mind cultivated by learning, and devoted part of his time to poetry and music, to dancing and to other many exercises. These three painters often employed their talents on the same piece; and it was admirable that their united labours seemed to be animated with the same spirit.

They established an academy at Bologna, which their zeal for the advancement of their art made them call *l'Accademia degli Desiderosi*; but it was afterwards called the Academy of the Carracci, because the reputation which these artists acquired permitted not a more illustrious name to be given to an establishment of which they were the founders. In this school were taught the art of constructing models, perspective, and anatomy; lessons were given on the beautiful proportions of nature, on the best manner of using colours, and on the principles of light and shade. They held frequent conferences, in which not only artists, but men of general knowledge, were permitted to elucidate points relative to the art of painting; but they were separated upon Hannibal's going to Rome to adorn the gallery of the cardinal Farnese.

The works of the Carracci are often, from the resemblance of their manner, confounded together; especially those which were finished previous to the residence of Hannibal at Rome. Meanwhile each of them has a decided character distinct from the other two. Lewis had less fire, but more of gracefulness and grandeur: Augustin had more spirit in his conception, and more pleasantness in his execution: Hannibal is characterized by boldness, by a design more profound, by an expression more lucky, and by an execution more solid.

Sir Joshua Reynolds, who saw the works of Lewis at Bologna, holds him out in his discourses as the best model for what is called style in painting; which is the faculty of disposing colours in such a manner as to express our sentiments and ideas. "Lodovico Carracci," says he, "I mean in his best works" appears to me to approach the nearest to perfection. His unaffected breadth of light and shadow, the simplicity of colouring, which, holding its proper rank, does not draw aside the least part of the attention from the subject, and the solemn effect of that twilight which seems diffused over his pictures, appears to me to correspond with grave and dignified subjects better than the more artificial brilliancy of sunshine which enlightens the pictures of Titian."

Hannibal is esteemed by the best judges as a

PAINTING.

model for beauty and design. Those who blame him for becoming less a colourist at Rome than he was at Bologna, ought to recollect that it is his performances at Rome which have chiefly secured his reputation. Severe critics have maintained that his design is too little varied in his figures; that he excels only in male beauty; that in imitating ancient statues, he excites some resemblance, but without arriving at the sublimity of ideas and of style which characterize the ancients; or, in other words, that he hath successfully imitated the exterior of their manner, but that he was incapable of reaching the interior and profound reasonings which determined those admirable artists.

The success of Hannibal, and the reputation which he acquired, have been pernicious to the art. His successors, deluded by these considerations, have made him the object of their imitation, without ascending to the sources from which he derived his knowledge, and which he never could equal. The result has been, that, instead of becoming equal to Hannibal, they have often copied his imperfections.

This school has been so different under different masters, that it is difficult to characterize it. Some of its artists have been formed on the Florentine and Lombard manner, others on the Roman, others on the Venetian, and a few of them have distinguished themselves by a manner which may be called their own. In speaking in general terms of this school, it appears to have no peculiar character; and it can only be distinguished by its aptitude to imitate easily any impression; and it may be added, speaking still in general terms, that it unites, in a moderate degree, the different parts of the art, without excelling in any one of them.

It is equally difficult to determine the progress of painting in France. Miniature painting, and painting on glass, were early cultivated in that country; and in these two kinds, the Italians had often recourse to the French artists. When Francis I. encouraged Rosso, a Florentine, and Primaticci, a Bolognian, the painters in France were not remarkable for any superior talent; but they were capable of working under these foreign artists.

Cousin, a painter on glass, and portrait-painter, was the first who established any kind of reputation in France. He was correct, but possessed very little elegance of design.

Painting, for some time encouraged by Francis I. fell into a state of languor, from which it was not recovered till the reign of Louis XIII. Jacques Blanchard, formed at the Venetian school, and called the French Titian, flourished about this period. But as he died young, and without educating any pupils to perpetuate his manner, he must be regarded as a single good artist, and not as a founder of the French school.

In the same manner Poussin, one of the greatest French painters, and whom they call the Raphael of France, educated no pupils, nor formed any school. His style and character of painting are described by sir Joshua Reynolds as simple, careful, pure, and correct. No works of any modern (adds the same author) have so much of the air of antique painting as those of Poussin. His best performances have a remarkable dryness of manner, which, though by no means to be recommended for imitation, yet seems perfectly correspondent to that ancient simplicity which distinguishes his style.

In the latter part of his life he changed from this manner to one much softer and richer; where there is a greater union between the figures and the ground. His favourite subjects were ancient fables; and no painter was ever better qualified to paint such subjects, not only from his being eminently skilled in the knowledge of the ceremonies, customs, and habits of the ancients, but from his being so well acquainted with the different characters which those who invented them gave their allegorical figures.

If Poussin, in the imitation of the ancients, represents Apollo driving his chariot out of the sea by way of representing the sun rising, if he personifies lakes and rivers, it is no way offensive in him, but seems perfectly of a piece with the general air of the picture. On the contrary, if the figures which people his pictures had a modern air or countenance, if they appeared like our countrymen, if the draperies were like cloth or silk of our manufacture, if the landscape had the appearance of a modern view, how ridiculous would Apollo appear? instead of the sun, an old man; or a nymph with an urn, instead of a river or a lake.

Poussin, however, more admired than imitated, had no manner of influence in forming the French school. Simon Vouet, his enemy and persecutor, had this honour, because his pupils, in the happy age of the arts in France, conferred on it the greatest splendor. Vouet was a man of distinguished abilities; but the school which he erected would have had no continuance if his scholars had pursued his manner of painting. He had a kind of grandeur and facility; but his design was false with regard to colours, and without any idea of expression. It was said of him, that he only needed to take the pencil in his hand to finish with one stroke the subject which he had conceived; and on this account one is tempted to be pleased, because he is astonished. He had the merit of destroying the insipid manner which reigned in France, and of pointing the way to a better taste.

If Vouet laid the foundation of the French school, Le Brun finished the edifice. When Le Brun was placed under the tuition of Vouet, he astonished his master and the rest of his pupils with the rapidity of his progress. At the age of twenty-six he finished his piece called the horses of Diomedes, which gained a place in the palace royal, beside those of the most eminent painters. He was afterwards recommended to Poussin; but the young artist was more disposed by his natural inclinations to that modern part of the art which is called the great machine, than to the profound and studied manner of the Greek artists. Poussin, at the same time, was of great service to him, in recommending to his study the monuments, the customs, the dress of the ancients; their architecture, their rites, their spectacles, their exercises, their combats, and their triumphs.

Le Brun had a noble conception and a fruitful imagination. He was on no occasion inferior to the vast compositions which he undertook, and he chiefly excelled in rigorous costume and exact likenesses.

Few painters have united so great a number of essential qualities and accessories of the art; and if he had superiors, it consisted in this, that they possessed some particular quality in a more eminent degree.—He was a good drawer, but his design was far from being so elegant as that of Raphael, or so pure as that of Domenique, and it was less lively than that of Hannibal Carracci,

P A I N T I N G.

whom he had taken for a model. In drapery he followed the Roman school: the clothes which he gave to his figures were not like those of the Venetian school, of such and such a stuff; they were draperies and nothing more, and this manner agreed with the heroic style of his works; but in this part he was not equal to the painter of Urbino. He had studied the expression of the affections of the soul, as is evident from his treatise on the character of the passions: but after observing the general characters, and establishing the principal strokes of expression, he thought he reached the whole extent of this subject, which is so infinitely extended. He always employed the few characters which he had once found out, and neglected to study the prodigious variety of gradations by which the interior affections are manifested in the exterior appearance. He fell then into the manner of repeating always; and possessed neither the delicacy, nor the depth, nor the extreme justness, of Raphael's expression. He loved and possessed in a high degree the grand machine of the art; he was delighted with great compositions; and he gave them life, and animation, and variety; but he wanted the vigour and inspiration of Raphael. His compositions are formed on philosophical principles, but those of Raphael are created. Le Brun thought well; Raphael, Poussin, le Sueur, thought most profoundly.—Le Brun had elevation, but he was not elevated like Raphael, to the sublime.

In colouring, Le Brun did not imitate the painters of the Venetian school. The sweet attractions and strong and solid colours of the schools of Rome and Lombardy seem rather to have been the object of his imitation; and from them also he learned an easy, agreeable, and bold management of the pencil.

As Le Brun possessed a great share of lively imagination, he delighted in allegory, which gives the greatest scope for ingenious invention. The fecundity and resources of his imagination appeared still farther, in his inventing symbols for his allegorical figures without resting contented with those employed by the ancients. But fanciful representations of this kind are distant from the operations of true genius. Spirit and thought in the arts are very different from spirit and thought in literary productions. A painter of moderate abilities may introduce into his works a great deal of the invention which belongs to poetry without enriching his peculiar art. The true spirit of painting consists in making the figures appear in the very circumstances and attitudes in which they are supposed to act, and penetrated with the sentiments with which they ought to be affected. By these means the spectator is more certainly interested than if the actions and thoughts were represented by allegorical symbols. Poussin appears to have less waste of spirit and imagination than Le Brun, while at the same time he gives more delight to people of spirit and imagination.

Eustach le Sueur was the contemporary and rival of Le Brun; and no painter approached nearer to Raphael in the art of drapery, and in disposing the folds in the most artful and the noblest manner. His design was in general more slender than that of Raphael, but, like his, it was formed on the model of the ancients. Like Raphael, he represented with art and precision the affections of the soul; like him, he varied the hair of the head, according to the condition, the age, and the character of his personages; and, like him, he made the different parts of every figure contribute to the general effect. His intention in composing was to

express his subject, not to make shining contrasts or beautiful groups of figures, not to astonish and bewitch the spectator by the deceitful pomp of a theatrical scene, or the splendor of the great machine. His tones are delicate, his tints harmonious, and his colours, though not so attractive as those of the schools of Venice and Flanders, are yet engaging. They steal peaceably on the soul, and fix it without distraction on the parts of the art, superior to that of colouring.

His preaching of St. Paul, and the picture which he painted at St. Gervais, which the critics compare with the best productions of the Roman school, and the 22 pictures which he painted for the Carthusian monastery at Paris, and which were lately in possession of the king, are esteemed his best pieces. His contemporaries affirm, that he considered as sketches merely those excellent performances which are the glory of the French school.

If Le Sueur had lived longer, or if, like Le Brun, he had been employed under a court, fond of the arts and of learning, to execute the great works of the age, the French school would have adopted a different and a better manner. The noble beauty of his heads, the simple majesty of his draperies, the lightness of his design, the propriety of his expression and attitudes, and the simplicity of his general disposition, would have formed the character of this school. The deceitful pomp of theatrical decoration would have been more lately introduced, or perhaps would never have appeared, and Paris might have been the counterpart to Rome. But as Le Brun, by an accidental concurrence of favourable circumstances, was the fashionable painter, to be employed or rewarded it was necessary to imitate his manner; and as his imitators possessed not his genius, his faults became not only current but more deformed.

The French school not long ago changed its principles; and if, when peace shall be restored to that nation, they continue to follow the road which, while the arts flourished among them, they marked out for themselves, they have the chance of becoming the most rigid observers of the laws imposed on the Greek artists. The count de Ceyles, pupil of Bouchardon, who by his rank and fortune had the means of encouraging the imitators of the ancients, and of the masters of the 15th century, first formed the design of restoring a pure taste to the art of painting. He was seconded by the talents of M. Vien, an artist who had only occasion to have his lessons and his example laid before him. In this manner commenced a revolution, so much the more wonderful, as it was scarcely ever known that any nation substituted a system of simple and rigid excellence in place of a false and glittering taste. The history of all nations, on the contrary, discovers a gradual progress from a rude beginning to perfection, and afterwards to irremediable decay. The French had the prospect of stopping short in this ordinary course. They began in a manner which promised success; and the best consequences may be expected, if the internal commotions of France do not destroy the taste for the arts in that country.

In Germany there can hardly be said to be a school, as it is a continuation of single artists, who derived their manner from different sources of originality and imitation. There were some German painters of eminence, when the art, emerging from its barbarous state, first began to be cultivated with success in Europe. As they were totally unacquainted with the ancients, and had scarcely access to the works of their contemporaries in Italy, they

PAINTING.

copied nature alone, with the exception of somewhat of that stiffness which forms the Gothic manner. It is in this manner, if we speak of the early German painters, which characterizes their school. But this is by no means the case with their successors, part of whom were educated in Flanders and part in Italy: for if Mengs or Dietrich were comprehended in this school, there would be nothing peculiar to its manner discovered in their works. And it is therefore necessary to confine our observations to the more ancient German painters, in whom the Gothic style is conspicuous.

Albert Durer was the first German who corrected the bad taste of his countrymen. He excelled in engraving as well as painting. His genius was fertile, his compositions varied, his thoughts ingenious, and his colours brilliant. His works, though numerous, were finished with great exactness; but as he owed every thing to his genius, and as works of inferior merit were by the false taste of the times preferred to his, it was impossible for him altogether to avoid the faults of his predecessors. He is blamed for stiffness and aridity in his outlines, for little taste or grandeur in his expression, for ignorance of the costume, of aerial perspective, and of gradation of colours; but he had carefully studied lineal perspective, architecture, and fortification.

John Holbein or Holbein, nearly contemporary with Albert Durer, painted in oil and water colours. He excelled chiefly in history and in portrait painting. His colours are fresh and brilliant, and his works are highly finished; but in his historical subjects, his draperies are not in so good a taste as those of Albert Durer.

The Flemish school is recommended to the lovers of the art by the discovery, or at least the first practice of oil painting. Van Mander gives us the account of this wonderful discovery in the following words: "John Van Eyck was so excellent a chemist, that he discovered a method of varnishing his distemper colours with a varnish, which was made of some oils, and was very pleasing on account of the gloss and lustre it gave them. Many artists in Italy had vainly attempted to find out that secret; they never hit on the true method. It happened once that John, in his usual manner, having highly finished one of his pictures on boards, and having varnished it with his new invented varnish, exposed it to dry in the sun; but whether the boards were not well joined, or whether the heat of the sun was too violent, the boards split asunder and opened in the junctures. John saw with concern that his work was spoiled, and resolved to contrive something against future accidents of the same kind. Being disgusted at distemper painting and varnishing, he thought of a varnish that might dry without sunshine; and having tried many oils and substances, he found that linseed and nut oil dried better than any other. He boiled them with some other drugs, and produced far the best varnish then known. Ever bent on improvement, he found, after much enquiry, that colours mixed with these oils worked and dried extremely well, and when dried would be waterproof. He observed likewise, that these oils would animate and give them a gloss and lustre without any farther varnishing." The truth, however, of this account is now very much questioned; and it is even proved by the manuscripts of Theophilus Presbyter, and also by some old oil paintings in England, that this method of painting was discovered long before the time of John Van Eyck. At the same time we admit, that John and his brother

Hubert may have been the first who brought off painting into general practice, not only by showing the excellence of which it was susceptible, but also by making several improvements on the art. And this is the more probable, from the great reputation which their pictures acquired over all Europe, by the softness and delicacy of their colours. The attention of the Italian painters was chiefly excited, inasmuch that Antoine de Messina performed a journey into Flanders for the express purpose of acquiring the confidence of John Van Eyck, and of discovering the secret.

John de Bruges was the founder of painting as a profession in Flanders; Peter Paul Rubens was the founder of the art. This extraordinary person produced an immense number of works. He excelled equally in historical, portrait, and landscape painting; in fruits, flowers, and in animals. He both invented and executed with the greatest facility; and to show the extent of his powers, he frequently made a great number of sketches of the same subject altogether different, without allowing any time to elapse between them. The works of Rubens were destitute of that soft inspiration, productive of sweet and pleasant effects, so conspicuous in the works of Raphael; but he possessed that sprightliness of genius and strength of mind which is ever ready to burst forth in wonderful and astonishing effects. His figures appear to be the exact counter-part of his conceptions, and their creation nothing more than a simple act of the will.

His talent for design is unjustly censured, for on every occasion his design is noble and easy. He had great knowledge of anatomy, but he was hurried away by the impetuosity of his imagination and the ardor for execution; he preferred splendour to the beauty of forms, and sacrificed correctness of design too often to the magic of colours. In short, his qualities suppose a mind full of fire and vigour, rather than accuracy or profound thought. His drapery may be considered rather as fine than properly adapted to his figures: for, in the language of the art, to clothe and to give drapery are not synonymous terms. A portrait painter may excel in clothing his personages, while he is totally incapable of giving good drapery to an historical painting. His chief merit consists in colouring; though in this branch of the art he has not equalled Titian. He is the first among painters eminent for pomp and majesty; the first among those who speak to the eye, and the power of the art is often carried by him almost to enchantment.

It is evident from the works of Rubens, that his method of painting was to lay the colours in their place, one at the side of another, and mix them afterwards by a slight touch of the pencil. Titian mingled his tints as they are in nature, in such a manner as to make it impossible to discover where they began or terminated; the effect is evident, the labour is concealed. Thus Rubens is more dazzling and Titian more harmonious. In this part, the first excites the attention, the second fixes it. The carnations of Titian resemble the blush of nature; those of Rubens are brilliant and polished like satin, and sometimes his tints are so strong and separated as to appear like spots.

"Rubens (says Sir Joshua Reynolds) is a remarkable instance of the same mind being seen in all the various parts of the art. The whole is so much of a piece, that one can scarce be brought to believe but that if any one of them had been more correct and perfect, his works would not be so complete as they appear. If we should allow a greater purity and correctness of drawing, his want of sim-

PAIN TING.

licity in composition, colouring, and drapery, would appear more gross."

In his composition his art is too apparent. His figures have expression and act with energy, but without simplicity or dignity. His colouring, in which he is eminently skilled, is notwithstanding too much of what we call tinted: Throughout the whole of his works there is a proportionable want of that nicety of distinction and elegance of mind which is required in the higher walks of painting; and to this want it may be in some degree ascribed, that those qualities which make the excellency of this subordinate style appear in him with their greatest lustre. Indeed the facility with which he invented, the richness of his composition, the luxuriant harmony and brilliancy of his colouring, so dazzle the eye, that whilst his works continue before us, we cannot help thinking that all his deficiencies are fully supplied.

The Flemish school, of which Rubens is the greatest master, is remarkable for great brilliancy of colours and the magic of the *claro-obscuro*. To these may be joined a profound design, which is yet not founded on the most beautiful forms; a composition possessed of grandeur, a certain air of nobleness in the figures, strong and natural expressions; in short, a kind of national beauty, which is neither copied from the ancients nor from the Roman nor Lombard schools, but which deserves to please, and is capable of pleasing.

To speak in general terms, and without regarding a great number of exceptions, the Dutch school carries none of the above qualities to great perfection, except that of colouring. Far from excelling in the beauty of heads and forms, they seem chiefly to delight in the exact imitation of the lowest and most ignoble. Their subjects are derived from the tavern, the smith's shop, and from the vulgar amusements of the rudest peasants. The expressions are sufficiently marked; but it is the expression of passions which debase instead of ennobling human nature. One would think that they practised the art of degrading the bodies and souls of men.

It must be acknowledged, at the same time, that the Dutch painters have succeeded in several branches of the art. If they have chosen low objects of imitation, they have represented them with great exactness; and truth must always please. If they have not succeeded in the most difficult parts of the *claro-obscuro*, they at least excel in the most striking, such as in light confined in a narrow space, light illuminated by the moon or by torches, and the light of a smith's forge. The Dutch understand the gradations of colours; and by their knowledge of contrast they have arrived at the art of painting light itself. They have no rivals in landscape painting, considered as the faithful representation or picture of a particular scene; but they are far from equalling Titian, Poussin, Claude Lorrain, &c. who have carried to the greatest perfection the ideal landscape, and whose pictures, instead of being the topographical representation of certain places, are the combined result of every thing beautiful in their imagination or in nature. The Dutch, however, distinguish themselves by their perspective, by their clouds, sea-scenes, animals, fruits, flowers, and insects; and they excel in miniature painting. In short, every thing which requires a faithful imitation, colour, and a nice pencil, is well executed by the Dutch painters.

Holland has also produced history painters, as Octavius Van Been, and Vander Hilst, the rival of Vandyke, and perhaps his superior; but it is

not in the works of those artists that we find the character of the Dutch school.

Neither is the origin of their style to be derived from the works of Lucas of Leyden, though, from the time he flourished, viz. about the end of the 15th century, he may be considered as the patriarch of the Dutch school. Lucas painted in oil, in water colours, and on glass; and the kinds of his painting were history, landscape, and portrait. His picture of the Last Judgment is preserved in the Hotel-de-ville of Leyden; it possesses vast merit in point of composition, and a great variety of figures.

If miniature painting be considered as a characteristic of the Dutch school, Cornelius Pölenbourg may be regarded as the father of it. He possessed the colour, delicacy of touch, and disposition of the *claro-obscuro*, which chiefly distinguish this school; and if any thing is to be added, it is want of correctness in his design.

But if the choice of low figures is its chief characteristic, this is to be found in the greatest perfection in the works of the celebrated Rembrandt Vanryn; and it is the more offensive in this artist, as his compositions frequently required an opposite choice of figures. As his father was a miller near Leyden, his education must altogether have depended on the exertion of great talents and the study of nature. He studied the grotesque figure of a Dutch peasant, or the servant of an inn, with as much application as the greatest masters of Italy would have studied the Apollo of Belvidere, or the Venus de Medicis. This was not the manner of elevating himself to the noble conceptions of Raphael; but it was acquiring the imitation of truth in vulgar painting.

"Rembrandt (says M. Descamps) may be compared to the great artists for colour and delicacy of touch and *claro-obscuro*. It appears that he would have discovered the art, though he had been the first person that ever attempted it. He formed to himself rules and a method of colouring, together with the mixture of colours and the effect of the different tones. He delighted in the great oppositions of light and shade; and he seems to have been chiefly attentive to this branch of the art. His workshop was occasionally made dark, and he received the light by a hole, which fell as he chose to direct it on the place which he desired to be enlightened. On particular occasions he passed behind his model a piece of cloth of the same colour with the ground he wanted; and this piece of cloth receiving the same ray which enlightened the head, marked the difference in a sensible manner, and allowed the painter the power of augmenting it according to his principles.

"Rembrandt's manner of painting is a kind of magic. No artist knew better the effects of different colours mingled together, nor could better distinguish those which did not agree from those which did. He placed every tone in its place with so much exactness and harmony, that he needed not to mix them, and so destroy what may be called the flower and freshness of the colours. He made the first draught of his pictures with great precision, and with a mixture of colours altogether particular: he proceeded on his first sketch with a vigorous application, and sometimes loaded his lights with so great a quantity of colour, that he seemed to model rather than to paint. One of his heads is said to have a nose nearly as much projected as the natural nose which he copied."

Such is the power of genius, that Rembrandt, with all his faults, and they are enormous, is placed

P A I N T I N G.

among the greatest artists by M. Descamps, who saw his works, and was himself an artist. It is necessary to observe, that if Rembrandt was ignorant of the essential parts of his art, or neglected them, he was yet acquainted with expression, which alone was capable of giving animation to his works. His expressions are not noble, but they are just, lively, and executed with great judgment.

John de Laer, a miniature painter, and who made choice of his subjects from common life, deserves a distinguished place in the Dutch school. He painted hunting-scenes, the attacks of robbers, public festivals, landscapes, and sea views; and he ornamented his pictures with old ruins, and enriched them with figures of men and animals. He had a correct design, and employed vigorous and lively colouring.

Van-Ostade, although born at Lubeck, Gerard Down, Metz, Miris, Wouwermans, Berghem, and the celebrated painter of flowers Van-Huysum, belonged to the Dutch school.

The greater part of the schools of which we have treated have no longer any existence. Italy alone had four schools, and there only remain at present a very few Italian artists known to foreigners. The school of Rubens is in vain sought for in Flanders. If the Dutch school still exists, it is not known beyond the precincts of Holland. Mengs a German artist has made himself famous in our days; but it was in Italy that he chiefly improved his talents and exercised his art. M. Dietrich, another German, has made himself known to strangers; but two solitary artists do not form a school.

It now only remains to speak of the art of painting in England, where it is at present making great advances towards excellence.

Painting has been cultivated in England at several periods with various success. We shall here give the account of it from Mr. West's letter in the third number of *Academic Annals*, published by the Royal Academy of London.

"Many sovereigns of this country have noticed and patronized the fine arts. Edward the Third caused several chapels to be embellished with painted glass and enamelled monuments, as well as with paintings on the walls, representing scriptural subjects, and others from the church legends, together with portraits of then existing characters of both sexes. The chapel of St. Stephen, Westminster, was the most conspicuous.

"Henry the Seventh gave patronage to many ingenious men, both in painting, sculpture, and architecture.

"Henry the Eighth followed the example of his father, in giving patronage to eminent men. He invited those of the greatest celebrity in painting in Italy, Germany, and Flanders, to visit his capital. Raphael and Titian he wished to see at his court; and he endeavoured to draw them thither by the most splendid offers: but not succeeding in his desire, he procured several of their works; in particular the picture of St. George, by Raphael, at present in the possession of the king of Spain, and the two pictures by Titian, now in the gallery of the marquis of Stafford; the subjects of which are, Diana and Acteon, and Diana and Calisto. He was more fortunate in his invitation to Holbein, at that time famous as a portrait painter, who resided in Henry's palace, and whose works were soon spread through the kingdom.

"Charles the First, more attached to the fine arts than any of his predecessors, formed a splen-

did collection of the works of the great Italian and Flemish masters. He invited to his court Rubens and Vandyke, and other painters of considerable eminence, from Flanders and Holland; and he gloried in counting among his natural subjects Inigo Jones, his architect, and Dobson, who rose to eminence in painting. These were the two first English artists who enjoyed the patronage of royal favour.

"Charles the Second was proud to follow the liberal example of his father, in bestowing rewards on ingenious artists. He patronized most of those who visited his court from Italy, Flanders, Germany, and Holland; of which the decorative paintings on the walls in Windsor-castle, and the palace of Hampton-court, by Verrio, and others, are evident proofs; beside many pictures from poetical subjects, by Gennari, as well as portraits by several painters of considerable eminence. The favours which this monarch showered on the arts were, however, confined to foreign artists.

"Queen Anne was the first of our sovereigns who called into activity the British pencil, as the paintings in the cathedral of St. Paul's and the hospital at Greenwich, by sir James Thornhill, and others under his direction, sufficiently evince. In architecture, sir Christopher Wren was equally distinguished by her favour.

"But to form the great epocha of patronage conferred by a British king on British subjects, in painting, sculpture, and architecture, was reserved for the reign of his present Majesty, George the Third.

"In the year 1768, his majesty gave his royal sanction to a plan formed for the establishment of an academy of painting, sculpture, and architecture, of which he was graciously pleased to become the protector and patron.

"In the three branches of art which constitute that academy, he found many artists already formed: among others of considerable celebrity in painting, Reynolds, Wilson, Hayman, Gainsborough, Hoare, Danu, Mortimer, Barret, Sandby, Wright, Cotes, and West; in sculpture, Bacon, Nollekens, and Wilton; in architecture, Chambers, G. Dance, Stuart, T. Sandby, Gwyn, and the two Adams.

"At the same time, Strange, Woollett, Hall, Green, and Mac Ardell, shone with marked eminence among the engravers. The merits of our engravers, blended with the labours of the painter, opened a new avenue to fame. The harmonious softness of Strange; the united skill of Wilson and Woollett in landscape, as seen in the prints of Niobe, Phaeton, Ceyx, Celadon and Amelia, &c.; the portraits in mezzotint from sir Joshua Reynolds, by M'Ardell, Fisher, &c.; the successful combination of West with Earlom, Green, Woollett, Hall, &c. in historical works, as seen in the prints of Agrippina, Regulus, Hannibal, Wolfe, La Hogue, the Boyne, Penn, Cromwell, and the Restoration, &c. spread the celebrity of English works of art through the medium of engraving; and the circumstance of these prints rising to a higher price in every market throughout the continent than had ever been known in the annals of the arts, inspired those commercial views which afterwards produced the galleries of Shakspeare, under Boydell; the poets, under Macklin; historical, under Bowyer, &c. &c.; giving to this country a new source of commerce, highly beneficial to its interests, and unexampled in any other."

English school.—To the list of painters mentioned by West, are to be added several who unfortunately experienced no royal patronage.—Among these is Hogarth, whose unrivalled excellence in works of humour is principally known to us by the numerous engravings from his pictures.

Of the modern English school sir Joshua Reynolds was the founder, and his works still remain its greatest glory. They not only give him the most distinguished rank among the artists of the present age, but the effects produced by them on the rising artists, as well as by the elevated principles inculcated in his discourses delivered at the Royal Academy, will secure his reputation as long as England shall pay respect to superior talents. The English taste appears to be formed on the great masters, of the Italian and Flemish schools. Reynolds professed an admiration and preference of Michael Angelo, but his own works are in no point similar to that great master of design.

The names of Gainsborough and Wilson stand the highest in landscape painting.

The painters of this school have been distinguished as less rigid with regard to the forms and correctness of their drawing, than ambitious of striking and poignant effect. "Beauty," says the French Encyclopædia, "ought to be the characteristic of the English school, because the artists have it so frequently displayed before their eyes. If this beauty is not precisely similar to the antique, it is not inferior to it."

"The English school should also be distinguished for the truth of expression, because the liberty enjoyed in that country gives to every passion its natural and unbiassed operation."

The best accounts of painting and painters are to be found in the works of Leonardo da Vinci, Alberti, Lomazzo, and Bellori; and in the Lives of the Painters, by Vasari and Du Piles; Felibien's *Entretiens sur les Vies des Peintres*, and his other writings; the Discourses delivered by Reynolds in the Royal Academy of London; the various Treatises by Mengs; Richardson on Painting; and *De Arte Graphica*, by Du Fresnoy.

The later publications of Barry, Shee in his *Rhymes on Art*, and Howe in his *Inquiry into the present State of the Arts in England*, convey the most accurate information concerning the progress of painting in this country.

PAINTURE. *s. (peinture, Fr.)* The art of painting (*Dryden*).

PAIR. *s. (paire, Fr. par, Lat.)* 1. Two things suiting one another: as, a pair of gloves. 2. A man and wife (*Milton*). 3. Two of a sort; a couple; a brace (*Ray*).

PAIR. *Jugum.* In botany, applied to the leaflets in pinnate leaves; which are said to be bijugate, trijugate, &c. from having two, three, &c. pairs of leaflets. Two-paired, three-paired, &c.

To PAIR. v. n. (from the noun.) 1. To be joined in pairs; to couple (*Shakspeare*). 2. To suit; to fit as a counterpart (*Shakspeare*).

To PAIR. v. a. 1. To join in couples (*Dryden*). 2. To unite as correspondent or opposite (*Pope*).

PAIRING, the uniting or joining in couples. The instinct of pairing is bestowed on every species of animals to which it is necessary for rearing their young; and on no other species.

Pal. All wild birds pair; but with a remarkable difference between such as place their nests on trees and such as place them on the ground. The young of the former, being hatched blind, and without feathers, require the nursing care of both parents till they be able to fly. The male feeds his mate on the nest, and cheers her with a song. As soon as the young are hatched, singing yields to a more necessary occupation, that of providing food for a numerous issue; a task that requires the exertions of both parents.

Eagles and other birds of prey build on trees, or on other inaccessible spots. They not only pair, but continue in pairs all the year round; and the same pair procreates year after year. This at least is the case of eagles: the male and female hunt together, unless during incubation, at which time the female is fed by the male. A greater number than a single pair are never seen in company.

Gregarious birds pair in order probably to prevent discord in a society confined to a narrow space. This is the case particularly of pigeons and rooks. The male and female sit on the eggs alternately, and divide the care of feeding their young.

Partridges, plovers, pheasants, sea-fowl, grouse, and other kinds that place their nests on the ground, have the instinct of pairing; but differ from such as build on trees in the following particular, that after the female is impregnated, she completes her task without needing any help from the male. See **ORNITHOLOGY**.

PAISHAWUR, a city of Hindustan Proper, capital of a district in the country of Cabul. It is situate on the Kameh, 125 miles S.E. of Cabul, and 170 N. of Moultan. Lon. 70. 36 E. Lat. 33. 18 N.

PAISLEY, a town in Renfrewshire, with manufactures of silk and thread gauze, and extensive cotton works. Its streets have names descriptive of the various employments of the inhabitants; such as Silk Street, Cotton Street, Lawn Street, &c. The magnificent abbey, for which it was once noted, is now partly in ruins; but there is a chapel entire, which is used as the family burial-place of the marquises of Abercorn, and is famous for a surprising echo. Paisley contains about thirty-two thousand inhabitants, but it stands on nearly as much ground as Glasgow, and is six miles W. of that city. Lon. 4. 20 W. Lat. 55. 52 N.

PAITA, a seaport of Peru, in the audience of Quito, with an excellent harbour. It has frequently been plundered by the buccaneers; and, in 1741, it was plundered and burnt, by commodore Anson, because the governor refused to ransom it. Lon. 81. 19 W. Lat. 6. 12 S.

PALACE, **PALATIUM**, a name generally given to the dwelling-houses of kings, princes, and other great personages; and taking different epithets, according to the quality of the inhabitants, as imperial palace, royal palace, pontifical palace, cardinal palace, ducal palace, episcopal palace, &c.

PALACIOS, a town of Spain, in Andalu-

sia, 12 miles S. of Seville. Lon. 5. 24 W. Lat. 37. 20 N.

PALÆMON, or **PALEMON**, a sea deity, son of Athamas and Ino. His original name was Melicerta. (See **MELICERTA**.) 2. A noted grammarian at Rome in the age of Tibertius, who made himself ridiculous by his arrogance and luxury.

PALÆSTRA, in Grecian antiquity, a public building where the youth exercised themselves in wrestling, running, playing at quoits, &c. To prevent the combatants from hurting themselves by falling, the bottom of the palæstra was covered with dust or gravel. Some will have the palæstra to be only a part of the gymnasium. Many authors imagine that the palæstra was of two kinds; the one for the exercise of the body, the other for the cultivation of the mind: but the derivation of the word seems to confine it to bodily exercise.

PALAOFOX (John de), a Spaniard, patronized by Philip II. and appointed bishop of Los Angeles, in America, with the title of judge of the administration of the three viceroyalties of the Indies. In this office, though he had to encounter the prejudices of the jesuits, he maintained his character of moderation and of benevolence towards the unfortunate natives, and was made by the king bishop of Osma, 1653. He died 1659, universally respected. He wrote the history of the siege of Fontarabia, 4to.—history of the conquest of China by the Tartars, 8vo.—sermons, and religious tracts.

PALAIS, a town of France, capital of the island of Belleisle, off the coast of Bretagne. It has a strong citadel, which stood a long siege against the English, in 1761, and then surrendered on honourable terms. Lon. 3. 2 W. Lat. 47. 18 N.

PALAIS (St.), a town and district of France, in the department of Lower Pyrenees, which, with the town and district of St. John-Pied-de-Port, forms nearly the whole of the late province of Lower Navarre. This is only a very moderate portion of the kingdom of Navarre, wrested, in 1512, from John d'Albert, by Ferdinand, king of Arragon and Castile. This portion, separated from Upper Navarre by the Pyrenees, made part of the kingdom of France, having been annexed to it by Henry IV. who held it in right of his mother, Jeanne d'Albert. St. Palais is seated on the Bidouse, 15 miles S.E. of Bayonne. Lon. 1. 4 W. Lat. 43. 21 N. See **NAVARRÉ**.

PALAMBOANG, or **PALAMBANG**, a town of Java, capital of a kingdom; seated at the E. end of the island, on the straits of Bally. Lon. 114. 0 E. Lat. 7. 10 S.

PALAMCOTTA, or **TINEVELLY**, a town of Hindustan, in the Carnatic, 410 miles S.W. of Madras. Lon. 77. 54 E. Lat. 8. 43 N.

PALAMEDIA. Screamer. In zoology, a genus of the class aves, order grallæ. Bill conic, the upper mandible hooked; nostrils oval; feet four-toed, cleft, a very small membrane connecting the toes at the root. Two species.

1. **P. cornuta**. Horned screamer. Wings with two spines at the head; front horned. Inhabits the fenny and maritime parts of South America; three feet four inches long; always found in pairs, and feeds on herbs, seeds and reptiles; makes a nest of mud shaped like an oven, and lays two eggs; when alarmed rises from the ground, with a loud and continued screaming.

2. **P. cristata**. Crested screamer. Wings unarmed; front crested.

The offensive armour of the first species is peculiarly formidable. When the wings are folded, the two spurs upon each are directed forward, and appear to be elongations of the bones of which they are formed. The upper spur, on each wing, is two inches long, bending a little upwards, and terminating in a sharp point; the lower one is not more than half an inch in length, but nearly as thick. All those protuberances are of an horny substance, and, towards the base, covered with a kind of case, like the barrel of a large pen. With this formidable apparatus of offensive armour, the screamer is the most gentle of all animals; he never attacks another bird; his depredations being confined to the worms upon which he feeds. Such fidelity and attachment do these birds display, that the male and female continue inseparably together till death; and when one of them dies, the affliction which united them, and pangs of grief for its loss partner, are long felt by the other. It is even said, that the disconsolate survivor wanders constantly around the place where its partner died, till, consumed with grief, it dies also.

The first species is about the size of a large swan. It is called by the natives kamichi. The head and upper part of the neck are covered with short bristly feathers; the rest of the plumage being longer, and of a dark brown colour mixed with a shade of green. The second species is called cariamia; it is not larger than a heron; and as we have just observed, has, instead of the horn rising from the crown of the head, a feather standing up like a crest. The whole plumage of this species is grey, covered with brown; and nearly resembles that of the falcon. The kamichi and cariamia are, by some naturalists, classed into two separate genera. In their general air and form, however, as well as in their manner of life, there is a similarity that indicates them both to belong to one tribe. They both live on marshy ground, and are supported, probably, by the same kinds of food. They are equally distinguished by the nakedness of their legs, and by their loud and piercing voice, though that of the cariamia is inferior in strength to that of the kamichi. In America, this bird is by its voice discovered by the hunters, who pursue it for its flesh, and have begun to domesticate it from the same motive.

PALAMEDES, a Grecian chief, son of Nauplius, king of Eubœa by Clymene. He was sent by the Greek princes, going to the Trojan war, to bring Ulysses to the camp,

who, to avoid the expedition, pretended insanity, and used to sow salt instead of barley in the furrows. The deceit was soon perceived by Palamedes, and to demonstrate it, he took Telemachus, his son, and put him before the plough of his father. Ulysses showed that he was not insane, by turning the plough a different way not to hurt his child. This having been discovered, Ulysses was obliged to attend the Greek princes to the war, but an immortal enmity arose between Ulysses and Palamedes. The king of Ithaca bribed one of his servants, and made him dig a hole in his master's tent, and there conceal a large sum of money. After this Ulysses forged a letter, which king Priam was supposed to have sent to Palamedes, desiring that, according to the conditions which were previously agreed upon, when he received the money, he should betray the Grecian army. This letter was carried before the Grecian princes. Palamedes was summoned, and protested his innocence, but all was in vain, the money was discovered in his tent. He was found guilty by all the army, and stoned to death. Homer is silent about the miserable fate of Palamedes. Palamedes was a learned man as well as a soldier, and according to some he completed the alphabet of Cadmus by the addition of the four letters θ , ξ , χ , ϕ , during the Trojan war. To him also is attributed the invention of dice and backgammon; and it is said that he was the first who regularly ranged an army in a line of battle, and who placed sentinels round the camp, and excited their vigilance and attention, by giving them a watch word.

PALAMOS, a strong seaport of Spain, in Catalonia, seated on the Mediterranean, 47 miles N.E. of Barcelona. Lon. 2. 58 E. Lat. 41. 58 N.

PALAMOW, a town of Hindustan Proper, in the province of Bahar, 210 miles S.S.W. of Patna. Lon. 84. 10 E. Lat. 23. 40 N.

PALA'NQUIN. *s.* A kind of covered carriage, used in the eastern countries, that is supported on the shoulders of slaves.

PALAEOS ISLANDS. See **PHILIPPINES**, New.

PA'LATABLE. *a.* (from *palate*.) Gustful; pleasing to the taste (*Philips*).

PA'LATE. *s.* (*palatum*, Latin). 1. The instrument of taste; the upper part or roof of the mouth (*Hakewill*). 2. Mental relish; intellectual taste (*Taylor*).

PALATE, in botany. Gibbositas prominens in fauce corollae. Philos. Bot. Processus labii inferioris superiora versus quo rictus occluditur. Delin. Pl. A prominence in the throat of a corol in labiate flowers; or a process of the lower lip, extending towards the upper part, by which the gape or opening is closed.

PALATI CIRCUMFLEXUS, in myology. See **CIRCUMFLEXUS**.

PALATI LEVATOR. See **LEVATOR PALATI**.

PALATI OSSA, in osteology. (from *palp*, to

hedge in, because it is staked in as it were by the teeth.) These bones are of a very irregular figure. They are placed between the ossa maxillaria superiora and the os sphenoides, at the back part of the roof of the mouth, and extend from thence to the bottom of the orbit. Each of these bones may be divided into four parts; viz. the inferior or square portion, the pterygoid process, the nasal lamella, and orbital process. The first of these, or the square part of the bone, helps to form the palate of the mouth. The upper part of its internal edge rises into a spine, which makes part of the septum narium. The pterygoid process, which is smaller above than below, is so named from its being united with the pterygoid processes of the sphenoid bone, with which it helps to form the pterygoid fossae. It is separated from the square part of the bone, and from the nasal lamella, by an oblique fossa, which, applied to such another in the os maxillare, forms a passage for a branch of the fifth pair of nerves. The nasal lamella is nothing more than a very thin bony plate, which arises from the upper side of the external edge of the square part of the bone. Its inner surface is concave, and furnished with a ridge which supports the back part of the os spongiosum inferius. Externally, it is convex, and firmly united with the maxillary bone. The orbital process is more irregular than any other part of the bone. It has a smooth surface where it helps to form the orbit; and, when viewed in its place, we see it contiguous to that part of the orbit which is formed by the os maxillare, and appearing as a small triangle at the inner extremity of the orbital process of this last mentioned bone. This fourth part of the os palati likewise helps to form the zygomatic fossa on each side, and there its surface is concave. Between this orbital process and the sphenoid bone, a hole is formed, through which an artery, vein, and nerve, are transmitted to the nostrils. The ossa palati are complete in the fœtus. They are joined to the ossa maxillaria superiora, os sphenoides, os ethmoides, ossa spongiosa inferiora, and vomer.

PALATI TENSOR. See **CIRCUMFLEXUS**.

PA'LATIC. *a.* (from *palate*.) Belonging to the palate, or roof of the mouth (*Holder*).

PALATINATE, a province or signiory possessed by a palatine.

PALATINE, or **COUNT PALATINE**, a title anciently given to all persons who had any office or employment in the prince's palace: but afterwards conferred on those delegated by princes to hold courts of justice in the provinces; and on such among the lords as had a palace, that is, a court of justice, in their own houses.

PALATINE (Counties) in England. Chester, Durham, and Lancaster, are called counties-palatine. The two former are such by prescription, or immemorial custom; or, at least as old as the Norman conquest: the latter was created by king Edward III. in favour of Henry Plantagenet, first earl and then duke

of Lancaster; whose heiress being married to John of Gaunt, the king's son, the franchise was greatly enlarged and confirmed in parliament, to honour John of Gaunt himself, whom, on the death of his father-in-law, the king had also created duke of Lancaster. Counties-palatine are so called a *palatio*; because the owners thereof, the earl of Chester, the bishop of Durham, and the duke of Lancaster, had in those counties *jura regalia*, as fully as the king hath in his palace; *regalem potestatem in omnibus*, as Bracton expresses it. They might pardon treasons, murders, and felonies; they appointed all judges and justices of the peace; all writs and indictments ran in their names, as in other counties in the king's; and all offences were said to be done against their peace, and not, as in other places, *contra pacem domini regis*. And indeed by the ancient law, in all peculiar jurisdictions, offences were said to be done against his peace in whose court they were tried; in the court-leet, *contra pacem domini*; in the court of a corporation, *contra pacem ballivorum*; in the sheriff's court or tourn, *contra pacem vicecomitis*. These palatine privileges (so similar to the regal independent jurisdictions usurped by the great barons on the continent during the weak and infant state of the first feudal kingdoms in Europe) were in all probability originally granted to the counties of Chester and Durham, because they bordered upon enemies' countries, Wales and Scotland: in order that the owners, being encouraged by so large an authority, might be the more watchful in its defence; and that the inhabitants, having justice administered at home, might not be obliged to go out of the county, and leave it open to the enemy's incursions. And upon this account also there were formerly two other counties-palatine, Pembrokeshire and Hexhamshire, the latter now united with Northumberland; but these were abolished by parliament, the former in 27 Hen. VIII. the latter in 14 Eliz. And in 27 Hen. VIII. likewise, the powers before mentioned of owners of counties-palatine were abridged; the reason for their continuance in a manner ceasing: though still all writs are witnessed in their names, and all forfeitures for treason by the common law accrue to them. Of these three, the county of Durham is now the only one remaining in the hands of a subject.

The Isle of Ely is sometimes called a county-palatine; but that is erroneous: that is only a royal franchise, the bishop exercising jurisdiction by grant of king Henry I.

PALATINUS MONS, the largest of the seven hills on which Rome was built. Upon it Romulus laid the first foundation of the capital of Italy, and there also he kept his court, as well as Tullus Hostilius, and Augustus, and all the succeeding emperors, from which circumstance the word *palatinum* has since been applied to the residence of a prince. Apollo, who was worshipped on the Palatine hill, was also called Palatinus. His temple there had been built by Augustus, who had enriched it with a library, valuable for the various collec-

tions of Greek and Latin manuscripts which it contained.

PALATO-PHARYNGEUS. *Musculus palato-pharyngeus*. Thyro-staphilinus of Douglas. Thyro-pharyngo-staphilinus of Winslow. A muscle situated at the side of the entry of the fauces. It arises by a broad beginning from the middle of the *velum pendulum palati* at the root of the uvula posteriorly, and from the tendinous expansion of the *circumflexus palati*. The fibres are collected within the posterior arch behind the tonsils, and run backwards to the top and lateral part of the pharynx, where the fibres are scattered and mixed with those of the *stylo-pharyngeus*. It is inserted into the edge of the upper and back part of the thyroid cartilage. Its use is to draw the uvula and *velum pendulum palati* downwards and backwards, and at the same time to pull the thyroid cartilage and pharynx upwards, and shorten it; with the constrictor superior pharyngis and tongue, it assists in shutting the passage into the nostrils; and in swallowing, it thrusts the food from the fauces into the pharynx.

PALATO-STAPHILINUS. See **STAPHILINUS**.

PALAVIA, in botany, a genus of the class monadelphia, order polyandria. Calyx single, five-cleft; style many-cleft; capsules numerous, collected into a head without order. Two species; natives of Lima; branching decumbent plants, with purple and purplish yellow flowers.

PALE. *a.* (*pale*, Fr. *pallidus*, Latin.) 1. Not ruddy; not fresh of colour; wan; white of look (*Shakspeare*). 2. Not high coloured; approaching to colourless transparency (*Arbutnot*). 3. Not bright; not shining; faint of lustre; dim (*Shakspeare*).

To PALE. *v. a.* (from the adjective.) To make pale (*Prior*).

PALE. *s.* (*palus*, Latin.) 1. Narrow piece of wood joined above and below to a rail, to enclose grounds (*Shakspeare*). 2. Any enclosure (*Hooker*). 3. Any district or territory (*Clarendon*). 4. The *pale* is the third and middle part of the scutcheon (*Peucham*).

To PALE. *v. a.* (from the noun.) 1. To enclose with pales (*Mortimer*). 2. To enclose; to encompass (*Shakspeare*).

PALEA. In botany, a chaff. Lamella receptaculo innata flosculos distinguens. A thin membrane, springing from the receptacle, and separating the florets, in some aggregate flowers. Hence such a receptacle is called

PALEACEOUS, or **CHAFFY**. As in *dipsacus*, *scabiosa*, &c. See **CHAFFY**.

PALEACEOUS PAPPUS. A chaffy crown or down to some seeds; as in *bidens*, *silphium*, *tagetes*, *coreopsis*, &c.

PALEARIUS (Aonius), an eminent writer, born at Veroli, near Rome. He resided near Sienna, where he instructed some pupils in the learned languages. Here he had an unfortunate quarrel with a rival in literature, and afterwards, in consequence of his able defence of a certain nobleman, against the monks, he became an object of persecution, and retired to

Lucca, and next to Milan. Here he found himself exposed to fresh persecution; he was again accused by the monks of heresy, and being carried to Rome was condemned and burnt to death, 1566. The best known of his works is his Latin poem on the immortality of the soul, 3 vols. 8vo.

PA'LEEYED. *a.* (*pale* and *eye*.) Having eyes dimmed (*Pope*).

PA'LEFACED. *a.* (*pale* and *face*.) Having the face wan (*Shakspeare*).

PA'LELY. *ad.* (from *pale*.) Wanly; not freshly; not ruddily.

PALENCIA, a town of Spain, in Leon, and a bishop's see, with five churches, eleven convents, and two hospitals. It is seated on the Carrion, 23 miles N.N.E. of Valladolid, and 70 S.E. of Leon. Lon. 4. 28 W. Lat. 41. 59 N.

PA'LENESS. *s.* (from *pale*.) 1. Wanness; want of colour; want of freshness; sickly whiteness of look (*Pope*). 2. Want of colour; want of lustre (*Shakspeare*).

PA'LENDAR. *s.* A kind of coasting vessel.

PA'LEOUS. *a.* (*palea*, Lat.) Husky; chaffy.

PALERMO, a fortified city of Sicily, in Val di Mazara, capital of the island, and an archbishop's see. It stands on a bay of the same name, on the N. coast, near the extremity of a kind of natural amphitheatre, formed by high and rocky mountains. The country between the city and the mountains is one of the richest plains in the world; the whole appearing a magnificent garden, filled with fruitful trees, and watered by fountains and rivulets. The inhabitants of Palermo are estimated at 130,000. Two great streets intersect each other in the centre of the city, where they form a handsome square, called the Ottangolo, from the centre of which is seen the whole of these noble streets, and the four elegant gates which terminate them, each at the distance of half a mile. The Porto Felice opens to the Marino, a delightful walk, which has on one side the wall of the city, and on the other the sea; and in the centre is an elegant kind of temple, frequently made use of as an orchestra. The churches of Palermo are upward of 300, and many of them very rich and magnificent. The cathedral is a large Gothic structure, supported within by 80 columns of oriental granite, and divided into a great number of chapels, some of which are extremely rich, particularly that of St. Rosalia, the patroness of Palermo. The relics of this saint are preserved in a large box of silver, enriched with precious stones; and they are considered as the greatest treasures of the city. Here are also found the tombs of several of the ancient Norman kings, and of the emperors Henry VI. and Frederic II. of the finest prophery. The city is crowded with statues of sovereigns and tutelar saints placed in small courts and squares, upon pedestals of colossal proportion and tasteless form. In the streets women hide their heads in black veils; a very ancient mode of dress in this island. This city has suffered greatly at different periods, by earthquakes and inundations. The

harbour, defended by two castles, is dangerously open to the sea from the N.E.; and, even at the anchoring place, ships are in danger when a westerly wind rushes through the valley of Colli between the mountains. About the middle of the 11th century, the Norman king Roger established silk manufactures in this city, by means of prisoners taken in his war with the Greeks, and they still flourish, though not so lucrative since the manufacture has extended to Italy. One mile from Palermo is a celebrated convent of capuchins, in which is a vault made use of as a receptacle for the dead. It consists of four wide passages, each about forty feet in length, with arches along the sides, in which the bodies are set upright, clothed in coarse garments, with their heads, arms, and feet bare. They are prepared for this situation by keeping them six or seven months upon a gridiron, over a slow fire, till all the fat and moisture are consumed. In some of the higher niches they are laid out at full length, and at the top are children of six or seven years of age. On the floor are handsome trunks, containing the bodies of persons of distinction, the keys of which are kept by the relations. Palermo, in 1799, became the residence of the court, when the French made themselves masters of Naples. It is 110 miles W. of Messina, and 180 S. by W. of Naples. Lon. 13. 23 E. Lat. 38. 15 N.

PALES, the goddess of sheepfolds and of pastures among the Romans, was worshipped with great solemnity at Rome, and her festivals called Palilia, were celebrated the very day that Romulus began to lay the foundation of the city of Rome.

PALESTINE, in its present state, is a part of Asiatic Turkey situated between 31° 30' and 33° 20' north latitude, and between 34° 50' and 37° 15' east longitude. It is bounded by Mount Libanus, which divides it from Syria, on the north; by Mount Hermon, which separates it from Arabia Deserta, on the east; by the mountains of Seir and the deserts of Arabia Petræa, on the south; and by the Mediterranean sea on the west.

This once fertile and happy spot was first called the land of Canaan, or Chanaan, from Noah's grandson. In Scripture, however, it is frequently distinguished by other names; such as the Land of Promise, the Land of God, the Land of Israel, &c. It received the name of Palestine from the Palestines, or Philistines, who possessed a great part of it; and it had the name of Judæa, or Judæa Palestina, from Judah, the most considerable of the twelve sons of Jacob. The Christians have denominated it the Holy Land; partly on account of the many singular blessings it received from the Divine Providence, and partly on account of its metropolis being made the centre of God's worship and his peculiar habitation; but much more for its being the place of our Saviour's birth, the scene of his preaching and manifold miracles; especially the place in which he accomplished the great work of our redemption. As to the name of Judæa; it did not

begin to receive that till after the return of the Jews from the Babylonish captivity, though it had been styled long before the Kingdom of Judah, in opposition to that of Israel, which revolted from it under Jeroboam, in the reign of Rehoboam the son of Solomon. But after the return, the tribe of Judah, the only one that made any figure, settling at Jerusalem, and in the countries adjacent, quickly gave its name to the whole territory. By profane authors it was called by many different names; such as Syria, Palestina Syria, Coelesyria, Iduma, Idumæa, and Phœnicia or Phœnice; but these are supposed only to have been given out of contempt to the Jewish nation, whom they looked upon as unworthy of any other name than what distinguished the most obscure parts of the neighbouring provinces.

That part of the country which was properly called the Land of Promise, was inclosed on the west by the Mediterranean; on the east by the lake Asphaltites, the Jordan, and the sea of Tiberias or of Galilee, and the Samachonite lake; to the north it had the mountains of Libanus, or rather of Antilibanus, or the province of Phœnicia; and to the south, that of Edom or Idumæa, from which it was likewise parted by another ridge of high mountains. The boundaries of the other part, which belonged to the two tribes and an half beyond the river Jordan, are not so easily defined, as well as those of the conquests made by the more prosperous kings of the Jews. All that can be said with any probability is, that the river Arnon was the first northern boundary on that side; and with respect to those on this side the Jordan, there is a considerable disagreement between the Hebrew and Samaritan versions of the Pentateuch.

The extent of this country is likewise variously settled by geographers; some giving it no more than 170 or 180 miles from north to south, and 140 in breadth where broadest, though not much above half that breadth where narrowest. But from the latest and most accurate maps, it appears to extend near 200 miles in length, and about 80 in breadth about the middle, and about 10 or 15, more or less, where it widens or shrinks.

For a minute account of Palestine we cannot do better than refer to Wells's Scripture Geography.

PALESTRINA, one of the largest of the islands called the Lagunes, near Venice. It has a town of the same name, six miles S. of Venice.

PALESTRINA, anciently Præneste, an episcopal town of Italy, in Campagna di Roma, with the title of a principality. Here formerly stood a temple dedicated to Fortune, the ruins of which may yet be seen. It is 25 miles E. by S. of Rome. Lon. 13. 5 E. Lat. 41. 52 N.

PALETTE. *s.* (*palette*, French.) A light board on which a painter holds his colours when he paints (*Tickel*).

PALEY (William), an eminent divine, born at Peterborough, 1743. He was educated under his father who was a clergyman, at Gigg-

swick school, Yorkshire, and then at Christ's college, Cambridge. He was for three years after assistant at Greenwich school, and then became an active tutor in his college, and had for his coadjutor Dr. Law, afterwards bishop of Elphin. By the kindness of his friend's father, who was bishop of Carlisle, he obtained a living in Cumberland, and next Appleby, in Westmorland, and a prebend in Carlisle cathedral, and the living of Dalston. In 1780 he was made chancellor of Carlisle, and in 1785 he published his *Elements of Moral and Political Philosophy*, in 4to. a most valuable work, often reprinted, in 2 vols. 8vo. In 1780, he declined the mastership of Jesus college, Cambridge, which the bishop of Ely wished to confer upon him. He was afterwards presented to a prebend at St. Paul's, and to the living of Bishop Wearmouth. He published, in 1790, *Horæ Paulinæ*, or the truth of the scripture history of St. Paul, &c. 8vo.—a *View of the Evidences of Christianity*, 3 vols. 8vo. 1794, dedicated to the bishop of Ely.—*Natural Theology*, 8vo, 1802; besides some single sermons. He died at Sunderland, in 1805, aged 62 years. Since his death a volume of posthumous sermons has been published, several of which are very excellent.

The works of this very able author are most highly and deservedly esteemed. His *Moral Philosophy* is in many respects an admirable work, though the theory of expediency which he adopts is open to many abuses, which have been ably exposed by Mr. Gisborne. The political speculations, if not the most valuable part of his work, are certainly that part in which his talents are most eminently displayed. His observations on the laws and constitution of this kingdom shew that he had imbibed very largely the spirit of our jurisprudence, and are founded upon enlarged views, such as are rarely taken by those who, in the course of their professional studies, make greater legal acquisitions. The chapters in which he discusses the duties and interests of those who govern kingdoms are no less worthy of attention; and in the latter part of the volume he investigates the causes of national prosperity, and the means by which they may be rendered most efficacious, with a degree of skill and originality which may justly intitle him to be ranked among the greatest masters of the science of political economy. The political writings of Dr. Paley have been studied and admired by the most illustrious statesmen of the present times. It would be useless to enumerate the praises with which they have been honoured; but the last and perhaps the most enviable that were bestowed on them were connected with circumstances so peculiar as to be deserving of mention. In the debate on the catholic question twelve days before his death, Mr. Fox in the House of Commons read two passages from his work which contained the leading ideas of the celebrated speech delivered on that occasion. Both of these Mr. Fox prefaced with very high compliments, and when speaking of the first said, that the author, though living,

ought not to be defrauded of his due praise, and that he therefore would not conceal his name. This expression was imperfectly understood by most of the reporters, who in their accounts of the debate represented Mr. Fox as describing him to be not living, and spread about the kingdom false intelligence that he was dead just when he was labouring under the illness which was the cause of his death.

Dr. Paley's View of the Evidences of Christianity is justly esteemed the most decisive work which has ever been published on the subject. His *Horæ Paulinæ* is not the most popular of his works, though it perhaps is that which is most admired by his judicious readers for the originality of the design and the vigour of the execution. It is an exposition and consideration of the evidences of the truth of the christian religion, which may be derived from the conversion and ministry of St. Paul, and especially from the numerous obviously undesigned coincidences between Paul's Epistles and the history of the Acts of the Apostles, written by Luke. Dr. Paley professes to have chosen the subject of his work on Natural Theology, because, with those he had already treated of, it formed a system which was complete, though its parts had been produced in an inverted order. In his Natural Theology, *Horæ Paulinæ*, and Evidences of Christianity, he proved the truth of religion, natural and revealed; and in his Moral and Political Philosophy taught the duties which result from and are sanctioned by the proof. He had undoubtedly another reason for the choice of this subject, that it was eminently adapted to his talents. To reason perspicuously and illustrate happily, were the powers by which he was most distinguished, and what other subject offered such admirable materials to exercise them? He has traced and shewn the marks of wisdom and design in various parts of the creation, but has dwelt principally on those which may be discovered in the constitution of the human body. The book contains almost a complete treatise of anatomy, which, by the observations he has interspersed, and by the excellence of his descriptions, he has contrived to render interesting even to those who read without any previous knowledge of the science. To be secure of immortality an author must be recommended either by striking excellencies of language or of sentiment, or by an happy arrangement of the parts of his subject, which renders them necessary to each other and incapable of separation. Valuable matter cannot alone preserve the name of the author, for of that he may be plundered by the writers of a succeeding age, who being able to consult its taste, will necessarily be more popular than an ancient whose productions have not some intrinsic superiority. Dr. Paley is not remarkable for elegant periods or splendid sentiments. He seems to have been less ambitious of pleasing the ear than of informing the understanding; for if we except the dedication of the Moral and Political Philosophy, some chapters in the same work (particularly that On reve-

rencing the Deity), and the conclusion of the Natural Theology, which contain some of the most elegant and dignified passages to be found in the language; the general characteristic of his writings is plainness and simplicity. But this is the genuine didactic style, and he has imparted to it all those numerous graces of which it is capable. It will be universally allowed that no author ever wrote so pleasingly on the subjects he has treated of. The force and terseness of his expressions is not less admirable than the strength of his conceptions, and there is both in his language and his ideas a peculiarity of manner stamped by the vigour and independence of his mind, which cannot be borrowed, and which will therefore perpetuate his reputation. He has merit to deserve readers, and allurements to attract them, and will preserve a high rank among those writers of his country, who can command the attention of posterity. He is one of the best writers of what may be called the English matter of fact style, that ever lived.

During the greater part of Dr. Paley's life he was a most decided Socinian; during the last three or four years, however, he seems to have examined doctrinal points with great attention: and the consequence was, as might naturally be expected, a total change in many of his sentiments. Several of his posthumous sermons are quite evangelical in sentiment; and if they are not all so, it has happened, we conjecture, from the gradual change in his views during the latter part of his life, and his inability during his last illness to give those sermons such a revival as he would have done, had he intended their publication.

PALFREY, is one of the better sort of horses used by noblemen or others for state; and sometimes of old taken for a horse fit for a woman to ride. Camden says, that William Fauconberge held the manor of Cukeny, in the county of Nottingham, in serjeantry, by the service of shoeing the king's palfrey when the king should come to Mansfield.

PALFREYED, *a.* (from *palfrey*.) Riding on a palfrey (*Ticket*).

PALICAUT, a fort of Hindustan, in Malabar, built by Hyder, on his conquest of that province. Around it are scattered many villages, which contain a considerable population and have some trade. It stands between two rivulets, near their junction, at the foot of the southern extremity of the Gauts, 25 miles W.S.W. of Coimbatore, and 56 E. by N. of Paniany.

PALIFICATION, *s.* (*palus*, Lat.) The act or practice of making ground firm with piles (*Wotton*).

PALICI, or PALISCI, two deities, sons of Jupiter by Thalia, whom Æchylus calls Ætna, in a tragedy now lost. According to Macrobius, Ætna, when pregnant, entreated Jupiter to remove her from the pursuits of Juno. The god concealed her in the bowels of the earth, and when the time of her delivery was come, the earth opened and brought into the world two children, who received the name of Palici;

quasi, ἀπὸ τοῦ παλιν μισθαι, because they came again into the world from the bowels of the earth. These deities were worshipped with great ceremonies by the Sicilians.

PALILIA, a festival celebrated by the Romans, in honour of the goddess Pales. The ceremony consisted in burning heaps of straw, and in leaping over them. The purification of the flocks was made with the smoke of sulphur, of the olive, the pine, the laurel, and the rosemary. Offerings of mild cheese, boiled wine, and cakes of millet were afterwards made to the goddess. This festival was observed on the 21st of April. Some call this festival *Parilia quasi a pariendo*, because the sacrifices were offered to the divinity for the fecundity of the flocks.

PALIMBAN, the capital of a kingdom of the same name, on the S.E. coast of the island of Sumatra. The Dutch have a fort here, and purchase large quantities of pepper. It stands on the river Palimban, about 50 miles from the sea, and 130 N.E. of Bencoolen. Lon. 103. 45 E. Lat. 2. 56 S.

PALINDROMUS, a verse or sentence which runs the same when read either backwards or forwards. Such is the verse, *Roma tibi subito motibus ibit amor*. Some people of leisure have refined upon the palindromus, and composed verses, each word of which is the same backwards as forwards; for instance, that of Camden:

*Odo tenet mulum, madidam mappam tenet Anna.
Anna tenet mappam, madidam mulum tenet Odo.*

PALINGENESIA, among divines, the same with regeneration. Among chemists, it denotes the producing of a body from its principles.

PALINGENIUS (Marcellus), an Italian poet of the 16th century, born in Ferrara. He wrote and dedicated to his patron Hercules II. duke of Ferrara, his poem in 12 books, called *Zodiacus Vitæ*; but he spoke with such freedom of the popish clergy, that not only the book was prohibited, but the body of the author was ordered to be dug up and burnt, which was, however, prevented by the duchess of Ferrara.

PALINODE, **PA'LINODY**. *s.* (*παλινωδια*.) A recantation (*Sandys*).

PALINURUS, in fabulous history, a skillful pilot of the ship of Æneas. He fell into the sea in his sleep, and was three days exposed to the tempests and agitation of the sea, and at last came safe to the sea shore, where the cruel inhabitants of the place murdered him. Æneas, when he visited the infernal regions, saw Palinurus, and assured him, that though his bones were deprived of a funeral, yet the place where his body was exposed should soon be adorned with a monument, and bear his name, and accordingly a promontory was called Palinurus.

PALISADES, in fortification, stakes made of strong split wood, about nine feet long, six or seven inches square, three feet deep in the ground, in rows about two and a half or three

inches asunder, placed in the covert way, at three feet from, and parallel to the parapet or side of the glacies, to secure it from surprise. They are also used to fortify the avenues of open forts, gorges, half moons, the bottoms of ditches, and in general all posts liable to surprise. They are usually fixed perpendicularly, though some make an angle inclining towards the ground next the enemy, that the ropes cast over them to tear them up may slip off.

To PALISA'DE. v. a. (from the noun.) To enclose with palisades.

PALISH. *a.* Somewhat pale.

PALK STRAIT, a strait at the north end of the island of Ceylon, in the bay of Bengal, which separates that island from the coast of Tanjore in Hindustan. It is celebrated for the extensive pearl fishery which is carried on in it, on both shores, lately by the Dutch, and now by the English.

PALL. *s.* (*pallium*, Latin.) 1. A cloak or mantle of state (*Milton*). 2. The mantle of an archbishop (*Ayliffe*). 3. The covering thrown over the dead (*Dryden*).

To PALL. v. a. (from the noun.) To cloak; to invest (*Shakspeare*).

To PALL. v. n. (perhaps a corruption of *pale*.) To grow vapid; to become insipid (*Addison*).

To PALL. v. a. 1. To make insipid or vapid (*Atterbury*). 2. To make spiritless; to dispirit (*Dryden*). 3. To weaken; to impair (*Shakspeare*). 4. To cloy (*Tatler*).

PALL, in heraldry, a figure like a Greek π , about the breadth of a pallet; it is by some heralds called a cross-pall, on account of its being looked upon as an archiepiscopal bearing.

PALLA, in Roman antiquity, a mantle which women wore over the gown called *stola*. It was borne on the left shoulder; whence passing to the other side, under the right arm, the two ends were bound under the left arm, leaving the breast and arm quite bare. It had a great many folds, and derived its name from *παλλω*, to shake or tremble.

PALLADIO (Andrew), an Italian architect, born at Vicenza, in Lombardy. He was early instructed in architecture, and by visiting Rome he viewed and studied the venerable relics of ancient times. He made very beautiful drawings of these precious monuments, and published them with commentaries, and afterwards gave to the world his four books of architecture, in 1570, a work translated into French, and also into English, and commented upon by Inigo Jones. His most magnificent edifice is the theatre called *Degli Olimpici* at Vicenza. He died 1580.

PALLADIUM, a celebrated statue of Pallas, representing the goddess as sitting and holding a pike in her right hand, and in her left a distaff and a spindle. It is said it fell down from heaven near the tent of Ilus, as that prince was building the citadel of Ilium. Others give it a different origin, but however discordant their opinions be about this famous

statue, it is universally agreed, that on its preservation depended the safety of Troy. This fatality was well known to the Greeks during the Trojan war, and therefore Ulysses and Diomedes were commissioned to steal it away, which they effected, by, it is asserted, the assistance of Helenus the son of Priam, who proved in this unfaithful to his country. Minerva was displeased with the violence offered to her statue, and according to Virgil the Palladium itself appeared to have received life, and by the flashes from its eyes, and sudden springs from the earth, indicated the resentment of the goddess. Some affirm, that the true Palladium was not taken by Ulysses and Diomedes, but that Æneas carried it with him into Italy.

PALLADIUM, a metal obtained from the ore of platina. See **PLATINUM**.

PALLANTIDES, the fifty sons of Pallas, the brother of Ægeus. They were all killed by Theseus, the son of Ægeus, whom they opposed when he came to take possession of his father's kingdom.

PALLAS, a freed man of Claudius, famous for his power and riches. He advised the emperor to marry Agrippina, and to adopt her son Nero. It was by his means, and those of Agrippina, that the death of Claudius was hastened, and that Nero was raised to the throne. Nero afterwards discarded Pallas, and some time after caused him to be put to death, that he might make himself master of his great riches, A. D. 61.

PALLAS (*adis*), the same as Minerva. She received this name either because she killed the giant Pallas, or from the spear which she seems to brandish in her hands, (*παλλειν*). See **MINERVA**.

PALLAS (*antis*), a son of king Evander, sent with some troops to assist Æneas. He was killed by Turnus, the king of the Rutuli, after he had made a great slaughter of the enemy. (*Virgil*). One of the giants, son of Tartarus and Terra. He was killed by Minerva.

PALLASIA, in botany, a genus of the class syngenesia, order polygamia frustranea. Receptacle chaffy, downless; seeds vertical; flat, with a ciliate margin, calyx imbricate. Two species; Mexican plants.

PALLAVICINI (Anthony), a native of Genoa. His abilities recommended him to the pope, who employed him in several embassies, and made him bishop of Pampeluna, and a cardinal. He died 1507, aged 66.

PALLAVICINI (Ferrant), an eccentric Italian, born at Placentia. He assumed the habit of an Augustine friar; but instead of a regular life, he devoted himself to the amours of courtezans. Poor by his incontinence, he had recourse to his pen for support, and wrote his Courier robbed of his Mail, a periodical work, which for a while was read with avidity; but soon, from its satirical nature, was noticed by the inquisition. He avoided persecution by travelling into Germany; but upon his return to Venice he resumed his Courier, and in greater violence vented his satire even against

the pope. He was seized, but made his escape by means of one of his mistresses; and he might have avoided the impending storm, had not Morfu, a creature of the pope's nuncio, prevailed on him to go to France, in hopes of meeting encouragement from Richlieu. Pallavicini was caught in the snare; but instead of being conducted to Paris, he was brought to Avignon, where after some severe and inhuman treatment he was brought to trial and condemned to lose his head, which took place at Avignon, 1644. Morfu, who had been rewarded for his villainy, was afterwards murdered by one of Pallavicini's friends. He wrote some books of merit, printed at Venice, 4 vols. 12mo. 1655.

PALLAVICINI (Sforze), a cardinal, born at Rome, 1607. He entered among the jesuits, and taught philosophy and theology, and gained the respect of the world. He was made a cardinal, and died 1667, aged 60. He wrote an Italian treatise on style, and on dialogue—some letters—but his best known work is the History of the Council of Trent, in opposition to that of father Paul.

PALLENE, a small peninsula of Macedonia, formerly called Phlegra, situate above the bay of Thermæ on the Ægean sea, and containing five cities, the principal of which is called Pallene. It was in this place, according to some of the ancients, that an engagement happened between the gods and the giants.—2. A village of Attica, where Minerva had a temple, and where the Pallantides chiefly resided.

PA'LLET. *s.* (from *paille*, Fr. straw.) 1. A small bed; a mean bed (*Wotton*). 2. (*palette*, Fr.) A small measure of liquid, formerly used by chirurgeons (*Hakewill*).

PALLET, among painters. See **PALETTE**.

PALLET, in gilding, an instrument made of a squirrel's tail, to take up the gold leaves from the pillow, and to apply and extend them on the matter to be gilt. See **GILDING**.

PALLET, in heraldry, is nothing but a small pale consisting of one half of it in breadth, and therefore there are sometimes several of them upon one shield.

PALLET is also a part belonging to the balance of a watch or movement. See the article **WATCH**.

PALLIAMENT. *s.* (*pallium*, Lat.) A dress; a robe (*Shakspeare*).

PALLIARDISE. *s.* (*palliardise*, Fr.) Fornication; whoring; obsolete.

To PALLIATE. *v. a.* (*pallio*, Lat. *pallier*, Fr.) 1. To cover with excuse (*Swift*). 2. To extenuate; to soften by favourable representations (*Dryden*). 3. To cure imperfectly or temporarily, not radically; to ease, not cure.

PALLIATION. *s.* (*palliation*, French.) 1. Extenuation; alleviation; favourable representation (*King Charles*). 2. Imperfect or temporary, not radical cure; mitigation, not cure (*Bacon*).

PALLIATIVE. *a.* (*palliatif*, Fr.) 1. Extenuating; favourably representative. 2. Mitigating, not removing; temporarily, not radically curative (*Arbuthnot*).

PA'LLIATIVE. *s.* (from *palliate*.) Something mitigating (*Swift*).

PA'LLID. *a.* (*pallidus*, Latin.) Pale; not highly coloured; not bright (*Spenser*).

PALLIO COOPERIRE. It was an ancient custom, where children were born out of lawful wedlock, and their parents were afterwards married, that those children, together with the father and mother, should stand *pallio cooperti*, under a cloth, while the marriage was solemnizing; which was a kind of adoption, and had the effect of a legitimation. Thus Robert Grosthead, the famous bishop of Lincoln, in one of his letters, says: *In signum legitimations, nati ante matrimonium consueverunt puni sub pallio super parentes eorum extento, in matrimonii solemnizatione*. Selden, in his notes on Fleta, adds, that the children of John of Gaunt, duke of Lancaster, by Catharine Swinford, though legitimated by act of parliament, yet were covered with the pall when their parents were married.

PALLISER ISLANDS, a group of islands in the Pacific ocean; the largest about 15 miles long and 10 broad: Lon. 146. 30 W. Lat. 15. 38 S.

PALLIUM, in antiquity, an upper garment or mantle worn by the Greeks, as the toga was by the Romans. Each of these were so peculiar to the respective nations, that Palliatus is used to signify a Greek, and Togatus a Roman.

PALLMA'LL. *s.* (*pila*, and *malleus*, Latin; *pale maille*, French.) A play in which the ball is struck with a mallet through an iron ring.

PALM. *s.* (*palma*, Latin.) 1. A tree of great variety of species; of which the branches were worn in token of victory: it therefore implies superiority (*Miller*). 2. Victory; triumph (*Dryden*). 3. The inner part of the hand (*Bacon*). 4. A hand, or measure of length, comprising three inches (*Denham*).

To PALM. *v. a.* (from the noun.) 1. To conceal in the palm of the hand, as jugglers (*Prior*). 2. To impose by fraud (*Dryden*). 3. To handle (*Prior*). 4. To stroak with the hand (*Ainsworth*).

PALM TREE. See CHEMÆROPS.

PALM TREE (Dwarf). See CHEMÆROPS.

PALM (Cocoa-nut). See COCOS.

PALM (Frausal nut). See ARECA.

PALM (Mountain fan). See CORYPHA.

PALM SUNDAY, the Sunday next before Easter, being so called in memory of our Saviour's triumphant entry into Jerusalem, when the attending multitude strewed branches in his way.

PALM OIL. (*oleum palmæ*.) This oil is produced chiefly from the fruit of the *cocos butyracea inermis*, frondibus pennatis: foliolis simplicibus of Linnæus, by bruising and dissolving the kernels of the fruit in water, without the aid of heat, by which the oil is separated, and rises to the surface, and on being washed two or three times is rendered fit for use. When brought into this country it is of the consistence of an ointment, and of an orange yellow colour, with little taste, and of a

strong, though not disagreeable, smell. Its use is confined to external applications in pains, tumours, and sprains; but it appears to possess very little, if any, advantage over other bland oils. See OIL.

PALMA, one of the Canary islands, to the N. of Ferro, 50 miles in circumference, and very fertile. It has a town of the same name, much frequented for its excellent wines, and safe harbour. Lon. 17. 50 W. Lat. 28. 37 N.

PALMA, a town of Spain, in Andalusia, on the Xenil, near its conflux with the Guadalquivir, 30 miles S.W. of Cordova.

PALMA, or PALMA NUOVA, a strong frontier town of Italy, in Friuli, seated on a canal, which communicates with the Lizonzo, 10 miles S.E. of Udina, and 55 N.E. of Venice. Lon. 13. 15 E. Lat. 46. 2 N.

PALMA CHRISTI, in botany. See RICINUS.

PALMÆ, in botany, the sixth family; and the first of the nine great tribes, nations, or casts, into which Linnæus has divided all vegetables. They are placed in the appendix to the Artificial System, and take the lead in the natural orders, though Linnæus had placed them only in the second place, in his Fragments of a Natural Method.

PALMARIS BREVIS. (*palmaris*, from *palma*, the hand.) In myology, a small, thin, cutaneous flexor muscle of the hand, situated on the fore arm, between the wrist and the little finger. Fallopius tells us, that it was discovered by Cananus. Winslow names it *palmaris cutaneus*. It arises from a small part of the internal annular ligament, and inner edge of the aponeurosis *palmaris*, and is inserted by small bundles of fleshy fibres into the *os pisiforme*, and into the skin and fat that cover the abductor minimi digiti. This muscle seems to assist in contracting the palm of the hand.

PALMARIS CUTANEUS. See PALMARIS BREVIS.

PALMARIS LONGUS. *Ulnaris gracilis* of Winslow. A flexor muscle of the arm situated on the fore arm, immediately under the integuments. It arises tendinous from the inner condyle of the *os humeri*, but soon becomes fleshy, and after continuing so about three inches, terminates in a long slender tendon, which near the wrist separates into two portions, one of which is inserted into the internal annular ligament, and the other loses itself in a tendinous membrane, that is nearly of a triangular shape, and extends over the palm of the hand, from the carpal ligament to the roots of the fingers, and is called *aponeurosis palmaris*. Some of the fibres of this expansion adhere strongly to the metacarpal bones, and separate the muscles and tendons of each finger. Several anatomical writers have considered this aponeurosis as a production of the tendon of this muscle, but seemingly without reason, because we now and then find the latter wholly inserted into the carpal ligament, in which case it is perfectly distinct from the

aponeurosis in question; and, in some subjects, the palmaris longus is wanting, but the aponeurosis is always to be found. Rhodius indeed says that the latter is now and then deficient, but there is good reason to think that he was mistaken. This muscle bends the hand, and may assist in its pronation; it likewise serves to stretch the aponeurosis palmaris.

PALMAS, a river of Mexico, formed by the junction of the Nassas and Saucedas, in New Biscay, and thence flows E. about 200 miles, between the provinces of Panuco and New Leon, into the gulf of Mexico.

PALMAS, the capital of the island of Canaria. See CANARY.

PALMAS, one of the Philippine islands, 16 leagues S.E. of Mindanao. Lon. 127. 0 E. Lat. 5. 33 N.

PALMAS CAPE, a promontory on the Ivory coast of Guinea. Lon. 5. 34 W. Lat. 4. 26 N.

PALMATE, in ornithology, webbed, as the feet of some water-birds.

PALMATE ROOT, in botany, consisting of several oblong tubers or knobs, spreading out like the fingers. As in some sorts of orchis.

PALMATE LEAF. A hand-shaped leaf. Longitudinaliter in partes plures subæquales divisum versus basin, qua tamen coherens in unum. Philos. Bot.—Divisum ultra dimidium in lobo subæquales. Delin. Pl.—Divided beyond the middle into several lobes that are nearly equal: as in *passiflora cærulea*. It resembles the hand with the fingers spread; and is one of the simple leaves: whereas the digitate leaf resembles the fingers spread, without the hand; and, having all the leaflets separate, is one of the compound leaves.

PALMER. *s.* (from *palm*.) A pilgrim: they who returned from the Holy Land carried branches of palm.

PALMER, in angling. See FISHING FLIES.

PALMERWORM. *s.* (*palmer* and *worm*.) A worm covered with hair, a caterpillar.

PALMERSTON ISLE, an island in the Pacific ocean, discovered by Cook, in 1774. It consists of about ten islets, connected by a reef of coral rocks, and lying in a circular direction; the principal one not exceeding a mile in circumference, nor more than three feet above the level of the sea. It abounds with cocoa-nuts, scurvygrass, and the wharra-tree, but has no inhabitants. Lon. 162. 57 W. Lat. 18. 0 S.

PALMETTO, in botany. See CHEMÉOPROS.

PALMI FEROUS. *a.* (*palma* and *fero*, Lat.) Bearing palms.

PALMIPEDE. *a.* (*palma* and *pes*, Lat.) Webfooted (*Brown*).

PALMISTER. *s.* (from *palma*, Lat.) One who deals in palmistry.

PALMISTRY. *s.* (*palma*, Latin.) 1. The cheat of foretelling fortune by the lines of the palm (*Cleaveland*). 2. The action of the hand (*Addison*).

PALMY. *a.* (from *palm*.) Bearing palms.

PALMYRA, or TADMOR, once a magni-

ficent city of Syria, originally built by king Solomon, in the midst of a sandy desert, bounded on three sides by a chain of high mountains. On the decline of the Macedonian empire in the east it became the capital of a principality, under the name of Palmyra; and it declared for the Romans on Adrian marching his army through Syria to Egypt. The city flourished and increased to the time of Aurelian, when it resisted the Roman power under queen Zenobia, who held it out a long time, but was at length taken captive, and led in triumph through the streets of Rome. Soon afterward the inhabitants massacred the soldiers who had been left in garrison; which outrage occasioned the return of Aurelius, who, having made himself master of the place, caused all the inhabitants to be destroyed, and gave the pillage of the city to the soldiers. The stupendous ruins of this city were visited in 1751 by Mr. Wood, who published a splendid account of them in 1753. The inhabitants then consisted of about forty families, living in mud cottages, erected within the spacious court of a once magnificent temple. Palmyra is 100 miles S.E. of Aleppo. Lon. 38. 50 E. Lat. 33. 20 N.

PALMYRA ISLAND, an island in the South Sea, discovered by Capt. Sowle in the American ship Palmyra, November 10, 1802. This island is situated in latitude 5° 49' N. and in longitude 162° 23' W. from London; it is about three leagues in extent; there are two lagoons on it; in the westernmost of which is twenty fathom water, with a fine sandy bottom. It is very dangerous to approach the western part of the island, on account of the coral rocks which are just below the surface of the water, and extend to the distance of three or four leagues from the shore. The eastern part terminates in a steep reef of coral, over which the sea breaks with considerable force. On the north-west side there is good anchoring ground, about three quarters of a mile from the breakers, in eighteen fathom water on a coral bottom. There are no inhabitants on the island; nor was any fresh water found: but cocoa nuts, of very large size, are in great abundance; and fish of various kinds, and in large shoals, surrounded the land. A great quantity of drift-wood lay on the beach, which enabled those who landed to ascertain that the rise of the tide was about eighteen inches. (*Monthly Magazine*, Nov. 1804.)

PALNAUD, a district of Hindustan, belonging to the Carnatic, situate between the river Kistna, and to the W. of the Guntoor circar. Timerycotta is the principal place.

PALOS, a seaport of Spain, in Andalusia, with a tolerable harbour; celebrated for being the place whence Columbus sailed on his first adventurous voyage in 1492. It is seated at the mouth of the Tinto, 50 miles W. by S. of Seville. Lon. 6. 52 W. Lat. 37. 10 N.

PALPABILITY. *s.* (from *palpable*.) Quality of being perceivable to the touch (*Pope*).

PALPABLE. *a.* (*palpable*, French.) 1,

PAL

Perceptible by the touch (*Milton*). 2. Gross; coarse; easily detected (*Tillotson*). 3. Plain; easily perceptible (*Hooker*).

PALPABLENESS. *s.* (from *palpable*.) Quality of being palpable; plainness; grossness.

PALPABLY. *ad.* (from *palpable*.) 1. In such a manner as to be perceived by the touch. 2. Grossly; plainly (*Bacon*).

PALPATION. *s.* (*palpatio, palpor*, Lat.) The act of feeling.

To PALPITATE. *v. a.* (*palpito*, Latin.) To beat as the heart; to flutter.

PALPEBRÆ. (*palpebra*.) In anatomy. The eyelids, distinguished into upper and under: at each end they unite and form the canthus.

PALPEBRÆ SUPERIORIS LEVATOR. In myology. See **LEVATOR PALPEBRÆ SUPERIORIS**.

PALPEBRUM APERIENS RECTUS. See **LEVATOR PALPEBRÆ SUPERIORIS**.

PALPITATION. (*palpitatio*.) In medicine. Palpitation of the heart, which is either constant or frequently returning. A genus of disease in the class neuroses, and order spasmi of Cullen.

PALSGRAVE. *s.* (*paltsgraff*, German.) A count or earl who has the overseeing of a palace.

PALSICAL. *a.* (from *palsy*.) Afflicted with a palsy; paralytic.

PALSIED. *a.* (from *palsy*.) Diseased with a palsy (*Decay of Piety*).

PALSY. See **HEMIPLEGIA, PARAPLEGIA, PARALYSIS, &c.**

PALTE, a famous lake of Thibet, lying to the S. of Lassa, about three days journey, and 12 miles S. of the river Sanpoo or Burrampooter. It is 150 miles in circumference; and in the middle of it is one large island. On the W. shore of this island, or congeries of islands, is a monastery, and the seat of the Lamissa Turcepamo, or the Great Regenerate, in whom the Thibetians think that a divine spirit is regenerated, as it is in the Great Lama. The word Lama signifies a priest, and Lamissa is the feminine of Lama.

To PALTER. *v. n.* (from *paltron*, *Skinner*.) To shift; to dodge: not in use (*Shakspeare*).

To PALTER. *v. a.* To squander: as, he palters his fortune (*Ainsworth*).

PALTERER. *s.* (from *palter*.) An insincere dealer; a shifter.

PALTRINESS. *s.* (from *paltry*.) The state of being paltry.

PALTRY. *a.* (*poltron*, French, a scoundrel.) Sorry; worthless; despicable; contemptible; mean (*Addison*).

PALUS MEOTIS, the ancient name of a gulph between Europe and Asia, to the north of the Black Sea, now called the sea of Zabach, or Asoph.

PALY, or **PALE**, in heraldry, is when the shield is divided into four or more equal parts, by perpendicular lines falling from the top to the bottom.

PALY BEND, is when the escutcheon is

PAN

divided by perpendicular lines, which is paly; and also by diagonals, which is called bendy.

PAM, the knave of clubs.

PAMIERS, a town of France, in the department of Arriege, with a bishop's see. It is not so considerable as formerly, nor peopled in proportion to its extent. Near it is a mineral spring, said to cure the gout and obstructions. Pamiers is seated on the Arriege, eight miles N. of Foix, and 39 S. of Toulouse. Lon. 1. 32 E. Lat. 43. 8 N.

PAMLICO SOUND, a kind of inland sea of N. Carolina, 100 miles long and from 10 to 20 broad. It is separated, in its whole length, from the Atlantic, by a beach of sand, hardly a mile wide, generally covered by small trees or bushes. It has several inlets; but that of Ocrecock is the only one that will admit vessels of burden. This inlet is in lon. 76. 20 W. lat. 35. 10 N.

PAMPELONNE, a town of France, in the department of Tarn, 15 miles N. by E. of Alby. Lon. 2. 17 E. Lat. 44. 10 N.

PAMPELUNA, a town of Spain, capital of Upper Navarre, with a strong citadel, and a rich bishopric. Its squares are handsome, and adorned with shops full of rich merchandise. It is seated on the Arga, 42 miles S. of Bayonne, and 167 N.E. of Madrid. Lon. 1. 35 W. Lat. 42. 47 N.

PAMPELUNA, a town of New Granada, famous for its mines of gold, and numerous flocks of sheep. It is 150 miles N. by E. of St. Fé de Bagota. Lon. 71. 30 W. Lat. 6. 30 N.

To PAMPER. *v. a.* (*pamberare*, Italian.) To glut; to fill with food; to saginate (*Pope*).

PAMPHILUS, a celebrated painter of Macedonia, in the age of Philip. He was founder of the school for painting at Sicyon. Apelles was one of his pupils.

PAMPHYLIA, a province of Asia Minor, anciently called Mopsopia, and bounded on the south by a part of the Mediterranean, called the Pamphylian sea, west by Lycia, north by Pisidia, and east by Cilicia. It abounded with pastures, vines, and olives.

PAMPHLET. *s.* (*par un filet*, French.) A small book; properly a book sold unbound, and only stitched (*Clarendon*).

To PAMPHLET. *v. n.* (from the noun.) To write small books (*Howell*).

PAMPHLETEER. *s.* (from *pamphlet*.) A scribbler of small books (*Swift*).

To PAN. *v. a.* An old word denoting to close or join together (*Ainsworth*).

PAN. *s.* (*ponne*, Saxon.) 1. A vessel broad and shallow (*Spenser*). 2. The part of the lock of the gun that holds the powder (*Boyle*). 3. Any thing hollow: as, the brain *pan*.

PAN, in ancient mythology, was the god of shepherds, of huntsmen, and of all the inhabitants of the country. He was the son of Mercury, by Dryope, according to Homer. Different authors have given him different parents. Pan, however, was a monster in appearance; he had two small horns on his head, his complexion was ruddy, his nose flat, and his legs,

thighs, tail, and feet, were those of a goat. His education was entrusted to a nymph of Arcadia, called Sinoe, but the nurse, according to Homer, terrified at the monster, fled away and left him. He was wrapped up in the skins of beasts by his father, and carried to heaven, where Jupiter and the gods long entertained themselves with the oddity of his appearance. There Bacchus gave him the name of Pan. The god of shepherds chiefly resided in Arcadia, where the woods and the most rugged mountains were his habitation. He invented the flute with seven reeds, which he called *Syrinx*, in honour of a nymph of the same name who was changed into a reed. He was continually employed in deceiving the neighbouring nymphs, and captivated Diana, by transforming himself into a beautiful white goat. He was also enamoured of a nymph of the mountains called *Echo*, by whom he had a son called *Lynx*. He also paid his addresses to *Omphale*, queen of *Lydia*. The worship of Pan was well established, particularly in Arcadia, where he gave oracles on mount *Lycaeus*. His festivals, called by the Greeks *Lyceæ*, were brought to Italy by *Evander*, and they were well known at Rome by the name of the *Lupercalia*. (See *LUPERCALIA*.) The worship, and the different functions of Pan, are derived from the mythology of the ancient Egyptians. As Pan usually terrified the inhabitants of the neighbouring country, that kind of fear which often seizes men, and which is only imaginary, has received from him the name of *panic fear*.

PAN, or PAHANG, a town on the E. coast of the peninsula of Malacca. It is the capital of a kingdom of the same name, remarkable for the great number of elephants, and for the plenty of pepper it produces. Pan is 140 miles N.E. of Malacca. Lon. 103. 20 E. Lat. 3. 55 N.

PANACEA. (*panacea*, *πανακεια*; from *παν*, all, and *ακεωμαι*, to make well.) An epithet given by the ancients to those remedies which they conceived would cure every disease. Unfortunately for those of the present day, there are no such remedies.

Some derive the name from *Panacea*, a daughter of *Æsculapius* who presided over health.

PANADA. (*pane*, bread, Ital.). Bread boiled in water to a proper consistence for feeding children or infirm persons with.

PANÆTIUS, a stoic philosopher of Rhodes, 138 B. C. He studied at Athens for some time, thence he came to Rome, where he reckoned among his pupils *Lælius* and *Scipio*, the second Africanus. To the latter he was attached by the closest ties of friendship and familiarity: he attended him in his expeditions, and partook of all his pleasures and amusements. *Panætius* wrote a treatise on the duties of man, whose merit can be ascertained from the encomiums which *Cicero* bestows upon it.

PANAGIA, a town of Turkey in Europe,

in Romania, 14 miles N. of Gallipoli. Lon. 27. 2 E. Lat. 40. 40 N.

PANAMA, the capital of *Terra Firma* Proper, and the seat of a royal audience and of a bishop. It was built in 1517, and was sacked and burnt by the English buccaneers in 1670. Before the abolition of the trade by the galeons, in 1748, the Spaniards of *Chili* and *Peru*, in order to be supplied with the products and manufactures of Europe, were obliged to repair to *Porto Bello* or *Panama*; but, since that period, the commercial intercourse has been carried on by single vessels, called register ships, which sail round *Cape Horn*, and convey directly to the ports of *Chili* and *Peru* the merchandise which was formerly conveyed across the isthmus of *Darien* to *Panama*. In the harbour of *Panama* is a fine pearl fishery. This city is seated on a bay of the same name, 70 miles S. of *Porto Bello*. Lon. 80. 35 W. Lat. 8. 48 N.

PANARIA, one of the *Lipari* islands, in the Mediterranean, between *Lipari* and *Stromboli*. It is barren, and only five miles in circumference.

PANARIS. (*panaris*, corrupted from *paronychia*). See *PARONYCHIA*.

PANARMONION. (Greek.) A wind instrument used by the ancient Greeks, which (as far as we are able to collect from *Plato*, and the Commentaries of *Proclus* on that illustrious author), consisted of an assemblage of pipes, and resembled in some degree the modern organ. It is particularly worthy of notice, that every hole of these pipes, or imitation of pipes, as *Proclus* expressly calls them, was capable of emitting three different sounds, and in some circumstances more than three: from which we conclude that the ancients were better acquainted with the theory of natural harmonics than is generally supposed; several even of the moderns denying the possibility of the thing altogether. See *OCTAVE*.

PANATHENÆA, festivals in honour of *Minerva* the patroness of Athens, first instituted by *Erichtheus* or *Orpheus*, and called *Athenæa*; but *Theseus* afterwards renewed them, and caused them to be celebrated and observed by all the tribes of Athens, which he had united into one, and from which reason the festivals received their name. Some suppose that they are the same as the Roman *Quinquatria*, as they are often called by that name among the Latins. In the first years of the institution they were observed only during one day, but afterwards the time was prolonged, and the celebration was attended with greater pomp and solemnity. The festivals were two; the great *Panathenæa* or *μεγαλα*, observed every 5th year, and the lesser *Panathenæa*, *μικρα*, which were kept every 3d year, or rather annually. For a minute description of the manner of their celebration, the student is referred to *Lemprière's* larger dictionary, or *Potter's* Antiquities.

PANAX. *Ginseng*. In botany, a genus of the class polygamia, order diœcia. Herm.

umbel. Calyx five-toothed, superior; corol five-petalled; stamens five; styles two; berry two-seeded. Male: umbel. Calyx entire. Nine species; natives of America, China, and Australasia.

The cultivated species are as follows:

1. *P. quinquefolia*. Proper ginseng.
2. *P. trifolia*. Three-leaved panax.
3. *P. aculeata*. Prickly panax.

The first two sorts are increased by sewing the seeds on a hot-bed; the last by layers or cuttings.

Ginseng was formerly supposed to be confined to the mountains of Chinese Tartary: it is now, however, fully ascertained that the American panax quinquefolia is precisely the same.

The dried imported roots scarcely exceed the thickness of the little finger; are about three or four inches long, frequently forked, transversely wrinkled, of a horny texture, and both internally and externally of a yellowish-white colour. "To the taste it discovers a mucilaginous sweetness, approaching to that of liquorice, accompanied with some degree of bitterness, and a slight aromatic warmth, with little or no smell. It is far sweeter, and of a more grateful smell than the roots of fennel, to which it has by some been supposed similar; and it differs likewise remarkably from those roots in the nature and pharmacæutic properties of its active principles, the sweet matter of the ginseng being preserved entire in the watry as well as the spirituous extract; whereas that of fennel roots is destroyed or dissipated in the inspissation of the watry tincture. The slight aromatic impregnation of the ginseng is likewise, in good measure, retained in the watry extract, and perfectly in the spirituous."

By the Chinese it is regarded altogether as a panacea, or universal medicine: in Europe its medical virtues are regarded as trivial.

PANAY, one of the Philippine islands, between those of Paragoa and Negro. It is 250 miles in circumference, and the most populous and fertile of them all. It is watered by a great number of rivers and brooks, and produces a great quantity of rice. Iloila is the capital.

PANCAKE. *s.* (*pan* and *cake*.) Thin pudding baked in a fryingpan (*Mortimer*).

PANCARPUS, in Roman antiquity, a kind of show which the Roman emperors frequently exhibited to the people. The word is formed from the Greek *παν*, all, and *καρπος*, fruit. Whence the name was also given by the Athenians to a sacrifice wherein all kinds of fruits were offered. In this spectacle, the Circus, being all set over with large trees, represented a forest, into which the beasts being let from the dens under-ground, the people, at a sign given by the emperor, pursued, shot, and killed all they could lay hold of, which they afterwards carried away, to regale upon at home.

PANCRAS (St.), a village in Middlesex, now adjoining the N.W. of London. It has a church

dedicated to St. Pancras; and the churchyard is remarkable for having been the principal place of interment for the Roman catholics. At a public house near the church is a medicinal spring. Here is the Veterinary College, established in 1791, for the improvement of farriery, and the treatment of cattle in general.

PANCRATICAL. *a.* (*παν* and *κρατος*.) Excelling in all the gymnastic exercises (*Brown*).

PANCRATIUM (compounded of *παν*, all, and *κρατω*, I overcome), among the ancients, a kind of intermixed exercise, consisting of the lucra or wrestling, and the boxing or pugilate: but it differs in this, that as the athletes are not to seize the body, their hands are not armed with gauntlets, and give less dangerous blows. The pancratium was the third gymnastic exercise, and was not introduced till long after the others.

PANCRATIUM. Lily daffodil. Sea daffodil. In botany, a genus of the class hexandria, order monogynia. Corol superior, six-petalled; nectary campanulate, twelve-cleft; stamens placed on the nectary; stigma obtuse. Eleven species, natives of the West Indies or South America, a few of the south of Europe. Seven or eight of these are cultivated, the most of them as stove-plants.

PANCREAS. (*pancreas*, *πᾶνκρεας*; from *παν*, all, and *κρεας*, flesh; so called from its fleshy consistence.) A glandular viscus of the abdomen, of a long figure, compared to a dog's tongue, situated in the epigastric region under the stomach. It is composed of innumerable small glands, the excretory ducts of which unite and form one duct, called the pancreatic duct, which perforates the duodenum with the ductus communis choledochus, and conveys a fluid, in its nature similar to saliva, into the intestines. The pancreatic artery is a branch of the splenic. The veins evacuate themselves into the splenic vein. Its nerves are from the par vagum and great intercostal. The use of the pancreas is to secrete the pancreatic juice, which is to be mixed with the chyle in the duodenum. The quantity of the fluid secreted is uncertain; but it must be very considerable, if we compare it with the weight of the saliva, the pancreas being three times larger, and seated in a warmer place. It is expelled by the force of the circulating blood, and of the incumbent viscera in the full abdomen; as the liver, stomach, spleen, mesenteric and splenic arteries, and the aorta. Its great utility appears from its constancy, being found in almost all animals; nor is it refuted by the few experiments in which a part of it was cut out from a robust animal, without occasioning death; because the whole pancreas cannot be removed without the duodenum: for even a part of the lungs may be cut out without producing death, but they are not therefore useless. It seems principally to dilute the viscid cystic bile, to mitigate its acrimony, and to mix it with the food. Hence it is poured into a place remote from the cystic duct, as often as there is no gall-

bladder. Like the rest of the intestinal humours, it dilutes and resolves the mass of aliments, and performs every other office of the saliva.

PANCREATIC DUCT. See **DUCTUS PANCREATICUS.**

PANDANUS. Screw pine. In botany, a genus of the class diœcia, order monandria. Male: anthers sessile, inserted into the ramifications of the spadix. Female: stigmas two; fruit compound.

One species only, *P. odoratissimus*, sweet-scented screw pine: a native of Asia.—Branches issuing from large fusiform roots, descending to the ground and dividing; leaves clasping, imbricate in three spiral rows, spinous on the back and edges. It flowers in Asia during the rainy season, and is chiefly employed in making hedges. The perfume afforded by the tender white petals, of the male chiefly, afford the richest and most delightful fragrance of the vegetable world.

As a stove plant, it has a fine ornamental effect in our own country from its large spreading foliage. It may be best propagated by seeds sown in light earth in pots plunged into a tan-bed.

PANDARUS, a son of Læon, is remarkable for having broken the truce which had been agreed upon between the Greeks and Trojans. He also wounded Menelaus and Medes, and shewed himself uncommonly courageous. He was at last killed by Diomedes; and Æneas, who then carried him in his chariot, by attempting to revenge his death, nearly perished by the hand of the furious enemy.—2. A son of Alcanor, killed with his brother Bitias by Turnus.—3. A native of Crete, punished with death for being accessory to the theft of Tantalus. What this theft was is unknown. Some, however, suppose that Tantalus stole the ambrosia and the nectar from the tables of the gods, to which he had been admitted, or that he carried away a dog which watched Jupiter's temple in Crete, in which crime Pandarus was concerned, and for which he suffered. Pandarus had two daughters. See **CAMIRO** and **CLYTIA**.

PANDECTS, PANDECTÆ, in jurisprudence, the digest or collection, made by Justinian's order, of 534 decisions or judgments of the ancient lawyers, on so many questions occurring in the civil law; to which that emperor gave the force and authority of law, by the epistle prefixed to them. The word is Greek, *πανδεκται*, compounded of *πας*, all, and *δεχομαι*, *capio*, I take; i. e. a compilation, or a book containing all things. Though others, as Bartoli, will have it formed from *πας*, all, and *δεχομαι*; as if these books contained the whole doctrine of the law. The pandects consist of 50 books, and make the first part of the body of the civil law. They were denoted by two π; but the copyists taking those π for ff, the custom arose of quoting them by ff.

In the year 1137, the Pandects of Justinian, which had been brought by an Amalitan merchant from the East, fell into the hands of the

Pisans. Angelus Politianus believes this copy to be that which had been compiled by order of the emperor. However that be, it is certain that all other copies are taken from it, as being the most ancient. The Pisans having obtained their request from the emperor, carried the volumes to Pisa, and for near three centuries they were known by the name of the Pandectæ Pisanae.

PANDEMIC. (*pandemicus*; from *πας*, all, and *δemos*, the people). A synonym of epidemic. See **EPIDEMIC**.

PA'NDER. s. (from *pandanus*, the pimp in the story of *Troilus* and *Cressida*.) A pimp; a male bawd; a procurer (*Dryden*).

To PA'NDER. v. a. (from the noun.) To pimp; to be subservient to lust or passion (*Shakspeare*).

PANDERLY. a. (from *pander*.) Pimping; pimplike (*Shakspeare*).

PANDICULATION. s. (*pandiculans*, Latin.) The restlessness, stretching, and uneasiness that usually accompany the cold fits of an intermitting fever (*Floyer*).

PANDION, a king of Athens, son of Erichthon and Pasithea, who succeeded his father, B. C. 1437. He became father of Procne and Philomela, Erechtheus and Butes. During his reign there was such abundance of corn, wine and oil, that it was publicly reported that Bacchus and Minerva had personally visited Attica. He gave his daughter Procne in marriage to Tereus, king of Thrace, who had assisted him in a war with the Boeotians. The treatment which Philomela received from Tereus (see **PHILOMELA**) was the source of infinite grief to Pandion, and he died after a reign of 40 years.—There was also another Pandion, son of Cecrops 2d, who succeeded his father, B. C. 130. He was driven from his paternal dominions and fled to Pylas, king of Megara, who gave him his daughter Pelia in marriage, and resigned his crown to him. Pandion had four children. Ægeus, the eldest, afterwards recovered his father's kingdom. Some authors have confounded the two Pandions, and made Philomela and Procne the daughters, not of Pandion the 1st, but of Pandion the 2d. (*Ovid*, *Apollod.*, *Paus*).

PANDORA, the first mortal female that ever lived, according to Hesiod. She was made of clay by Vulcan, at the request of Jupiter, who wished to punish the impiety of Prometheus, by giving him a wife. When this woman of clay had received life, all the gods vied in making her presents. Venus gave her beauty, the Graces the power of captivating, Apollo taught her music, Mercury instructed her in eloquence, and Minerva gave her the most splendid ornaments.—From these presents received from the gods the woman was called Pandora, which intimates that she had received every necessary gift, *πας δωρον*. Jupiter after this gave her a box to present to the man who married her, and Mercury then conducted her to Prometheus. The artful mortal, sensible of the deceit, would not suffer

himself to be captivated by her charms. His brother Epimetheus was not possessed of the same prudence. He married Pandora, and upon opening the box which she presented him, there issued from it a multitude of evils, which dispersed themselves over the world, and which continue to afflict the human race. Hope only remained at the bottom, which alone renders troubles and sorrows less painful in life.

PANDORON, an ancient stringed instrument resembling a lute, and the strings of which are of brass. Its frets are of copper, like those of the cistrum; its back is like that of a guitar; and the rims of its table, like those of its ribs, are cut into semicircles.

PANDROSOS, a daughter of Cecrops, king of Athens, sister to Aglauros and Herse. She was the only one of the sisters who had not the fatal curiosity to open a basket, in which was Erichthonius, and which Minerva had entrusted to their care: for which sincerity a temple was raised to her, near that of Minerva, and a festival instituted in her honour, called Pandrosia.

PANDURATE LEAF. PANDURA FORM LEAF. In botany. (Pandura, a musical instrument of the guitar kind, in Mersennus) folium. A guitar-shaped leaf. (Viol-shaped, Ray hist. 174.) The French call it *en forme de violon*.—Oblongum, inferne latius, lateribus, coarctatum. Philos. Bot. Oblong, broader, below, contracted on the sides. In Delin. Pl. the explanation is differently worded. Oblongum, lateribus: oblongum, lateribus inferne coarctatum. Oblong, contracted below at the sides. The former appears most correct. It is exemplified in *rumex pulcher*, and *convolvulus panduratus*.

PANE. *s.* (*paneau*, French.) 1. A square of glass (Pope). 2. A piece mixed in variegated works with other pieces (Donne).

PANEGYRIC, an oration in praise of some extraordinary thing, person, or virtue. The name is Greek, *πανηγυρις*; formed of *παν*, all, and *αγυρις*, I assemble; because anciently held in public and solemn assemblies of the Greeks, either at their games, their feasts, fairs, or religious meetings. To make their panegyrics the more solemn, the Greeks used to begin with the praises of the deity in whose honour the games, &c. were celebrated; then they descended to the praise of the people or country where they were celebrated; then to the princes or magistrates who presided at them; and at length to the champions, especially the conquerors, who had gained the prizes in them.

PANEGYRICAL. *a.* 1. Dealing in panegyrics. 2. Communicating or exhibiting panegyrics; laudatory.

PANEGYRIST. *s.* (*panegyriste*, Fr.) One that writes praise; encomiast (Camden).

PAN'EL. *s.* (*panellum*, Lat. *paneau*, Fr.) 1. A square, or piece of any matter inserted between other bodies (Addison). 2. A schedule or roll, containing the names of such jurors,

as the sheriff provides to pass upon a trial (Cowell).

PANG. *s.* (*bang*, Dutch, uneasy.) Extreme pain; sudden paroxysm of torment (Derham).

To PANG. *v. a.* (from the noun.) To torment cruelly (Shakspeare).

PANGÆUS, in ancient geography, a mountain of Thrace, anciently called Mons Caraminus, and joined to Mount Rhodope, near the sources of the river Nestus. On this mountain Lycurgus, the Thracian king, was torn to pieces, and Orpheus called the attention of the wild beasts and of the mountains and woods to listen to his song.

PANGOLIN, a species of **MANIS**, which see.

PANJAB, a country of Hindustan Proper, being that watered by the five eastern branches of the Indus. It was the scene of Alexander's last campaign, and the termination of his conquests. It forms a square of 250 miles, and includes the whole of Lahore, and a great part of Moultan Proper. To the lower part of Moultan it is flat and marshy, and inundated by the periodical rains which fall between May and October.

PAN'IC. *s.* Ill grounded terror or fright. See **PAN**.

PANICLE. In botany. (From *panica*, *πανικα*, coma; or rather from *panus*, the wool about the quill in the shuttle.) Fructification sparsa in pedunculis diverse subdivis. A fructification, or species of inflorescence, in which the flowers or fruits are scattered on peduncles variously subdivided. As in oats and some of the grasses.

PANICLE (Heaped). Having great abundance of flowers.

PANICLE (Dense or close). A higher degree of the preceding. Or rather, having the flowers close as well as abundant.

PANICLE (Spiked). Approaching in form to a spike: as in several of the grasses, which are commonly called spiked grasses.

PANICLE (Contracted). A greater degree of the foregoing.

PANICLE (Coarctate). A squeezed panicle. Having the pedicels extremely near to each other.

PANICLE (Patent). A spreading panicle. Having the pedicels spreading out so as to form an acute angle with the stalk.

PANICLE (Diffuse). A diffused panicle. Having the pedicels spreading out more and irregularly.

PANICLE (Divaricate). A divaricating panicle. Spreading out still more, at an obtuse angle with the stalk.

PANICULATE LEAF. A panicked stem. Having branches variously subdivided.

PANICULATE GRASSES. Panicked grasses. Having their fructifications in a panicle.

PANICUM. Panic grass. In botany, a genus of the class triandria, order digynia. Calyx three-valved, one-flowered; the third valve very small; seed invested with the permanent hardened corol. Eighty-two species scattered

over the globe; of which four are common to our own corn-fields: of these some are spiked, and others panicked.

Those common to our own fields are as follows:

1. *P. verticillatum*, with whorled spike and diffuse culms. Corn-fields.

2. *P. crus galli*: spike doubly-compound; glume awned, hispid. Wet fields. There is a variety with the awns ten times as long as the glumes.

3. *P. sanguinale*. Finger-like spikes; sheaths of the leaves dotted. Corn-fields.

4. *P. dactylon*. Finger-like spikes; and creeping shoots. Sandy shores.

The two following are also worth particularising:

5. *P. Italicum*. Spike compound; culm simple; leaves alternate, flat, striate, reflected. It is from this plant the Italians obtain their millet seed; whence its specific name; for it is a native of the Indies.

6. *P. miliaceum*. Millet panicum. Panicle loose, flaccid; leaves with hairy or glabrous sheaths; glumes mucronate, nerved; culm channelled, branched, leafy. The seeds are the common millet seeds of our own shops. The plant is indigenous to India.

PANKE. In botany, a genus of the class enneandria, order monogynia. Calyx four-cleft; corol campanulate, four-cleft; capsule two-valved, one-seeded. Two species, natives of Chili.

PANNADE. See **CURVET**.

PANNANACH WELLS, a village in Aberdeenshire, situate a little below the waterfall, called the Lin of Dee, in the valley of Glenmuick. It is noted for its mineral waters; and has a lodge for the accommodation of the company that frequent this place in summer.

PANNELS OF A SADDLE, two cushions, or bolsters, filled with cow, deer, or horse-hair, and placed under the saddle, one on each side, so as to touch the horse's body, and prevent the bows from galling or hurting his back.

PANNICLE. (*panniculus*, dimin. from *pannus*, a woven cloth) *Panniculus carnosus*; carnosous membrane, a thin muscular covering attached to the skin in brute animals, by means of which they have the power of shaking it so as to throw off any thing which adheres to the hairy coat and occasions uneasiness. Gibson's account of this superficial muscle is given under the article **CUTIS**. The fatty panicle is synonymous with **CELLULAR MEMBRANE**, which see.

PANNIER *s.* (*panier*, French.) A basket; a wicker vessel, in which fruit, or other things, are carried on a horse (*Addison*).

PANNIPUT, a town of Hindustan Proper, situate in an extensive plain between the cities of Delhi and Sirhind.

This plain is celebrated for a battle, in 1761, between an army of 200,000 Mahrattas, and Abdallah, sultan of Candahar, at the head of 150,000 Mahometans, in which the former were totally defeated. Panniput is 72 miles

N.W. of Delhi. Lon. 76. 45 E. Lat. 29. 15 N.

PANNONIA, a large country of Europe, bounded on the east by Upper Mœsia, south by Dalmatia, west by Noricum, and north by the Danube. It was first invaded by J. Cæsar, and conquered in the reign of Tiberius. Philip and his son Alexander some ages before had successively conquered it. Its chief city was Sirmium.

PANOMPHEUS, a surname of Jupiter, either because he was worshipped by every nation, or because he heard the prayers addressed to him, or because the rest of the gods derived from him their knowledge of futurity. (*πανς, omnis, ομης, vox.*)

PANOPE, or **PANOPEA**, one of the Nereides, whom sailors generally invoked in storms. Her name signifies giving every assistance, or seeing every thing.

PANOPHOBIA. (*panophobia, παναφοβια*; from *παν*, all, and *φοβος*, fear.) That kind of melancholy which is attended with groundless fears. The moderns consider it as symptomatic.

PANOPLY. *s.* (*πανοπλια*.) Complete armour (*Milton*).

PANOPODIS, the city of Pan, a town of Egypt, called also Chinmis. Pan had there a temple, where he was worshipped with great solemnity.

PANORAMA (from *παν*, all, and *οραμα*, a sight, of *ωραμαι*, perf. pass. of *οραω*, to see), in the art of painting, a representation of a town, a country, or any interesting scenery, upon the concave surface of a hollow cylinder. This ingenious extension of the art of painting, by means of which the spectator is thrown in the centre of the scene (a thing the possibility of which has been denied by many artists not thirty years ago), is the invention of the late Mr. Barker; whose panoramical pictures of Spithead, Edinburgh, Gibraltar, &c. have deservedly excited great admiration, and been warmly patronized. The son of the inventor still continues, with great zeal and talent, to exhibit to the public fresh pictures of this kind every season in Leicester square.

PANORMO, a town of Turkey in Europe, in Albania, situate on a gulf of the Adriatic, opposite the island of Corfu, 45 miles S.S.E. of Valona. Lon. 20. 2 E. Lat. 40. 0 N.

PANORPA, in zoology, a genus of the class insecta, order neuroptera. Mouth lengthened into a cylindrical, horny proboscis; feelers four, nearly equal; stemmata three; antennae filiform, longer than the thorax; tail of the male armed with a chelate appendage; of the female unarmed. Nine species, scattered over the globe; of which *P. communis* is the only one indigenous to our own country: its wings are of equal length, spotted with black, and transparent; body longish: it is frequently seen in our meadows during the early part of summer. *P. coa*, with erect wings, the lower ones nearly linear and very long, is a native of the Greek islands. It is larger than the preceding, and its wings are also beautifully spotted, or banded with brown and yellow.

PANSIE, or PANSY, in botany. See VIOLA.

To PANT. *v. n.* (*panter*, old Fr.) 1. To palpitate; to beat as the heart in sudden terror, or after hard labour (*Crashaw*). 2. To have the breast heaving, as for want of breath (*Dryden*). 3. To play with intermission (*Pope*). 4. To long; to wish earnestly (*Pope*).

PANT. *s.* (from the verb.) Palpitation; motion of the heart (*Shakspeare*).

PANTALARIA, an island in the Mediterranean, between Sicily and the coast of Tunis, 17 miles in circumference. It abounds in cotton, fruits, and wine, and is subject to the king of Naples. Lon. 12. 31 E. Lat. 36. 55 N.

PANTÆNUS, a stoic philosopher, born in Sicily (though some have erroneously supposed him to be a Hebrew) about the beginning of the reign of Commodus. He presided over the celebrated school of Alexandria, where, from the time of St. Mark, the founder of that church, they had always a divine that was eminent for his learning and piety to explain the holy scriptures, and to instruct them in human learning. This employment he was obliged to leave; for, when the Indians required of Demetrius, bishop of Alexandria to send them one to instruct them in Christianity, he sent Pantænus, who undertook the mission with joy, and behaved himself very properly in it. We are told, that the Indians had been tinctured with Christianity by St. Bartholomew the apostle; and that Pantænus met with the Hebrew original of St. Matthew's gospel, which the apostle had left there. St. Jerome says that Pantænus brought it with him; and that it was, in his time, preserved in the library of Alexandria. But we suspect St. Jerome to be mistaken in this respect. When Pantænus returned to Alexandria he reassumed the government of the school of that city, which, it is probable, he had, during his absence, committed to the care of St. Clement, a presbyter of Alexandria. He explained the scriptures publicly under the reign of Severus and Antoninus Caracalla; and was, in St. Jerome's opinion, more serviceable to the church by his discourses than by his writings. He published some commentaries upon the Bible, which are lost.

PANTALOON, a sort of garment consisting of breeches and stockings all of one piece; said to have been first introduced by the Venetians.

PANTALOON, on the theatre, is a buffoon or masked person, who performs high and grotesque dances, and shows violent and extravagant postures and airs. The word is likewise used for the habit or dress these buffoons usually wear; which is made precisely to the form of their body, and all of a piece from head to foot. And hence those who wear a habit of this kind, for conveniency under their other clothes, are called pantaloons of Venice.

PANTHEA, the wife of Abradates, cele-

brated for her beauty and conjugal affection. She was taken prisoner by Cyrus, who refused to visit her, not to be ensnared by the power of her personal charms. She killed herself on the body of her husband, who had been slain in a battle. (Vid. ABRADATES.)

PANTHEA, in antiquity, were single statues, composed of the figures, or symbols, of several different divinities together. Father Joubert, who calls them panthea, and who has remarked them sometimes on medals, says their heads are most commonly adorned with the symbols or attributes belonging to several gods.

PANTHEISM, a philosophical species of idolatry leading to atheism, in which the universe was considered as the supreme God. Who was the inventor of this absurd system is, perhaps, not known; but it was of early origin, and differently modified by different philosophers. Some held the universe to be one immense animal, of which the incorporeal soul was properly their God, and the heavens and earth the body of that God; whilst others held but one substance, partly active and partly passive: and therefore looked upon the visible universe as the only Numen. The earliest Grecian Pantheist of whom we read was Orpheus, who called the world the body of God, and its several parts his members, making the whole universe one divine animal. According to Cudworth, Orpheus and his followers believed in the immaterial soul of the world; therein agreeing with Aristotle, who certainly held that God and matter are coeternal; and that there is some such union between them as subsists between the souls and bodies of men. (See METAPHYSICS.) In the ancient Orphic theology, we are taught that this universe, and all things belonging to it, were made within God; that all things are contained together in the womb of God; that God is the head and middle of all things; that he is the basis of the earth and heaven; that he is the depth of the sea, the air we breathe, the force of the untameable fire; that he is the sun, moon, and stars; that there is one divine body; for, *Πάντα γὰρ ἐν μὲν γὰρ ταῖς ἀνθρώποις κεῖται*, "all these things lie in the great body of God."—But further, to prove that the most ancient Greek philosophers resolved all things into God, and made God all, we shall cite a most remarkable passage from Plutarch's Defect of Oracles. "Whereas there are two causes of all generations, the divine and the human, the most ancient theologers and poets attended only to the more excellent of these two; resolving all things into God, and pronouncing this of them universally; *Ζεὺς ἀρχὴ, Ζεὺς μέσος, Διὸς δ' ἐν παντί περὶ πάντα*, that God is both the beginning and middle, and that all things are out of God; insomuch, that they had no regard at all to the other natural and necessary causes of things; but on the contrary, their juniors, who were called naturalists, deviating from this most excellent and divine principle, placed in all bodies their passions, collisions, mutations, and commixtures." See SPINOZISM.

PANTHEON (Πανθεον, thus named from *παν*, all, and *θεος*, God), in architecture, a temple, or church, of a circular form; dedicated to all the gods, or to all the saints.

The Pantheon of ancient Rome is of all others the most celebrated, and that whence all the rest take their names. It was built by Agrippa, son-in-law of Augustus, in his third consulate, twenty-five years before Christ; though several antiquarians and artists have supposed that the Pantheon existed as long ago as the commonwealth, and that Agrippa only embellished it and added the portico. To this purpose they allege the authority of Dion Cassius, who, speaking of Agrippa, says, he also finished or perfected the Pantheon.

It was dedicated by him to Jupiter Uitor, Jupiter the Revenger; and had the name Pantheon, on account of the great number of statues of the gods ranged in seven niches all round it; and because built of a circular form, to represent heaven, the residence of the gods. It has but one door, and one window, receiving all its light from the top of its dome. It is one hundred and forty-four feet diameter within, and just as much in height, and of the Corinthian order. Before each niche are two columns of antique yellow marble fluted, and of one entire block. The whole wall of the temple, as high as the grand cornice inclusive, is eased with divers sorts of precious marble in compartments: and the frieze is entirely of porphyry.

The eruption of Vesuvius, in the reign of Tiberius, damaged the Pantheon very considerably: but it was successively repaired by Domitian, Adrian, and Septimius Severus: and it subsisted in all its grandeur till the incursion of Alaric, in the time of Honorius: on this occasion it was stripped of several of its statues and ornaments of gold and silver. About thirty-nine years after this, Genseric, king of the Vandals, took away part of its marbles and statues: at length pope Boniface IV. obtaining this Pantheon of the emperor Phocas, converted it into a church, without any alteration in the building; and dedicated it to the Virgin, and all the martyrs. And it still subsists at Rome under the title of *Noire Dame de la Rotonda*. However in 655, Constantius II. stripped it of its inside and outside brazen coverings, which he transported to Syracuse.

There was also at Rome another Pantheon, dedicated to Minerva, as the goddess of Medicine. It was in the form of a decagon, and the distance from one angle to another measured 22½ feet. Between the angles there were nine chapels of a round figure, designed for so many deities; and over the gate there was a statue of Minerva. The Pantheon of Athens was in many respects little inferior to that of Rome, built by Agrippa. The Greek Christians converted it into a church, dedicated to the Virgin, under the name of Panegia. The Turks changed it into a mosque.

The Pantheon of Nismes was a temple in that city, wherein were twelve niches, or sta-

tues, supposed to have been destined for the twelve great gods.

In the Escorial is a magnificent chapel, called Pantheon, thirty-five feet in diameter, and thirty-eight high, from the pavement, which is of marble and jasper inlaid. The whole inside of the chapel is of black marble, except the luthern, and some ornaments of jasper, and red marble.

In this chapel are deposited the bodies of the kings and queens: there are only places made for twenty-six: eight of which are already filled.

PANTHEUS, or **PANTHUS**, a Trojan, son of Othryas, the priest of Apollo. When his country was burnt by the Greeks, he followed the fortune of Æneas, and was killed.

PANTHER, in mastiology. See **FELIS**.

PANTILE, *s.* a gutter tile.

PANTINGLY, *ad.* (from *panting*.) With palpitation (*Shakspeare*).

PANTLER, *s.* (*panetier*, Fr.) The officer in a great family, who keeps the bread (*Shak.*).

PANTOFLE, *s.* (*pantoufle*, French.) A slipper (*Peacham*).

PANTOLOGIA, **PANTOLOGY**, (from *παν*, *παντος*, every thing, and *λογος*, treatise or instruction.) A work of universal instruction, or science: a cyclopædia or encyclopædia.

PANTOMIME, *παντομιμος*, among the ancients, a person who could imitate all kinds of actions and characters by signs and gestures without speaking. The pantomimes made a part in the theatrical entertainments of the ancients; their chief employment was to express, in gestures and action, whatever the chorus sung, changing their countenance and behaviour as the subject of the song varied. They were very ancient in Greece, being derived from the heroic times, according to some; but however this may be, they were certainly known in Plato's time. In Rome it was so late as the time of Augustus before they made their appearance. As to their dress, it was various, being always suited as near as possible to that of the person they were to imitate. The crocata was much used among the Roman pantomimes, in which and other female dresses they personated women.

We have this account of them in Gibbon's history. "The pantomimes, who maintained their reputation from the age of Augustus to the sixth century, expressed, without the use of words, the various fables of the gods and heroes of antiquity; and the perfection of their art, which sometimes disarmed the gravity of the philosopher, always excited the applause and wonder of the people. The vast and magnificent theatres of Rome were filled by 3000 female dancers, and by 3000 singers, with the masters of the respective chorusses. Such was the popular favour which they enjoyed, that in a time of scarcity, when all strangers were banished from the city, the merit of contributing to the public pleasures exempted them from a law which was strictly executed against the professors of the liberal arts."

Pantomimes are still very common in England: they differ indeed in some respects from those of antiquity; but they retain the name, and like these they consist in the representations of things merely by gestures.

PANTON-SHOE, or **PANTABLE-SHOE**, in farriery, an old invention, contrived for receiving narrow and hoof-bound heels. Its sponges are much thicker on the inside than on the outside, so that the part which rests upon the horn, or hoof, runs sloping to the end, that the thickness of the inside of the shoe may bear up the heel, and throw or push it to the outside. Panton-shoes are described by Guillet to be proper for horses that have false quarters.

PANTRY. *s.* (*paneterie*, Fr.) The room in which provisions are repositied.

PANUCO, a province of New Spain, in the audience of Mexico. The capital, of the same name, is a bishop's see, and is situated on the river Panuco, 170 miles N. by E. of the city of Mexico. Lon. 98. 5 E. Lat. 23. 0 N.

PANZERA. In botany, a genus of the class decandria, order monogynia. Calyx one-leaved, with a four-parted border; petal one, roundish, lateral, convolute at the base; filaments thickened and bearded at the base, five of them barren; legume doubtful. A Guiana tree, sixty feet high.

PAOLI (Pascal), a very celebrated Corsican, was born in 1726, being the son of Giocinto Paoli, a man of considerable weight and influence in that island, previously to the year 1735. Soon after that period the various revolutions his country underwent obliged him to withdraw to Naples; whence in the year 1755 he sent his son Pascal Paoli to assist his countrymen in regaining their liberty. Pascal had no sooner arrived than he was made, though but 29 years old, commandant-general of the island. He established a regular administration among the undisciplined Corsicans, and formed a considerable body of regular troops. He instituted an university, with the view of softening the manners, by cultivating the sciences. Pascal supported the Corsicans for some time against the gold of the Genoese, and the arms of France; but at length the latter prevailed, and Pascal was compelled to retire to England, where he arrived in 1769, and took up his abode in the capital.

A striking display of the character of the legislator and of the subject is given in the following anecdote, related by Paoli to Mr. Boswell, when he visited Corsica: "A criminal," said he, "was condemned to die. His nephew came to me with a lady of distinction, that she might solicit his pardon. The nephew's anxiety made him think that the lady did not speak with sufficient force and earnestness. He therefore advanced, and addressed himself to me, 'Sir, is it proper for me to speak?' as if he felt that it was unlawful to make such an application. I bid him go on. 'Sir,' said he, with the deepest concern, 'may I beg the life of my uncle? If it is granted, his relations will make a gift to the state of a thousand zechins.

We will furnish fifty soldiers in pay during the siege of Furiani. We will agree that my uncle shall be banished, and will engage that he shall never return to the island. I knew the nephew to be a man of worth, and I answered him: You are acquainted with the circumstances of this case. Such is my confidence in you, that if you will say that giving your uncle a pardon would be just, useful, or honourable for Corsica, I promise you it shall be granted. He turned about, burst into tears, and left me, saying, 'Non vorrei vendere l'onore della patria per mille zechini. I would not have the honour of our country sold for a thousand zechins.' And his uncle suffered." *Boswell's Corsica*, page 312.

After a residence of twenty years in England, during which his country continued under the sovereignty and dominion of France, new prospects of patriotic utility opened to the exiled chief, and invited him once more to authority and command. The extraordinary revolution which had begun in France, and had, in a short period, changed the whole system of its government and policy, extended its influence to its remotest territories, and rekindled the embers of liberty in Corsica. The simple circumstance of a Frenchman appearing at Bastia in the year 1789, with the national cockade in his hat, revived in the breasts of the Corsicans the almost extinguished spark, which was instantly fanned into a blaze in every part of the country, and wrought a complete revolution, without the expence of one drop of human blood. Immediately after this, the national convention passed a decree, in which the island was recognized as a department of France, and therefore entitled to its privileges; and they proceeded to reorganise its government upon the principles of the French constitution. The restoration of Paoli was regarded as an indispensable part of the measures to be adopted, and an application to this effect was directed to him, both from the National Convention and his countrymen. How great soever his satisfaction might have been to behold the prospect of emancipation and liberty which opened to his long-oppressed country, he hesitated to return. He considered it as still forming a part of France, and he could but ill reconcile his great mind to resume his station at the head of its affairs, while his government was to be subject to the control of a foreign power. But the earnest intreaties of his grateful countrymen, from whose hearts the interval of twenty years could not obliterate their deep sense of their obligations to his wisdom and valour, supported by the warm solicitations of the French assembly, finally prevailed. He resigned his pension, with feelings and acknowledgments to the generous people from whom he had enjoyed it, which reflected the highest honour upon the breast where every virtue seemed to be concentrated, and embarked once more for his native shores. On the 23d of April 1790, attended by deputies from Corsica, he presented himself at the bar of the national assembly at Paris. He was greeted on his entrance by

PAOLI.

shouts of rapturous applause: such was the enthusiasm communicated by the appearance of the great advocate of freedom to the breasts of those who were themselves but newly liberated from the shackles of oppression. The patriotic chief addressed the assembly with dignified composure, and impressive eloquence, in a speech expressive of the happiness he felt, after twenty years of exile from his country, to behold it once more about to be restored to the enjoyment of the sacred privileges of freedom, and of his readiness cheerfully to co-operate with the ruling powers of France, to render that enjoyment solid and permanently advantageous to his fellow citizens. Paoli now took the necessary oaths as a subject of the republic, and hastened to take upon himself the high and honourable charge to which he was called not only by Corsica and France, but by the unanimous voice of all Europe.

Hardly had he received the gratulations of his country on his return, and entered upon the duties of his new trust, before he found the whole of his prospects darkened and interrupted by the changes which were daily taking place in France, by the alternate ascendancy of different factions, and ultimately by the condemnation and execution of the king. The struggles of contending parties which at this time convulsed the whole of France considerably affected public opinion in Corsica. In some of the pieves, or departments, the violence of party spirit broke out into open tumult, and it was soon discovered that there was a disposition in a very great part of the inhabitants to avail themselves of the unsettled state of politics in the mother country to break their connection with it, and to shake off the yoke by which they were subjugated. To this party Paoli, after seriously considering the precarious condition of the island and of his government while subjected to a country which was itself the theatre of constant disorder, and the prey of turbulent factions, gave his powerful and commanding sanction. He was on this occasion joined by all the clergy of the country, who formed themselves into a military corps under the denomination of the sacred band. There was at this time a considerable body of French troops stationed in the different garrisoned towns. Finding that Paoli was taking measures to break from his allegiance, and being joined and instigated by some Corsican families who were at enmity with him, they formally took the field against him; but the force which he had been able to collect by the popularity of his cause and the universal attachment to his person was so great, that he was not long in deciding the contest and vanquishing his adversaries. He was then invested with his original dignities of president of the consulta, and commander in chief of the island, dignities which he had held with the highest honour before his country had become a province of France. The national assembly were greatly enraged at this counter-revolution, and alienation of Corsica from its sovereignty and dominion: they denounced Paoli to be a rebel,

set a price upon his head, passed a decree to cashier the consulta or national council, which he had re-established, and annulled, at least in words, which was all they had the power to effect, the authority which had been confided to him. Paoli was, however, too much beloved by his countrymen to be betrayed by them, and they were likewise little disposed to attend to the mandates or tremble at the denunciation of a government too distracted and impotent to do them immediate injury. Paoli saw nevertheless that it would not be possible to resist with success the power of France when once seriously directed to reduce the island to subjection; and well knew that a voluntary submission would not be received without being attended with fatal consequences to many individuals who had been instrumental in effecting its independence; he therefore resolved upon an alternative which appeared to him to promise the greatest security, and to hold out the fairest prospect of future tranquillity and happiness to his country, which was to obtain from his countrymen a voluntary surrender of the island to Great Britain. With this view he addressed a letter to them, dated from Furiani, May 1st, 1794, in which he explained at large his views and wishes, and advised that a meeting of the deputies should be held at Corte on the eighth of June following, to take into serious consideration the propriety of concluding the union which he proposed to them. In the conclusion of this letter he writes; "With respect to myself, my dearly beloved countrymen, after having devoted every moment of my life to your happiness, I shall esteem myself the happiest of mankind, if, through the means I have derived from your confidence, I can obtain for our country the opportunity of forming a free and lasting government, and of preserving to Corsica its name, its unity and independence, whilst the names of the heroes who have spilt their blood in its support and defence will be, for future generations, objects of noble emulation, and grateful remembrance." This assembly of the deputies took place on the 14th of June. It was opened by an eloquent speech from Paoli, who took a review of the different events which had transpired, and the measures which had been adopted by him since the separation of the last general consulta in May 1793, explained the purpose for which they had been convoked, and directed them to the weighty measures on which they would have to deliberate. After voting their unanimous thanks to Paoli, and expressing their full approbation of his conduct, they proceeded to declare "the separation of Corsica from France, and with the same unanimity, and with the strongest demonstrations of joy, voted the union of Corsica to the crown of Great Britain:" and it is added, "that no national act was ever sanctioned by a more unanimous proceeding on the part of those who were authorised to do it, or by a more universal approbation, amounting to enthusiasm, on the part of the people." All the proceedings on this occasion were con-

ducted with the strictest order and propriety; no measure being adopted in haste, or settled without full and dispassionate consideration. The necessary previous arrangements being formally concluded, the government was transferred to the English commissioner, sir Gilbert Elliot (now lord Minto), who took possession of it as viceroy for the king of Great Britain. Paoli had now resigned the dignities of office, and reduced himself to the rank of a private citizen. What his intentions might have been with regard to his future residence, whether he meant to pass the remainder of his days in his native country or elsewhere, it is now impossible to say; but it is stated that a coolness which, from some cause or other, had unfortunately taken place between him and the English viceroy, at once determined him to quit Corsica; and he returned to the hospitable shores of that country where he had before experienced the kindest reception, and enjoyed a long interval of comfort and happiness. Having had the misfortune to lose the bulk of his property by the failure of a house at Leghorn, to which he had entrusted it, he was unable, on his return to London, to command the conveniences which his income had before placed within his power, and obliged for some time to live in the most private manner in an obscure part of the town. There is reason to believe, however, that when his pecuniary circumstances became known, prompt measures were adopted to improve them, and that his pension was again restored, and continued to him to the last.

The eventful life of this truly great man, great in all those noble and benign qualities which impart dignity and honour to the living, and consecrate the memory of the dead, was closed, after a short but painful illness, on Thursday the fifth of February, 1807, aged 81 years; and he was buried on Friday the thirteenth of the same month, without pomp or ostentation, in the burying ground of St. Pancras. Though dead, his name shall continue to exist while virtue has a friend. Future generations will contemplate his character with wonder and veneration, and Paoli shall be enrolled among those benefactors of their kind who have immortalized themselves by transcendent actions of benevolence.

The following is an eulogium of no mean worth, drawn by the masterly pen of Voltaire, and occasioned by the consideration of this part of Paoli's conduct. "Quelque chose qu'on ait dit de lui (Paoli) il n'est pas possible que ce chef n'eut de grandes qualités. Etablir un gouvernement regulier chez un peuple qui n'en voulait point; réunir sous les mêmes lois des hommes divisés et indisciplinés; former à la fois des troupes réglées, et instituer une espèce d'université qui pouvait adoucir les mœurs, établir des tribunaux de justice, mettre un frein à la fureur des assassinats et des meurtres, polir la barbarie, se faire aimer en se faisant obéir; tout cela n'était pas assurément d'un homme ordinaire. Il ne put faire assez, ni pour rendre la Corse libre, ni pour y regner

pleinement; mais il en fit assez pour acquérir de la gloire." *Voltaire, Siecle de Louis XV. Article De la Corse.*

PA-OOM, one of the New Hebrides, in the S. Pacific Ocean, to the S. of Malicollo. Lon. 168. 28 W. Lat. 16. 30 S.

PAO-TING-FOU, a city of China, the most considerable in the province of Pei-cheli, next to that of Peking. Its district contains three cities of the second, and 17 of the third class. It is 60 miles S. by W. of Peking.

PAP. *s.* (*papa*, Italian; *pappe*, Dutch; *papilla*, Lat.) 1. The nipple; the dug sucked (*Spenser*). 2. Food made for infants, with bread boiled in water (*Donne*). 3. The pulp of fruit (*Ainsworth*).

PAPA'. *s.* (παππῆς.) A fond name for father, used in many languages (*Swift*).

PAPA, a strong town of Lower Hungary, in the county of Vespri, taken from the Turks, in 1683, after the raising of the siege of Vienna. It is seated on a mountain, near the river Marchaltz, 45 miles W. of Buda. Lon 18. 20 E. Lat. 47. 26 N.

PA'PACY. *s.* (*papauté*, Fr. from *papa*, the pope.) Popedom; office and dignity of bishops of Rome (*Bacon*).

PA'PAL. *a.* (*papal*, Fr.) Popish; belonging to the pope; annexed to the bishopric of Rome (*Raleigh*).

PA'PAVER. Poppy. In botany, a genus of the class polyandria, order monogynia. Calyx two-leaved; corol four-petalled; stigma radiate; capsule superior, discharging its seeds by pores under the permanent stigma. Twelve species, chiefly natives of Europe, six of the corn-fields and wastes of our own country: one or two of the East. Of these some have bristly, others glabrous capsules.

The species cultivated are as follow:

1. P. somniferum. White poppy. Calyx and capsules glabrous: leaves clasping the stem, cut, glaucous; supposed to be originally of Asia; but now found wild in the south of Europe and the wastes of our own country.

There are several varieties differing in the colour and multiplicity of their petals which are preserved in gardens for ornament. It is the single-flowered sort that is chiefly cultivated for use both in our own country and in India.

It is from the heads of this plant that opium is obtained. The seeds of the plant are for this purpose sown at Bahar in the month of October and November, at about eight inches distance, and well watered till the plants are about half a foot high; when they are covered with a stimulating compost of dung, ammoniacal earth and ashes; after which, just before the flowers appear, they are again watered profusely till the capsules are half grown, at which time the opium is collected, for when fully ripe they yield but little juice. Two longitudinal incisions from below upwards, without penetrating the cavity, are made at sun-set for three or four successive evenings; in the morning the juice is scraped off with an iron scoop, and worked in an iron pot in the sun's heat till it is of a

consistence to be formed into thick cakes of about four pounds weight; these are covered over with the leaves of poppy, tobacco, or some other vegetable, to prevent their sticking together, and in this situation they are dried. See OPIUM.

The heads of this plant are also directed for medicinal use in the form of fomentation, and in the syrupus papaveris albi, a useful anodyne, which often succeeds in procuring sleep where opium fails; it is, however, more especially adapted to children. The seeds of this species of poppy contain a bland oil, and in many places are eaten as food; as a medicine, they have been usually given in the form of emulsion in catarrhs, stranguries, &c.

2. *P. rhoeas*. Corn or red poppy. Capsules glabrous, nearly globular; stem many-flowered, bristly; all the bristles spreading horizontally; leaves pinnatifid and cut. Corn-fields: flowers from June to August.

The heads of this species, like those of the somniferum, contain a milky juice of a narcotic quality; from which an extract is prepared, that has been successfully employed as a sedative. The flowers have somewhat of the smell of opium, and a mucilaginous taste, accompanied with a slight degree of bitterness. A syrup of these flowers is directed in the London pharmacopœia, which has been thought useful as an anodyne and pectoral, and is therefore prescribed in coughs and catarrhal affections.

3. *P. Cambricum*. Welch poppy. Capsules glabrous, oblong, ending in a beak; stem many-flowered with a few ascending hairs; leaves pinnate and cut; flowers large and yellow, appearing in June. Indigenous to the stony mountains of Great Britain, and especially of Wales.

4. *P. orientale*. Oriental poppy. Capsules glabrous, globular; stems one-flowered, leafy, rough, with close-pressed bristles; leaves pinnate and serrate, with bristly hairs: flower red. A native of Armenia; and flowers with us in May.

PAPAVEROUS. *a.* (*papavereus*, from *papaver*, Lat.) Resembling poppies (*Brown*).

PAPAW. The fruit of the carica papapa of Linnéus, a native of both Indies, and Guinea coast of Africa. When the roundish fruit are nearly ripe, the inhabitants of India boil and eat them with their meat, as we do turnips. They have somewhat the flavour of a pompon. Previous to boiling, they soak them for some time in salt and water, to extract the corrosive juice, unless the meat they are to be boiled with should be very salt and old, and then this juice being in them will make it as tender as a chicken. But they mostly pickle the long fruit, and thus they make no bad succedaneum for mango. The buds of the female flowers are gathered, and made into a sweetmeat; and the inhabitants are such good husbands of the produce of this tree, that they boil the shells of the ripe fruit into a repast, and the insides are eaten with sugar in the manner of melons.

PAPAW TREE (North American), a species of *ANNONA*, which see.

PAPER, a thin flexible leaf, usually white, artificially prepared of some vegetable substance, chiefly to write upon, with ink.

The word is formed from the Greek *παπυρος*, *papyrus*, the name of an Egyptian plant, called also *βιβλος*, *biblus*, whereon the ancients used to write.

Various are the materials, on which mankind in different ages and countries have contrived to write their sentiments; as on stones, bricks, the leaves of herbs and trees, and their rinds or barks; also on tables of wood, wax, and ivory; to which may be added plates of lead, linen rolls, &c. At length the Egyptian papyrus was invented; then parchment, then cotton paper, and lastly, the common, or linen paper.

In some places and ages they have even written on the skins of fishes; in others, on the intestines of serpents; and in others, on the backs of tortoises. Mabill. de Re Diplom. lib. i. cap. 8. Fabric. Biblioth. Nat. cap. 21, &c. There are few sorts of plants but have at some time been used for paper and books: and hence the several terms, biblos, codex, liber, folium, tabula, tellura, philura, scheda, &c. which express the several parts on which they were written: and though in Europe all these disappeared upon the introduction of the papyrus and parchment, yet in some other countries the use of divers of them obtains to this day. In Ceylon, for instance, they write on the leaves of the talipot. And the Bramin MSS. in the Tulinga language, sent to Oxford from Fort St. George, are written on leaves of the ampana, or palma Malabarica: Hermannus gives an account of a monstrous palm-tree called coddia panna, or palma montana Malabarica, which about the thirty-fifth year of its age rises to be sixty or seventy feet high, with plicated leaves nearly round, twenty feet broad; wherewith they commonly cover their houses; and on which they also write; part of one leaf sufficing to make a moderate book. They write between the folds, making the characters through the outer cuticle. Knox. Hist. Ceyl. lib. iii. Le Clerc. Bibl. Univ. tom. xxiii. p. 242. Phil. Trans. No. 226. p. 422, seq. Vide Hort. Ind. Malab. p. 3. Phil. Trans. No. 145. p. 108.

In the Maldivée islands, the natives are said to write on the leaves of a tree called macaraquean, which are a fathom and a half long, and about a foot broad. And in divers parts of the East Indies, the leaves of the musa arbor, or plantain-tree, dried in the sun, served for the same use.

Egyptian paper was principally used among the ancients; being made of the papyrus, or biblus, a species of rush, which grew on the banks of the Nile: in making it into paper, they began with lopping off the two extremes of the plant, the head and the root: the remaining part, which was the stem, they cut lengthwise into two nearly equal parts, and from each of these they stripped the scaly pellicles of which it consisted. The innermost of these pellicles were looked on as the best, and that nearest the rind as the worst: they were therefore kept apart, and made to constitute two different sorts of paper. As the pellicles were taken off, they extended them on a table, laying them over each other transversely, so as that the fibres made right angles: in this state they were glued together by the muddy waters of the Nile; or, when those were not to be had, with paste made of the finest wheat flour, mixed with hot water and a sprinkling of vinegar.

PAPER.

The pellicles were next pressed, to get out the water, then dried, and lastly flattened and smoothed by beating them with a mallet: this was the Egyptian paper, which was sometimes further polished by rubbing it with a glass ball, or the like.

Bark paper was only the inner whitish rind, inclosed between the bark and the wood of several trees, as the maple, plane, beech, and elm, but especially the tilia, or linden-tree, which was that mostly used for this purpose. On this, stripped off, flattened, and dried, the ancients wrote books, several of which are said to be still extant.

Chinese paper is of various kinds; some is made of the rinds or barks of trees, especially the mulberry-tree and elm, but chiefly of the bamboo and cotton-tree. In fact, almost each province has its several paper. The preparations of paper made of the barks of trees may be instanced in that of the bamboo, which is a tree of the cane or reed kind. The second skin of the bark, which is soft and white, is ordinarily made use of for paper: this is beat in fair water to a pulp, which they take up in large moulds, so that some sheets are above twelve feet in length: they are completed by dipping them, sheet by sheet, in alum water, which serves instead of the size among us, and not only hinders the paper from imbibing the ink, but makes it look as if varnished over. This paper is white, soft, and close, without the least roughness, though it cracks more easily than European paper; is very subject to be eaten by the worms, and its thinness makes it liable to be soon worn out.

Cotton paper is a sort of paper which has been in use upwards of six hundred years. In the grand library at Paris are manuscripts on this paper, which appear to be of the tenth century; and from the twelfth century, cotton manuscripts are more frequent than parchment ones. Cotton paper is still made in the East Indies, by beating cotton a rags to pulp.

Linen or European paper appears to have been first introduced among us towards the beginning of the fourteenth century, but by whom this valuable commodity was invented is not known. The method of making paper of linen or hempen rags is as follows.

The first instrument is called the duster, made in the form of a cylinder, four feet in diameter, and five feet in length. It is altogether covered with a wire net, and put in motion by its connexion with some part of the machinery. A convenient quantity of rags before the selection are inclosed in the duster, and the rapidity of its motion separates the dust from them, and forces it through the wire. It is of considerable advantage to use the duster before selection, as it makes that operation less pernicious to the selectors.

The selection is then to be made; and it is found more convenient to have the tables for cutting off the knots and stitching, and for forming them into a proper shape, in the same place with the cutting-table. The surface both of these and of the cutting-table is composed of a wire net, which in every part of the operation allows the remaining dust and refuse of every kind to escape.

The rags, without any kind of putrefaction, are again carried from the cutting-table back to the duster, and from thence to an engine, where, in general, they are in the space of six hours re-

duced to the stuff proper for making paper. The hard and soft of the same quality are placed in different lots; but they can be reduced to stuff at the same time, provided the soft is put somewhat later into the engine.

The engine is that part of the mill which performs the whole action of reducing the rags to paste, or, as it may be termed, of trituration. The number of the engines depends on the extent of the paper-work, on the force of water, or on the construction of the machinery.

When the stuff is brought to perfection, it is conveyed into a general repository, which supplies the vat from which the sheets of paper are formed. This vat is made of wood; and generally about five feet in diameter, and two and a half in depth. It is kept in temperature by means of a grate introduced by a hole, and surrounded on the inside of the vat with a case of copper. For fuel to this grate, charcoal or wood is used; and frequently, to prevent smoke, the wall of the building comes in contact with one part of the vat, and the fire has no communication with the place where they make the paper.

Every vat is furnished on the upper part with planks inclosed inwards, and even railed in with wood, to prevent any of the stuff from running over in the operation. Across the vat is a plank which they call the trepan, pierced with holes at one of the extremities, and resting on the planks which surround the vat.

The forms or moulds are composed of wire cloth, and a moveable frame. It is with these that they fetch up the stuff from the vat, in order to form the sheets of paper. The sides of the form are made of oak, which is previously steeped in water, and otherwise prepared to prevent warping. The wire cloth is made larger than the sheet of paper, and the excess of it on all sides is covered with a moveable frame. This frame is necessary to retain the stuff of which the paper is made on the cloth; and it must be exactly adapted to the form, otherwise the edges of the paper will be ragged and badly finished. The wire cloth of the form is varied in proportion to the fineness of the paper and the nature of the stuff.

The felts are pieces of woollen cloth spread over every sheet of paper, and upon which the sheets are laid to detach them from the former, to prevent them from adhering together, to imbibe part of the water with which the stuff is charged, and to transmit the whole of it when placed under the action of the press. The two sides of the felt are differently raised: that of which the hair is longest is applied to the sheets which are laid down; and any alteration of this disposition would produce a change in the texture of the paper. The stuff of which the felts are made should be sufficiently strong, in order that it may be stretched exactly on the sheets without forming into folds; and, at the same, sufficiently pliant to yield in every direction without injury to the wet paper. As the felts have to resist the reiterated efforts of the press, it appears necessary that the warp be very strong, of combed wool, and well twisted. On the other hand, as they have to imbibe a certain quantity of water, and to return it, it is necessary that the woof be of carded wool, and drawn out into a slack thread. These are the utensils, together with the press, which are used in the apartment where the sheets of paper are formed.

The vat being furnished with a sufficient quan-

P A P E R.

tity of stuff and of water, two instruments are employed to mix them; the one of which is a simple pole, and the other a pole armed with a piece of board, rounded and full of holes. This operation is repeated as often as the stuff falls to the bottom. In the principal writing-mills in England, they use for this purpose what is called a hog; which is a machine within the vat, that, by means of a small wheel on the outside, is made to turn constantly round, and keep the stuff in perpetual motion. When the stuff and water are properly mixed, it is easy to perceive whether the previous operations have been complete. When the stuff floats close, and in regular flakes, it is a proof that it has been well triturated; and the parts of the rags which have escaped the rollers also appear.

After this operation the workman takes one of the forms, furnished with its frame, by the middle of the short sides; and fixing the frame round the wire cloth with his thumbs, he plunges it obliquely four or five inches into the vat, beginning by the long side, which is nearest to him. After the immersion he raises it to a level: by these movements he fetches up on the form a sufficient quantity of stuff; and as soon as the form is raised, the water escapes through the wire cloth, and the superfluity of the stuff over the sides of the frame. The fibrous parts of the stuff arrange themselves regularly on the wire cloth of the form, not only in proportion as the water escapes, but also as the workman favours this effect by gently shaking the form. Afterwards, having placed the form on a piece of board, the workman takes off the frame or deckle, and glides this form towards the coucher; who, having previously laid his felt, places it with his left hand in an inclined situation, on a plank fixed on the edge of the vat, and full of holes. During this operation the workman applies his frame, and begins a second sheet. The coucher seizes this instant, takes with his left hand the form, now sufficiently dry, and, having laid the sheet of paper upon the felt, returns the form by gliding it along the trepan of the vat.

They proceed in this manner, laying alternately a sheet and a felt, till they have made six quires of paper, which is called a post: and this they do with such swiftness, that, in many sorts of paper, two men make upwards of twenty posts in a day. When the last sheet of the post is covered with the last felt, the workmen about the vat unite together, and submit the whole heap to the action of the press. They begin at first to press it with a middling lever, and afterwards with a lever about fifteen feet in length. After this operation, another person separates the sheets of paper from the felts, laying them in a heap; and several of these heaps collected together are again put under the press.

The stuff which forms a sheet of paper is received, as we have already said, on a form made of wire cloth, which is more or less fine in proportion to the stuff, and surrounded with a wooden frame, and supported in the middle by many cross bars of wood. In consequence of this construction, it is easy to perceive, that the sheet of paper will take and preserve the impressions of all the pieces which compose the form, and of the empty spaces between them.

The traces of the wire cloth are evidently perceived on the side of the sheet which was attached to the form, and on the opposite side they form

an assemblage of parallel and rounded risings. As in the paper which is most highly finished the regularity of these impressions is still visible, it is evident that all the operations to which it is submitted have chiefly in view to soften these impressions without destroying them. It is of consequence, therefore, to attend to the combination of labour which operates on these impressions. The coucher, in turning the form on the felt, flattens a little the rounded eminences which are in relief on one of the surfaces, and occasions at the same time the hollow places made by the wire cloth to be partly filled up. Meanwhile, the effort which is made in detaching the form produces an infinite number of small hairs on every protuberant part of the sheet.

Under the action of the press, first with the felts and then without them, the perfecting of the grain paper still goes on. The vestiges of the protuberances made by the wires are altogether flattened, and of consequence the hollows opposite to them disappear also; but the traces formed by the interstices of the wire, in consequence of their thickness, appear on both sides, and are rounded by the press.

The risings traced on each side of the paper, and which can be discovered by the eye on that which is most highly finished, form what is called the grain of paper. The different operations ought to soften, but not destroy it; which is effectually done by employing the hammer. This grain appears in the Dutch paper; which is a sufficient proof that though they have brought this part of the art to the greatest perfection, they have not employed hammers, but more simple and ingenious means. The grain of paper is often disfigured by the felts when they are too much used, or when the wool does not cover the thread. In this case, when the paper is submitted to the press, it takes the additional traces of the warp and the woof, and composes a surface extremely irregular.

The paper the grain of which is highly softened, is much fitter for the purposes of writing than that which is smoothed by the hammer: on the other hand, a coarse and unequal grain very much opposes the movements of the pen; as that which is beat renders them very uncertain. The art of making paper, therefore, should consist in preserving, and at the same time in highly softening, the grain: the Dutch have carried this to the highest perfection.

The exchange succeeds the operation last described. It is conducted in a hall contiguous to the vat, supplied with several presses, and with a long table. The workman arranges on this table the paper, newly fabricated, into heaps; each heap containing eight or ten of those last under the press, kept separate by a woollen felt. The press is large enough to receive two of them at once, placed the one at the other's side. When the compression is judged sufficient, the heaps of paper are carried back to the table, and the whole turned sheet by sheet, in such a manner that the surface of every sheet is exposed to a new one; and in this situation they are again brought under the press. It is in conducting these two operations sometimes to four or five times, or as often as the nature of the paper requires, that the perfection of the Dutch plan consists. If the stuff is fine, or the paper slender, the exchange is less frequently repeated. In this operation it is necessary to alter the situation of the heaps, with regard to one another, every

P A P E R.

time they are put under the press; and also, as the heaps are highest toward the middle, to place small pieces of felt at the extremities, in order to bring every part of them under an equal pressure. A single man with four or five presses may exchange all the paper produced by two vats, provided the previous pressing at the vats is well performed. The work of the exchange generally lasts about two days on a given quantity of paper.

When the paper has undergone these operations, it is not only softened in the surface, but better felted, and rendered more pliant in the interior parts of the stuff. In short, a great part of the water which it had imbibed in the operation of the vat is dissipated. By the felt-ing of paper is understood the approximation of the fibres of the stuff, and their adhering more closely together. The paper is felted in proportion as the water escapes, and this effect is produced by the management and reiterated action of the press. Was it not for the gradual operation of the press, the paper would be porous, and composed of filaments adhering closely together. The superiority of the Dutch over the French paper depends almost entirely on this operation.

If the sheets of paper are found to adhere together, it is a proof that the business of the press has been badly conducted. To avoid this inconvenience, it is necessary to bring down the press at first gently, and by degrees with greater force, and to raise it as suddenly as possible. By this means the water, which is impelled to the sides of the heaps, which has not yet escaped, returns to the centre; the sheets are equally dry, and the operation is executed without difficulty.

According to the state of dryness in which the paper is found when it comes from the apartment of the vat, it is either pressed before or after the first exchange. The operation of the press should be reiterated, and managed with great care; otherwise, in the soft state of the paper there is a danger that its grain and transparency are totally destroyed. Another essential principle to the success of the exchange is, that the grain of the paper is originally well raised. For this purpose the wire cloth of the Dutch forms is composed of a rounder wire than that used in France, by which they gain the greatest degree of transparency, and are in no danger of destroying the grain. Besides this, the Dutch take care to proportion the wires even where the forms are equal to the thickness of the paper.

Almost every kind of paper is considerably improved by the exchange, and receives a degree of perfection which renders it more agreeable in the use. But it is necessary to observe at the same time, that all papers are not equally susceptible of this melioration; on the contrary, if the stuff is unequal, dry or weakened by the destruction of the fine parts, it acquires nothing of that lustre and softness, and appearance of velvet, which the exchange gives to stuff properly prepared.

The sheds for drying the paper are in the neighbourhood of the paper-mill, and are furnished with a vast number of cords, on which they hang the sheets both before and after the sizing. The sheds are surrounded with moveable lattices, to admit a quantity of air sufficient for drying the paper. The cords of the shed are stretched as much as possible; and the paper, four or five sheets of it together, is placed on them by means of a wooden instrument resembling a pick-axe.

The principal difficulty in drying the paper consists in gradually admitting the external air, and in preventing the cords from imbibing moisture. With regard to the first of these, the Dutch use very low sheds, and construct their lattices with great exactness. By this means the Dutch paper is dried equally, and is extremely supple before the sizing. They prevent the cords from imbibing the water by covering them with wax. In using such cords, the moisture does not continue in the line of contact between the paper and the cord, which prevents the sheet from stretching in that particular place by its weight, and from the folds which the moisture in the subsequent operations might occasion. The Dutch also employ cords of considerable thickness, and place fewer of them under the sheets; by which means they diminish the points of contact, and give a freer and more equal circulation to the air.

The size for paper is made of the shreds and parings got from tanners, curriers, and parchment-makers. All the putrefied parts and the lime are carefully separated from them, and they are inclosed in a kind of basket, and let down by a rope and pulley into the cauldron. This is a late invention, and serves two valuable purposes. It makes it easy to draw out the pieces of leather when the size is extracted from them by boiling, or easy to return them into the boiler if the operation is not complete. When the substance is sufficiently extracted it is allowed to settle for some time; and it is twice filtered before it is put into the vessel into which they dip the paper.

Immediately before the operation a certain quantity of alum is added to the size. The workman takes a handful of the sheets, smoothed and rendered as supple as possible, in his left hand, dips them into the vessel, and holds them separate with his right, that they may equally imbibe the size. After holding them above the vessel for a space of time, he seizes on the other side with his right hand, and again dips them into the vessel. When he has finished ten or a dozen of these handfuls, they are submitted to the action of the press. The superfluous size is carried back to the vessel by means of a small pipe. The vessel in which the paper is sized is made of copper, and furnished with a grate, to give the size when necessary a due temperature: and a piece of thin board or felt is placed between every handful as they are laid on the table of the press.

The Dutch are very careful in sizing their paper, to have every sheet in the same handful of equal dryness; because it is found that the dry sheets imbibe the size more slowly than those which retain some degree of moisture. They begin by selecting the padges in the drying-house; and after having made them supple, and having destroyed the adherence between the sheets, they separate them into handfuls in proportion to the dryness, each of them containing that number which they can dip at one time. Besides this precaution, they take care to apply two sheets of brown paper of an equal size to every handful. This brown paper, firm, solid, and already sized, is of use to support the sheets.

As soon as the paper is sized, it is the practice at some paper-mills to carry it immediately to the drying-house, and hang it before it cools, sheet by sheet, on the cords. The paper, unless particular attention is paid to the lattices of the drying-house, is apt to dry too fast, whereby a great part of the size goes off in evaporation; or, if too slow, it falls to the ground. The Dutch drying-houses are

P A P E R.

the best to prevent these inconveniences: but the exchange after the sizing, which is generally practised in Holland, is the best remedy. They begin this operation on the handfuls of paper, either while they are still hot, or otherwise as they find it convenient. But, after the exchange, they are careful to allow the heaps to be altogether cold before they are submitted to the press. Without this precaution the size would either be wholly squeezed out by the press of the exchange, or the surface of the paper become very irregular. It is of consequence that the paper, still warm from the sizing, grows gradually firm, under the operation of the exchange, in proportion as it cools. By this method it receives that varnish which is afterwards brought to perfection under the press, and in which the excellence of the paper either for writing or drawing chiefly consists. It is in consequence of the exchanging and pressing that the Dutch paper is soft and equal; and that the size penetrates into the body of it, and is extended equally over its surface.

The exchange after the sizing ought to be conducted with the greatest skill and attention, because the grain of the paper then receives impressions which can never be eradicated. When the sized paper is also exchanged, it is possible to hang more sheets together on the cords of the drying house. The paper dries better in this condition, and the size is preserved without any sensible waste, because the sheets of paper mutually prevent the rapid operation of the external air. And as the size has already penetrated into the paper, and is fixed on the surface, the insensible progress of a well-conducted drying-house renders all the good effects more perfect in proportion as it is slowly dried.

If to these considerations is added the damage done to the paper in drying it immediately after the press of the sizing-room, whether it is done in raising the hairs by separating the sheets, or in cracking the surface, it is evident that the trouble of the second exchange is infinitely overpaid by the advantage.

When the paper is sufficiently dry, it is carried to the finishing-room, where it is pressed, selected, examined, folded, made up into quires, and finally into reams. It is here put twice under the press; first, when it is at its full size, and secondly, after it is folded.

The principal labour of this place consists in assorting the paper into different lots, according to its quality and faults; after which it is made up into quires. The person who does this must possess great skill, and be capable of attention, because he acts as a check on those who separated the paper into different lots. He takes the sheets with his right hand, folds them, examines them, lays them over his left arm till he has the number requisite for a quire, brings the sides parallel to one another, and places them in heaps under the table. An expert workman, if proper care has been taken in assorting the lots, will finish in this manner near 6000 quires in a day.

The paper is afterwards collected into reams of 20 quires each, and for the last time put under the press, where it is continued for 10 or 12 hours, or as long as the demand of the paper-mill permits. We shall now explain the structure of one of the best paper-mills now in use.

The plan is exhibited in plate 130, where AA is the water wheel fixed upon its shaft or axle BB; on which axle is also fastened the wheel CC, containing 78 teeth or cogs, to turn the wheel No. 2.

having 27 teeth, which is placed upon the lower end of the axle W. Upon the same axle is fixed the wheel No. 3. containing 72 teeth, to drive the two pinions No. 4. and 4. each of them having 14 teeth, which are fastened upon the iron axles or spindles, on which axles are likewise fixed the cutting or beating rollers No. 6. and 6. DD, are the engine troughs or boxes in which the beating rollers revolve. EE, a platform round the engines. TT, an elevation of the engine troughs. No. 7. the beating roller, round the circumference of which are fixed plates of steel that cut or beat the rags, by passing over several steel plates screwed together, and fixed in the bottom of the trough with their edges facing the roller. No. 8. and 8. the blinds, or slip-boards and washers. FF is the frame of the glazing machine. XX, the axle and pivots on which the glazing pole is suspended; the pole being moved by the rod VV, one end of which goes upon a bend or crank in the iron spindle that carries the pinion No. 5. having 15 teeth, which is turned by the wheel No. 3. UU, a lever for raising the glazing plate to the pole, or depressing it at pleasure. GG and HH, are the screw presses. II, the windlass and lever for setting the press. NN, the mill-house; and MM, the vat-houses adjoining to it. RR, a stair leading to the lofts. SS, furnaces or fire-places in the wall. Q, a door in the side wall of the mill-house. OP, windows to light the mill-house.

Elevation.—Plate 131. AA, the great wheel, containing 40 float-boards or awls, upon which the water impinges to drive the wheel. B, The shaft or axle of the great wheel. On this axle is also fixed the wheel CC, in which are 78 teeth or cogs, to turn the wheel No. 2. having 27 teeth, which is fastened upon the perpendicular axle ZZ; on which shaft is likewise placed the wheel No. 3. containing 72 teeth, to turn the pinions No. 4. and 4. having each 14 teeth, which are fixed upon the iron axles or spindles, on which spindles are fastened the cutting or beating rollers No. 6. and 6. DD, the engine troughs in which the beating rollers revolve. EE, are covers that inclose the rollers. GG, the frame that carries the axles with the wheels. FF the frame of the glazing engine. XT, the glazing pole suspended on its gudgeon at X, and moved by the horizontal rod T, from a crank or bend in an iron spindle that carries a pinion at No. 5. driven by the wheel No. 3. (which is seen in the plan in No. 1.) V, the glazing plate, made of cast iron, fixed upon a bearer that moves on an iron bolt in the frame at W; and the plate V is raised up at pleasure to the glazing pole XT, by pressing down the longer arm of the lever UU, which moves on an iron bolt in the frame. The gudgeons of axles and rounds of spindles should all turn in bushes of brass. HH, fall or course of the water. KK, the machine and handle that raise the sluice to let the water on the great wheel to turn it round. YY, are frames that support the engines and platforms round them. LL, walls of the mill-house. RR, the couples or frame of the roof. MM, the walls of the vat-houses. NN, their roofs. OP, windows to light the lower part of the house. SS. a stair going up to the lofts. QQ, windows in the upper part of the mill-house, commonly made use of for drying the paper. This description of a paper-mill we have extracted from Gray's Millwright.

In April, 1805, Mr. Joseph Bramah took out a patent for sundry improvements in the art of making paper. These improvements are directed to

P A P E R.

four distinct objects in the process of making paper. 1. To perform the office of moulder of the sheets by machinery. 2. To a contrivance for making paper of "endless" sheets. 3. To obviate the necessity of employing many presses for dry work. 4. To render the raising and taking down the ponderous frames on which the paper is hung in the drying-house unnecessary.

From the attainment of the first object it results that the moulding of the sheets may be conducted by persons not possessing the usual skill of those employed in the paper manufactory; and by such application of machinery, sheets of much larger than usual dimensions can easily be made pretty uniform in their weight and thickness. To accomplish this, the dimensions of the vat, called the regulating reservoir, in which the stuff for moulding is usually put, are to be in length and width, exactly the same as those of the proposed sheet, and about 20 inches deep; this vat contains a frame or rim of wood, which is made to slide up and down at pleasure, and, in such manner that the frame may be raised or depressed by a handle or winch applied externally. The paper mould is also carefully fitted on all sides to the interior of the reservoir, and is rested upon the sliding rim so as to be lifted up or lowered, still retaining an horizontal position when the frame is moved down or up for that purpose; the mould and frame moving always uniformly together. On the side or end of this reservoir near the bottom, is cut a tolerably large aperture, through which the water that filled the reservoir can quickly discharge itself. This aperture communicates with a hollow trunk; and there is another cistern, viz. the feeder or stuff-cistern, which has an agitator to prevent the unequal mixing of the pulp and water; but the minuter details of the various parts cannot well be given here.

When the whole is ready for action the regulating reservoir is filled with water till it discharges at the mouth of the external trunk; and then the mould, being at the lowest station, has the wire surface immersed more than a quarter of an inch below the surface of the water; and the valve or lid which covers the mouth of the trunk being then shut, prevents the escape of the water from the interior of the reservoir. While the machine is in this situation, the sluice which opens the communication between the feeder above the mould is lifted up, and admits the stuff from the feeding cistern to flow upon the surface of the mould to any limited gauge allowed for the sheet: when this quantity has flowed, the sluice is quickly shut; and then, by the motion of the apparatus, which lifts and lowers the frame and mould, it is raised with more or less slowness, as experience may suggest, up to its greatest altitude. By opening the valve of the waste trunk at the instant the mould begins to rise, all the water is immediately discharged from above the mould by passing through the wire into the lower part, and is carried off to the former level of the waste, being thus prepared for the depression of another mould: for the loaded one, when raised to its highest station, is made to push away on slides to meet the coucher's hand, who at the same time furnishes the alternate mould; and when the mould is again depressed, the waste valve being shut, the machine is fitted for a second charge; and thus the process is continued with ease and certainty.

By the second improvement paper is made in sheets of any length and width whatever, by a cir-

culating process performed with a wheel or circular frame, composed of rings of thin wood or metal, of three feet or more in diameter, and of a width suitable to the size of paper intended to be made. This wheel is mounted on a horizontal axis, and has a shield on each side the upper extremity of its periphery, made to fit the edges of the extreme rings, in a segment form nearly watertight, so as to prevent the lateral discharge of fluid passing over the wheel. These rings are kept at their stationary distance by transverse thin bars or ribs similar to those used to strengthen a common paper mould; and when this is done, all the face of this wheel is covered or worked with wire so as to form a complete circular mould. This mould or wheel being placed so as to be capable of being turned by hand or otherwise, a feeding cistern, prepared with stuff (as before), is stationed above the wheel; and by means of a sluice or regulator, this stuff may be let upon the wheel in any required quantity, as that wheel is turning on its axis. Thus, while the water is uniformly carried off by falling through the wire, the pulp is left upon the wheel, as in the instance of the common mould, and a constant and endless process may be kept up to any extent. This Mr. Bramah calls an universal revolving paper mould, in addition to which he fixes a little above or below the horizontal plane passing through the centre of the wheel, and opposite to the feeding point, a roller covered with felt; such roller being fixed in contact with the wheel by means of two springs upon the axis of the former, which regulates and renders uniform and gentle the contact of their peripheries as they are turning each other round,—for it signifies not to which of the axes the mover is applied. This is called the couching roller, since it takes the paper from the mould as they mutually turn. Two other rollers are also covered with felt, or woollen cloth, and placed in firmer contact with each other, and between them the sheet is conducted from the couching roller. These are called squeezing rollers; and after the paper has passed through them it may be passed successively between others, and thus made as dry as possible. The paper is then to be conducted over heated plates, charcoal, or other fires, or passed between the rollers of heated calenders; so that when it leaves the machine it may be fit for use.

By the third improvement the necessity of employing many presses for the dry work is obviated. Mr. Bramah constructs a press on what he calls his patent hydro-mechanical principle, of sufficient power, capacity, and strength, to receive the largest sheets proposed to be made; and also competent to withstand the greatest exertion the preparation of each class of paper may require from the press. This press is to be stationed about the middle of the room where the dry-press work in a paper-mill is carried on: and a rail-road of wood or metal, similar to the rail-roads used in larger works, is extended in a straight line to some distance on each side of the press; so that, by means of this, carriages or planks, moving on small wheels or casters, may be wheeled into the press on one side, and pressed through it to the opposite, when the process of pressing is completed. Instead of more presses, Mr. Bramah proposes to use a considerable number of another kind of apparatus called retainers, which consist of a top and bottom bed of wood or metal, of sufficient strength to resist the re-action of the paper when the press is slackened from its severest squeeze, and to retain it in its

P A P E R.

most compressed state for any required length of time, after the grasp of the press has been finally withdrawn: in these retainers vertical bars are fixed at the corners of the lower bed, slide through slits in the upper one, and have each several holes to receive wedges or keys; by which the upper bed of the retainer is made to preserve the state into which it has been pressed, notwithstanding any efforts of the paper and felts to expand to the space they originally occupied. The process of moving these retainers under the press, fixing the upper bed, and then removing the retainer, by means of the rail-road, may be easily understood without dwelling upon particulars. It may just be observed, however, that the head of the press is made so much narrower as to admit the four bars which compose the sides or jambs of each retainer to pass it on each side during the upward motion of the press (for it must be recollected that in Mr. Bramah's press the lower part is compelled to move upward) as the paper is compressed; or, in some cases, four holes are made through the head, or upper bed of the press itself.

By the fourth improvement, which saves the manual labour of raising up and taking down the cumbersome frames on which the paper is hung, much facility is given to the process of hanging and re-hanging the sheets exposed to be dried. The contrivance consists simply in having a proper number of frames something similar to laundress's clothes-horses, stationed at suitable distances from each other by means of upright posts, with grooves fitted to the frames, so that each may be slid vertically up and down by means of lines and pulleys attached to each, just like sash-windows double hung; so that while one of the frames is slid up to touch the ceiling of the building with its upper edge, the one connected with it may be depressed till its lower edge, or the paper which hangs upon it, may come nearly in contact with the floor. Thus the paper may easily be hung on the frames while they are down within reach, and then they may be elevated to any convenient altitude for drying.

The well-known and established ingenuity of Mr. Bramah, as a mechanical inventor, will always ensure a candid and respectful attention to whatever improvements he may suggest: and in the case of the present specification some material advantage will doubtless result from the adoption of his proposed contrivances. Of these, that described under the second head will be found of much utility in the manufacture of paper for large maps and for the hanging of rooms: but we apprehend that in actual practice some difficulties will arise (which may not yet have occurred to the mind of the inventor), from the effect of contrary forces during the motion of the wheel: with too rapid a motion the centrifugal force would cause the particles upon the wheel to be scattered, which are to constitute the paper; while with too slow a motion the effect of the gravitating force would cause several of them to fall off. Perhaps, however, Mr. B. may advert to these points when he speaks of the "speed which nothing but practice and attention to necessary circumstances can determine."

It ought also to be remarked that Mr. B.'s method of drying by heated plates, charcoal fires, &c. cannot be universally applicable: in many kinds of paper where the beauty consists in softening the grain without destroying it, this method could not, we believe, be adopted at all. Under the action of the press in the common way, first with the

felts, and then without them, the perfecting of the grain of the paper still proceeds; and the business of the exchange, as the workmen term it, completes the process: but in all this some days are generally employed; and we fancy the nature of the paper would undergo a great and depreciating change, if the sheets were attempted to be brought to the same state of dryness, in a few hours or minutes.

Other patents for nearly like purposes have been taken out by Messrs. Fourdrinier; for descriptions of which see Retrospect of Discoveries, No. 9 and 15.

In a late volume of the *Annales de Chimie* we meet with some useful hints relative to the manner of re-manufacturing the paper of old books, or any letters or other paper already used for writing or printing, by MM. Deyeux, Pelletier, Molard, and Verkaven.

I. Process for re-fabricating printed paper:—All paper of the same quality should be collected, and separated from such as may have any writing on the pages; the edges of those leaves which may have become yellow, and also the backs of books, being cut off by the instrument used by bookbinders. One hundred weight of paper is now to be put, sheet by sheet, into vats, sufficiently capacious to contain it, together with 500 quarts of hot water, but which ought to be filled about one-third: the whole is next stirred by two men for the space of one hour, who are gradually to add as much water as will rise about three inches above the paper; after which it is left to macerate four or five hours; the agitation being occasionally repeated, so as to separate, and at length to form the paper into a kind of paste.

The water is now drawn off by means of pipes, and the pulp conveyed to the mill, where it is to be coarsely ground for one hour; at the expiration of which it is boiled in a cauldron for a similar space, with a sufficient quantity of water to rise four or five inches above it. A short time before the mixture begins to boil, thirteen quarts of caustic ley of potash are to be added to every cwt. of paper. The ley alluded to is prepared by dissolving 100lbs. of potash in 300 quarts of boiling water, to which are to be added 20lbs. of pulverized quick-lime; and the whole must be briskly agitated, till it become of an uniform consistence, when it is suffered to stand for 12 hours; at the end of this time it must be drawn off, and 75 quarts of boiling water added to the sediment, which being stirred for half an hour, and suffered to stand till it become clear, is to be mixed with the liquor first decanted.

When the paste has boiled in this ley for one hour, the fire is to be extinguished, and the matter suffered to macerate for 12 hours; after which it must be taken out, drained, put into bags, and submitted to the action of a strong press for a similar length of time, to deprive it of all moisture; and, if it appear white, so that the printer's ink be properly extracted, it may be re-manufactured in the usual manner.

II. Process for the re-fabrication of written paper:—The paper must be sorted; the yellow edges cut off; and the whole thrown, leaf by leaf, into a tub half full of boiling water, where it is to be agitated as before directed. After it has macerated four hours, the water should be drawn off; a fresh quantity of boiling water added; and the mixture stirred for half an hour: at the expiration of which the paper is again left to dissolve for three hours.

PAPER.

The fluid is now drawn off, and 260 quarts of cold water poured on each cwt. of paper; which being perfectly mixed, 6lbs. of oil of vitriol are to be gradually added; and the whole strongly agitated for a considerable time, that the paper may thoroughly imbibe the liquor.

This composition is next suffered to macerate for twelve hours; the agitation being occasionally repeated, when the tub is to be filled up with cold water; and the mixture again stirred, to wash the paper, which will now be reduced to a perfect paste. Lastly, after drawing off the water, the pulp must be put into bags, pressed, and ground in a mill; after which it is conveyed to the vat, and worked in the manner practised with linen rags.

In the year 1801 a patent was granted to Mr. Koops, for extracting ink from printed paper, and restoring it to its original state. His process varies little from that above described; the paper being agitated in hot water to extract the size, and reduce it into a pulp: next, the adhesion of the ink is to be removed by a caustic alkali prepared of lime and potash, the quantities of which should be proportioned to those of the paper. After discharging the ink, he directs the pulp to be bleached by means of the oxygenated marine acid, in the proportion of 10 or 12 gallons to 140lbs. of the material; and, when sufficiently whitened, it is re-manufactured in the usual manner. According to the patentee's account, writing paper does not require so large a proportion, if any, of the caustic alkali; but is bleached by confining it in a wooden box, rendered air tight; into which the acid gas is thrown directly from the retort wherein it was produced.

The staining or dyeing of paper is performed by applying, with soft brushes, any of the colours used for tinging other substances, after tempering them properly with size or gum-water. Should the paper not be sufficiently hard to receive the tint without sinking, it will first be necessary to size it, or to employ a larger proportion of gum with the tinging matters. And if the paper is to be of a uniform colour, the latter must be fixed by several thin coatings, each being suffered to dry before another is applied; as the shade will otherwise appear unequal.

As writing paper is often imperfectly sized, in consequence of which the ink is apt to sink, it has been recommended to dissolve a small piece of Roman alum in a glass of pure water. This liquor should be gently spread over the suspected part, with a soft sponge; and, after becoming dry, it may be safely used for writing. Should there be any occasion to write on a printed book, or on paper that is too fresh and moist, it will only be necessary to mix a little gum with the ink. Lastly, in case any book or manuscript be stained with oil, or grease, it has been directed to calcine and pulverize the bones of sheep's trotters; and to apply a small portion of the powder to each side of the stain, which should be placed between two sheets of white paper, and the whole submitted for the space of twelve hours to the action of a press: if the stains do not disappear, the process should be repeated in a warm place.

PAPERHANGINGS (Painting of). There are three methods of effecting this. The first by printing on the colours; the second by using the stencil; and the third by laying them on with a pencil, as in other kinds of painting. When the colours are laid on by printing, the impression is made by wooden prints, which are cut in such a manner that the figure to be expressed is made to project

from the surface by cutting away all the other part; and this, being charged with the colours tempered with their proper vehicle, by letting it gently down on the block on which the colour is previously spread, conveys it from thence to the ground of the paper, on which it is made to fall more forcibly by means of its weight, and the effort of the arm of the person who uses the print. It is easy to conclude that there must be as many separate prints as there are colours to be printed. But where there are more than one, great care must be taken, after the first, to let the print fall exactly in the same part of the paper as that which went before; otherwise the figure of the design would be brought into irregularity and confusion. In common paper of low price, it is usual, therefore, to print only the outlines, and lay on the rest of the colours by stencilling, which both saves the expense of cutting more prints, and can be practised by common workmen, not requiring the great care and dexterity necessary to the using several prints. The manner of stencilling the colours is this: the figure, which all the parts of any particular colour make in the design to be painted, is to be cut out in a piece of thin leather or oil-cloth, which pieces of leather, or oil-cloth, are called stencils; and being laid flat on the sheets of paper to be printed, spread on a table or floor, are to be rubbed over with the colour, properly tempered by means of a large brush. The colour passing over the whole is consequently spread on those parts of the paper where the cloth or leather is cut away, and give the same effect as if laid on by a print. This is nevertheless only practicable in parts where there are only detached masses or spots of colours; for where there are small continued lines, or parts that run one into another, it is difficult to preserve the connection or continuity of the parts of the cloth, or to keep the smaller corners close down to the paper; and therefore, in such cases, prints are preferable. Stencilling is indeed a cheaper method of ridding coarse work than printing; but without such extraordinary attention and trouble as render it equally difficult with printing, it is far less beautiful and exact in the effect. For the outline of the spots of colour want that sharpness and regularity that are given by prints, besides the frequent extra lineations, or deviations from the just figure, which happens by the original misplacing of the stencils, or the shifting the place of them during the operation. Pencilling is only used in the case of nicer work, such as the better imitations of the India paper. It is performed in the same manner as other paintings in water or varnish. It is sometimes used only to fill the outlines already formed by printing, where the price of the colour, or the exactness of the manner in which it is required to be laid on, render the stencilling or printing it less proper; at other times it is used for forming or delineating some parts of the design, where a spirit of freedom and variety, not to be had in printed outlines, are desired to be had in the work. The paper designed for receiving the flock is first prepared with a varnish-ground with some proper colour, or by that of the paper itself. It is frequently practised to print some Mosaic, or other small running figure in colours, on the ground, before the flock be laid on; and it may be done with any pigment of the colour desired, tempered with varnish, and laid on by a print cut correspondently to that end. The method of laying on the flock is this: a wooden print being cut, as is above described, for laying on the colour in such

manner that the part of the design which is intended for the flock may project beyond the rest of the surface, the varnish is put on a block covered with leather or oil-cloth, and the print is to be used also in the same manner, to lay the varnish on all the parts where the flock is to be fixed. The sheet, thus prepared by the varnished impression, is then to be removed to another block or table, and to be strewn over with flock, which is afterwards to be gently compressed by a board, or some other flat body, to make the varnish take the better hold of it: and then the sheet is to be hung on a frame till the varnish be perfectly dry, at which time the superfluous part of flock is to be brushed off by a soft camel's-hair brush, and the proper flock will be found to adhere in a very strong manner. The method of preparing the flock is, by cutting woollen rags or pieces of cloth with the hand, by means of a large bill or chopping-knife; or by means of a machine worked by a horse-mill. There is a kind of counterfeit flock-paper, which, when well managed, has very much the same effect to the eye as the real, though done with less expense. The manner of making this sort is, by laying a ground of varnish on the paper, and, having afterwards printed the design of the flock in varnish, in the same manner as for the true; instead of the flock, some pigment, or dry colour, of the same hue with the flock required by the design, but somewhat of a darker shade, being well powdered, is strewn on the printed varnish, and produces nearly the same appearance.

Mr. John Middleton lately communicated some improvements in the printing of paper-hangings to the Society of Arts. They are intended to facilitate the conveyance of the paper over the printing-table, and to give a greater pressure than usual to the block, when printing dark grounds.

To facilitate the conveyance of the paper, two cords 36 feet long are stretched from the printers table to the other end of the room through rings, where they are kept tight by a weight appended to their extremities. The paper to be printed is rolled up on a wooden roller at one side of the table, and its ends brought across the table and fastened between two flat ledges that are connected at one end by an hinge, and at the other by a sliding ring; these ledges slide along the two cords on pulleys placed at each end of them, and serve to draw forward the paper as it is printed; from the middle of these ledges a cord proceeds to the end of the room, between the other two cords where it passes over a pulley, and thence returns to a roller under the table; the circle of this roller extends beyond the table, and there has a wheel fastened to it, from which projects three pins, each about four inches long, by pressing on which with the foot, the wheel is turned round, and with it the roller; by means of which the paper is drawn forward on the cords a space corresponding to the distance between the pins in the wheel.

The contrivance for giving an extraordinary pressure to the block, consists of a long and a short lever projecting from one side of an axle placed over head above the printers table, which levers and the matters supported by them are balanced by a weight appended to an arm which proceeds from the other side of the axle; from the long lever a cord falls to the ground where a treadle is attached to it: a long pole is jointed to the end of the short lever, and descends from it directly over the place of the block, on which it is made to press by standing on the treadle whenever it is

thought proper, and is put out of the way when not wanted, by placing the end of it behind a piece of wood which projects upwards from the back of the table for that purpose.

PAPER. a. Any thing slight or thin (*Burnet*).

To PAPER. v. a. (from the noun.) To register (*Shakspeare*).

PAPERMAKER. s. (*paper and make*.) One who makes paper.

PAPERMILL. s. (*paper and mill*.) A mill in which rags are ground for paper (*Shaks.*).

PAPER-MONEY, bank-bills.

PAPER-OFFICE, an office in the palace of Whitehall, in which all the public writings, matters of state and council, proclamations, letters, intelligences, negotiations abroad, and generally all dispatches that pass through the offices of the secretaries of state, are lodged by way of library.

PAPE'SCENT. a. Containing pap; inclinal to pap (*Arbutnot*).

PAPHIA, a surname of Venus, because the goddess was worshipped at Paphos, in the island of Cyprus.

PAPHLAGONIA, a country of Asia Minor, situate at the west of the river Halys, by which it was separated from the Cappadocians. It was divided on the west from the Bithynians by the river Parthenius.

PAPHOS, a famous city of the island of Cyprus. The goddess of beauty was particularly worshipped there, and her altars, though 100 in number, daily smoked with Arabian frankincense. The inhabitants were very lascivious, and the young virgins were permitted by the laws of the place to get a dowry by prostitution.

PAPIAS, bishop of Hierapolis, a city of Phrygia, in Asia Minor, was, according to Irenæus, the disciple of St. John the Evangelist. He introduced the doctrine of the Millennium, or the temporal reign of Christ on the earth for 1000 years.

PAPIER MACHÉ, is a substance made of cuttings of white or brown paper, boiled in water, and beaten in a mortar till they are reduced into a kind of paste, and then boiled with a solution of gum-arabic or of size, to give tenacity to the paste, which is afterwards formed into different toys, &c. by pressing it into oiled moulds. When dry, it is done over with a mixture of size and lamp-black, and afterwards varnished. The black varnish for these toys, according to Dr. Lewis, is prepared as follows. Some colophony, or turpentine, boiled down till it becomes black and friable, is melted in a glazed earthen vessel, and thrice as much amber in fine powder sprinkled in by degrees, with the addition of a little spirit or oil of turpentine now and then: when the amber is melted, sprinkle in the same quantity of sarcocolla, continuing to stir them, and to add more spirit of turpentine, till the whole becomes fluid; then strain out the clear through a coarse hair bag, pressing it gently between hot boards. This varnish, mixed with ivory-black in fine powder, is applied in a hot room

PAPILIO.

on the dried paper paste, which is then set in a gently heated oven, next day in a hotter oven, and the third day in a very hot one, and let stand each time till the oven grows cold.

PAPILIO. Butterfly. In zoology, a genus of the class insecta, order lepidoptera. Antennas growing thicker towards the tip and generally ending in a knob; wings, when sitting, erect, the edges meeting together over the abdomen: flies in the day-time. Very nearly twelve hundred species scattered over the globe; of which nearly seventy are natives of our own country.

This genus is so extremely voluminous, that it has been judged necessary by every entomologist to divide it into sections and subsections. Fabricius has, upon this subject, been not only more minute, but more fortunate than Linnæus. We shall therefore copy the arrangement of both.

LINNEAN DIVISION.

- A. Equites. Upper wings longer from the posterior angle to the tip than to the base; antennæ often filiform.
 - a. Trojans. Generally black; with sanguineous spots on the breast.
 - ♂. Greeks. Breast without sanguineous spots; an ocellate spot at the angle of the tail.
 - † Wings without bands.
 - †† Wings with bands.
- B. Heleconii. Wings narrow, entire, often naked or semitransparent; the upper ones oblong, the lower ones very short.
- C. Danai. Wings very entire.
- a. Candidi. Whitish wings.
- ♂. Festivi. Variegated wings.
- D. Nymphales. Wings denticulate.
- a. Gemmati. Wings with ocellate spots.
 - † On all the wings.
 - †† On the upper wings only.
 - ††† On the lower wings only.
- ♂. Phalerati. Wings without ocellate spots.
- E. Plebeji. Small: the larvæ often contracted.
 - a. Rurales. Wings with obscure spots.
 - ♂. Urbicolæ. Wings mostly with transparent spots.

FABRICIAN DIVISION.

- I. Papilio. Feelers reflected; tongue exerted, spiral; antennæ thicker towards the tip.
 - A. Upper wings longer from the posterior angle to the tip than to the base.
 - a. Equites. Lower wings cut to admit a free motion of the abdomen.
 - † Trojans. Generally black, with sanguineous spots on the breast.
 - †† Greeks. Breast without sanguineous spots; an ocellate spot at the angle of the tail.
 - ♂. Satyri. Lower wings dilated on the inner margin into a groove for the reception of the abdomen.
 - B. Heleconii. Wings oblong, the lower ones short and rounded.

- C. Parnassii. Wings rounded, entirely, or partially naked.
- D. Wings rounded.
 - a. Festivi. Lower wings distant at the inner edge.
 - ♂. Danai. Lower wings meeting at the inner edge and covering the base of the abdomen.
 - y. Nymphales. Lower wings forming a groove for the reception of the abdomen.
- II. Hesperia. Feelers compressed and hairy at the base, the tip cylindrical and naked; club of the antennæ oblong and often hooked.
 - a. Rurales. Wings with obscure spots.
 - ♂. Urbicolæ. Wings with mostly transparent spots.

These insects feed on the nectar of flowers, and the moisture exuding from trees; the larvæ are active, and furnished with tentacles and sixteen feet; they are sometimes spinous and sometimes naked, and feed voraciously on the leaves of various plants; the pupæ is naked, quiescent, and attached to trees or other substances by filaments either from the tip or the middle.

There is no tribe of insects that has been more accurately examined, or whose history has been so fully detailed. Reaumur and Fabricius are the naturalists to whom we are chiefly indebted for our knowledge of its extensive numbers, and very curious powers.

Some of the species frequently cast their skin, besides undergoing those more considerable transformations which introduce them into a new sphere of action. Before the fresh tunic is developed, the outer skin is seen to wither and lose the vivacity of its colours, owing to the new coat which already covers the animal beneath, and intercepts the juices which formerly circulated through it: after some efforts this dried covering is rent towards the back part of the head, where the fresh skin appears; and through this aperture the worm makes his escape, leaving his spoils behind.

After undergoing several changes of this kind, the insect prepares to undergo another and still more considerable, which is to introduce it into the state of a chrysalid, deprived of almost all motion, and incapable of taking food. This change is effected nearly in the same manner as the foregoing; but in some it is very long in being accomplished. Several species of the butterfly worm construct in a very ingenious manner a coque, or cocoon, or nut of silk, into which they enter before their transformation, and in which they continue for nine months, without food, before their metamorphoses be accomplished. During this long period they are apparently inanimate, and take no nutriment.

Various substances enter into the composition of the habitations constructed by these animals before their metamorphoses: some are of silk; in some, silk is combined with other matters; several kinds construct no habitation, but are protected by a crustaceous shell, formed by a glutinous substance, exuding from their

PAPILIO.

bodies: some are suspended vertically, while others hang horizontally by a thread which surrounds the middle of the body.

The external form of the chrysalids varies according to the species of butterfly that inhabits them; in all, however, there are apertures opposite to the thorax, by which respiration is carried on during the whole period of their inactive state. After the appointed time, when the animal has acquired sufficient vigour, the shell is broken, which at once constituted the grave of the caterpillar and the cradle of the butterfly: the down already grown upon the insect has completely separated it on all sides from the shell, which by the action of the head is broken opposite to that part, and affords free egress to the prisoner it so long confined.

The wings of the butterfly, on its first appearance, are closely folded; but by the help of a liquor constantly circulating through them they are soon expanded, and sufficiently hardened, by the action of the air, to endure the efforts of flying. It is then that the insect enters upon a more enlarged sphere of action, with increased powers: he ranges from flower to flower, darting his rostrum into their nectaries for the delicious stores they contain. Then too in the full possession of every faculty granted to his race, he prepares to multiply and perpetuate it.

This last and most considerable metamorphosis is attended with a greater change in the economy of the animal than any of the preceding; for not only the skin, but the teeth, jaws, and even the cranium, are left behind. The large artery which passes along the body may be considered as a succession of different hearts employed in circulating the blood, which is at that important æra observed to flow in a different direction from what it did before, like the fetus of a quadruped after birth: formerly it circulated from the extremity to the head; it now pursues a course directly opposite.

The quantity of food taken by these animals in their last state is comparatively small to what they antecedently devoured. For a short time after their appearance on the wing, their excrements are voided in a greater quantity, and are red like blood; this is, perhaps, the remains of that food which they contained before their late change. The appearance of this substance on the surface of the earth has at different times been regarded as portentous of some heavy calamity, being supposed to be blood that had dropt from the clouds.

Some of these animals are gregarious, and live in society during every stage of their existence; others live in that state during one period of their existence only. The duration of their life is various, according to the weather; its warmth accelerates every step of their progress, and its cold retards all their developments: a worm produced in an early period of the summer lives only for three months, while the same species, if hatched a little later in the season, lives another year; hence Reaumur has devised a method of prolonging

the lives of these animals greatly beyond their natural course.

The butterflies of every species are extremely prolific; a single female at one birth produces several hundred eggs: and one of the most wonderful particulars in the history of these insects, is the precaution with which they provide for the security of their young; some species tear off even the down from their own bodies to supply them with a covering.

Various insects prey upon the butterfly, or hasten the approach of its dissolution. One or two species of ichneumon perforates the body of the insect while a caterpillar, and there deposits its eggs; and, although the caterpillar continues to live, and is metamorphosed into a chrysalid, no butterfly is produced from it, those internal parts that were essential to its perfection being consumed by the larves of the ichneumon. From the great fecundity and variety of the insects of this genus they probably would soon cover the surface of the earth, did not nature provide a bar to their increase by multiplying their enemies: hence they are destined to become the food of a great number of animals of various kinds, some of which swallow them entirely, others macerate their bodies; while many accomplish their destruction by gradually sucking their juices. A single pair of sparrows, in order to supply themselves and their young, may destroy, it has been calculated, three thousand three hundred and sixty butterflies in one week.

The variety and richness of the colours that adorn the greater part of this tribe, have made it an object of especial research by painters as well as by naturalists. In general the tropical climates that heighten the colours both in the plumage of birds, and the scales of fishes, offer the most gaudy specimens of the butterfly.—We have only space to detail an example or two.

1. *P. Priamus*. Wings indented, silky, upper pair above green with a black disk and edge, lower ones with from four to six black spots; thorax black, with three green spots: this insect measures more than six inches from wing's end to wing's end; the black is of a velvet softness, the silky wings peculiarly lustrous, and the green of the upper pair of the most beautiful grass hue. Linnæus regarded it as the most superb of the whole papilionaceous tribe. It is a native of Amboyna, and very rare. It arranges under the section Equites, Troes, or Trojans.

2. *P. Hector*. Wings tailed black, both surfaces of the same colour, the upper pair with an interrupted white band, lower ones with numerous crimson spots: head and upper margin of the thorax red. This, also, as its specific name imports, belongs to the same section, and is very appropriately named. It is a native of Asia, and highly beautiful.

3. *P. machaon*. Wings tailed, both surfaces alike, yellow with a brown border, in which are yellow lunulæ; angle of the tail fulvous. This is one of the very few of the section Equites that are natives of our own country. It

is commonly known among collectors of this tribe of insects by the name of the *swallow-tailed* butterfly, and is a very elegant species. It is generally found in the month of August on umbelliferous plants. The larve is solitary and glabrous; furnished with tentacles, annulate with black and green, and dotted with red; the pupe is yellowish.

4. *P. Apollo*. Wings entire, white, spotted with black; lower ones with four eyes above, and six beneath. This is also a beautiful insect, somewhat larger than our great cabbage butterfly; it inhabits Europe, and has been occasionally found in our own gardens. It belongs to the section *Parnassii*. The larve is solitary, furnished with tentacles, silky, black, with two red dots on the segment on each side; pupe slightly folliculate, ovate, blueish, with red dots on each side on the fore-part.

5. *P. Brassicæ*. Common large white, or cabbage butterfly. Wings rounded entire, white; tip of the upper pair brown, and (in the male) two brown spots. Inhabits Europe, and is known to every one. Larve cinereous, dotted with black, with three sulphur lines; tail black; pupe pale-green, with three yellow lines, and three globular segments. A species of the *Danai* section.

6. *P. Io*. Peacock butterfly. Wings angular, indented, fulvous, spotted with black, and a large blue eye in each. An elegant specimen, inhabiting Europe and our own country. It belongs to the division *nymphales*. The larve is spinous, black, dotted with white, legs ferruginous: pupe ten-toothed, green with gold-dots, bifid behind.

7. *P. Iris*. Wings indented, brown with a blue gloss, and whitish interrupted band on each side; all with a single eye; the eyes on the upper pair above blind. Found in our own gardens and in Europe generally: belongs also to the *nymphales*. The male is spotted with white on the upper wings, and is without the eye. The larve is green with two horns, and oblique pale lines; pupe greenish, bifid at the tip.

PAPILIONACEA. (*papilio*, a butterfly.)

In botany, a papilionaceous or butterfly-shaped corol.—Irregular, and usually four-petalled. The lower petal is shaped like a boat, and is called *carina* or *keel*: the upper petal, which spreads and rises upwards, is called *vexillum*, standard or banner: the two side ones stand singly, being separated by the keel, and are called *alæ*, the wings. The keel is sometimes split, and then this corol is properly five-petalled. These flowers form a natural class, called *papilionaceæ*; and are to be found in the fifty-fifth order of Linnæus's *Fragments*, and in the thirty-second of his *Natural Orders*. They are chiefly comprehended within the order *decandria*, of the class *diadelphia*, in the *Artificial System*. This is one of *Tournefort's* classes; and is the same with the *leguminosæ* of Ray and other authors. The pea being the most obvious of these, some call them *pea-blossomed* flowers.

PAPILLA. (*papilla*.) The nipple of the breast. See **NIPPLE**.

PAPILLÆ. This term is applied by anatomists to the fine terminations of nerves, &c. as the nervous papillæ of the tongue, skin, &c.

PAPILLARIS HERBA. See **LAMPANA**.

PAPILLARY. **PAPILLOUS.** *a.* (from *papilla*, Latin.) Having emulgent vessels, or resemblances of paps (*Derham*).

PAPIRIUS. This name was common to several eminent Romans, the most remarkable of whom are the following:—Carbo, a Roman consul, who undertook the defence of *Opimius*, who was accused of condemning and putting to death a number of citizens on mount *Aventinus* without the form of a trial. His client was acquitted.—2. A dictator, who ordered his master of horse to be put to death, because he had fought and conquered the enemies of the republic without his consent. The people interfered, and the dictator pardoned him. *Cursor* made war against the *Sabines*, and conquered them, and also triumphed over the *Samnites*. His great severity displeased the people. He flourished about 320 years before the Christian era.—3. Carbo, a friend of *Cinna* and *Marius*. He raised cabals against *Sylla* and *Pompey*, and was at last put to death by order of *Pompey*, after he had rendered himself odious by a tyrannical consulship, and after he had been proscribed by *Sylla*. 4. *Maso*, a consul who conquered *Sardinia* and *Corsica*, and reduced them into the form of a province. At his return to Rome, he was refused a triumph, upon which he introduced a triumphal procession, and walked with his victorious army to the capitol, wearing a crown of myrtle on his head. His example was afterwards followed by such generals as were refused a triumph by the Roman senate.

PAPISTS, are those who believe the pope or bishop of Rome to be the supreme pastor of the universal church, who profess to believe all the articles of pope *Pius's* creed, and who promise implicit obedience to the edicts of the church, especially the decrees of the council of *Trent*. See **POPE**, **TRENT**, and **NONCONFORMIST**.

PAPISTICAL. *a.* (from *papist*.) Popish; adherent to popery (*Whitgift*).

PAPISTRY. *s.* (from *papist*.) Popery; the doctrine of the *Romish* church (*Whitgift*).

PAPOUI (St.), a town of France, in the department of *Aude*, seated on the *Lembe*, eight miles E. of *Castlenaudary*, and 35 S.E. of *Toulouse*. Lon. 2. 10 E. Lat. 43. 21 N.

PAPPENHEIM, a town of *Franconia*, capital of a county of the same name, with a castle, where the count resides. It is seated near the *Altmal*, 17 miles N.W. of *Neuburg*, and 32 S. *Nuremburg*. Lon. 10. 51 E. Lat. 48. 58 N.

PAPPOPHORUM. In botany, a genus of the class *triandria*, order *digynia*. Calyx two-valved, two-flowered: corol two-valved, many-awned. One species, a native of *South America*, with branched culm; erect panicle; calyx from two to four-flowered.

Phalana.
P. Mori. Silk-worm Moth.

Papilio.

P. Apollo.
Apollo or *Butterfly.*

P. Pieris.
Pierian or *Butterfly.*

Pinus.

natural size.

magnified.

Pinus pulsator; or fatidicus Death-watch.

P A P

PAPPUS, a very eminent Greek mathematician of Alexandria towards the latter part of the 4th century, particularly mentioned by Suidas, who says he flourished under the emperor Theodosius the Great, who reigned from the year 379 to 395 of Christ. His writings shew him to have been a consummate mathematician. Many of his works are lost, or at least have not yet been discovered. Suidas mentions several of his works, as also Vossius de Scientiis Mathematicis. The principal of these are, his Mathematical Collections, in 8 books, the first and part of the second being lost. He wrote also a Commentary upon Ptolemy's Almagest; an Universal Chorography; A Description of the Rivers of Libya; a Treatise of Military Engines; Commentaries upon Aristarchus of Samos, concerning the Magnitude and Distance of the Sun and Moon; &c. Of these there have been published, the Mathematical Collections, in a Latin translation, with a large Commentary, by Commandine, in folio, 1588; and a second edition of the same in 1660. In 1644, Mersenne exhibited a kind of abridgment of them in his Synopsis Mathematica, in 4to: but this contains only such propositions as could be understood without figures. In 1655, Meibomius gave some of the Lemmata of the 7th book, in his Dialogue upon Proportions. In 1688, Dr. Wallis printed the last twelve propositions of the 2d book, at the end of his Aristarchus Samius. In 1703, Dr. David Gregory gave part of the preface of the 7th book in the Prolegomena to his Euclid. And in 1706, Dr. Halley gave that preface entire, in the beginning of his Apollonius.

The contents of his principal work, the Mathematical Collections, are exceedingly curious. The only account of them in the English language, with which we are acquainted, is given by Dr. Hutton in his valuable Mathematical Dictionary, to which we refer the inquisitive reader.

PAPPUS, (*pappus*.) The hair on the mid-
dle of the chin. See **CAPILLUS**.

PAPPUS, in botany, (anciently put for *senex*, an old man, whence it was applied to the down on the seed of thistles, &c. being like the gray hairs of old age.) Commonly translated down: but hence arises a confusion between this and the lanugo or tomentum on the surface of leaves, &c. which we usually call down. Pliny, however, will justify us in some degree: for speaking of the cactus (l. 21, c. 16.) he says—*Semen ei lanuginis, quam pappum vocant*. Some endeavour to get rid of this difficulty by translating *pappus*, the feather, but not successfully; for we cannot say a hairy feather and a feathered feather. The French name is *aigrette*. The ladies have adopted this term, and Mr. Martyn proposes to follow their example: if we call it seed-down, all confusion will be avoided.

Linnéus explains it to be—*corona* (seminis) *pennacea pilosave volitans*, a feathery or hairy flying crown to the seed. The first he calls

P A R

pappus plumosus; and indeed it resembles a feather in its structure: the second, *capillaris pilosus* or *simplex*; having the hairs undivided. (See **CAPILLARY**.) This crown is either placed immediately on the seed, and is then said to be *sesilis* or sessile; or else there is a thread interposed between it and the seed, which Linnéus calls *stipes*, and then it is said to be *stipitatus*, stipitate or stiped. This down or egret is one of nature's most obvious means of dispersing seeds to a considerable distance.

PAPPY, *a*. (from *pap*.) Soft; succulent; easily divided (*Burnet*).

PAPULÆ. (dim. of *pappa*, a dug or nipple.) In medicine, very small and accumulated elevations of the cuticle, with an inflamed base, not containing a fluid, nor tending to suppuration. The duration of papulæ is uncertain, but they terminate for the most part in scurf.

PAPULOSE LEAF. (*papula*, a pimple.) In botany, a pimplily, bladdery or blistered leaf. *Tectum punctis vesicularibus*. Covered with little blisters.

PAPYRUS. Paper-rush. See **CYPERUS**.

PAR, *s*. (Latin.) State of equality; equivalence; equal value (*Locke*).

PAR VAGUM. (*par*, *paris*, a pair.) In neurology, the eighth pair of nerves. They arise from the corpora olivaria of the medulla oblongata, and proceed into the neck, thorax, and abdomen. In the neck the *par vagum* gives off two branches, the lingual and superior laryngeal; and in the thorax four branches, the recurrent laryngeal, the cardiac, the pulmonary, and the œsophageal plexuses. At length the trunks of the *nervi vagi*, adjacent to the mediastinum, run into the stomach, and there form the stomachic plexus, which branches to the abdominal plexuses.

PARA. (*para*.) A preposition commencing many compound terms in medicine, and the collateral branches of science, and implying proximity in general, but more usually a proximity with inferiority—nearly, almost, something less or below: as *pareplegia*, a partial palsy; *paranoia*, defective or diminished judgment, alienation of mind; *paronychia*, an inflammation near the finger-nail.

PARABLE, a fable or allegorical instruction, founded on something real or apparent in nature or history, from which a moral is drawn by comparing it with something in which the people are more immediately concerned; such are the parables of Dives and Lazarus, of the Prodigal Son, of the Ten Virgins, &c. Dr. Blair observes, that "of parables, which form a part of allegory, the prophetic writings are full; and if to us they sometimes appear obscure, we must remember, that in those early times it was universally the mode throughout all the eastern nations to convey sacred truths under mysterious figures and representations."

PARABOLA, in geometry, a figure formed by the section of a cone, when cut by a plane parallel to a plane touching the slant side

of the cone. It is expressed by the equation $ax=y^2$, where a is the parameter, x the abscissa, y the corresponding semi-ordinate. See CONIC SECTIONS, and CURVES.

PARABOLAS OF THE HIGHER KINDS, are algebraic curves, defined by the general equation $a^{n-1}x=y^n$; that is, either $a^2x=y^3$, or $a^3x=y^4$, or $a^4x=y^5$, &c.

Some call these by the name of paraboloids; and in particular, if $a^2x=y^3$, they call it a cubical paraboloid; if $a^3x=y^4$, they call it a biquadratical paraboloid, or a sursolid paraboloid. In respect of these, the parabola of the first kind, above explained, they call the apollonian, or quadratic parabola.

Those curves are also to be referred to parabolas, that are expressed by the general equation $a^{m-1}x=y^m$, where the indices of the quantities on each side are equal, as before; and these are called semi-parabolas: as $ax^2=y^3$ the semi-cubical parabola; or $ax^3=y^4$ the semi-biquadratical parabola, &c.

They are all comprehended under the more general equation $a^m x = y^{m+n}$, where the two indices on one side are still equal to the index on the other side of the equation; which include both the former kinds of equations, as well as such as these following ones, $a^2x^2=y^4$, or $a^2x^3=y^5$, or $a^4x^3=y^7$, &c.

PARABOLA (Cartesian), is a curve of the 2d order expressed by the equation $xy=ax^3+bx^2+cx+d$, containing four infinite legs.

PARABOLA (Diverging), is a name given by Newton to a species of five different lines of the third order, expressed by the equation $y^2=ax^3+bx^2+cx+d$.

Of these the fifth is a parabola with two diverging legs, forming at their meeting a cusp or double point, being the case when the equation $0=ax^3+bx^2+cx+d$ has three equal roots; so that $py^2=x^3$ is the most simple equation of this curve, which indeed is the semi-cubical, or neilian parabola.

If a solid generated by the rotation of a semi-cubical parabola, about its axis, be cut by a plane, each of these five parabolas will be exhibited by its sections. For, when the cutting plane is oblique to the axis, but falls below it, the section is a diverging parabola, with an oval at its head. When oblique to the axis, but passes through the vertex, the section is a diverging parabola, having an infinitely small oval at its head. When the cutting is oblique to the axis, falls below it, and at the same time touches the curve surface of the solid, as well as cuts it, the section is a diverging parabola, with a nodus or knot. When the cutting plane falls above the vertex, either parallel or oblique to the axis, the section is a pure diverging parabola. And lastly when the cutting plane passes through the axis, the section is the semi-cubical parabola from which the solid was generated.

PARABOLIC ASYMPTOTE, is used for

a parabolic line approaching to a curve, so that they never meet; yet by producing both indefinitely, their distance from each other becomes less than any given line.

There may be as many different kinds of these asymptotes as there are parabolas of different orders. When a curve has a common parabola for its asymptote, the ratio of the subtangent to the absciss approaches continually to the ratio of 2 to 1, when the axis of the parabola coincides with the base; but this ratio of the subtangent to the absciss approaches to that of 1 to 2, when the axis is perpendicular to the base. And by observing the limit to which the ratio of the subtangent and absciss approaches, parabolic asymptotes of various kinds may be discovered. See MACLAURIN'S FLUXIONS, art. 337.

PARABOLIC CONOID, is a solid generated by the rotation of a parabola about its axis.

This solid is equal to half its circumscribed cylinder; and therefore if the base be multiplied by the height, half the product will be the solid content.

PARABOLIC PYRAMOID, is a solid figure thus named by Dr. Wallis, from its genesis, or formation, which is thus: let all the squares of the ordinates of a parabola be conceived to be so placed, that the axis shall pass perpendicularly through all their centres; then the aggregate of all these planes will form the parabolic pyramidoid.

This figure is equal to half its circumscribed parallelepipedon. And therefore the solid content is found by multiplying the base by the altitude, and taking half the product; or the one of these by half the other.

PARABOLIC SPACE, is the space or area included by the curve line and base or double ordinate of the parabola. The area of this space, as is proved by writers on the Parabola, is $\frac{2}{3}$ of its circumscribed parallelogram; which is its quadrature, and which was first found out by ARCHIMEDES, though some say by PYTHAGORAS.

PARABOLIC SPINDLE, is a solid figure conceived to be formed by the rotation of a parabola about its base or double ordinate.

This solid is equal to $\frac{8}{15}$ of its circumscribed cylinder.

PARABOLIC SPIRAL. See HELICOID PARABOLA.

PARABOLIC LEAF. In botany. Cujus diameter longitudinalis superat transversalem, & a basi sursum angustatur in semiovatum. Philos. Bot. Having the longitudinal diameter exceeding the transverse one, and narrowing from the base upwards into a half ovate. In Delin. Pl. it is not so fully expressed—versus apicem sensim angustius rotundatum. Rounded gradually towards the top into a narrower form.

PARABOLICAL. PARABOL'IC. *a.* (parabolique, Fr. from *parable*.) 1. Expressed by parable or similitude (Brown). 2. (from *parabola*.) Having the nature or form of a parabola (Ray).

PARABOLICALLY. *ad.* (from *parabolic.*) 1. By way of *parabole* or similitude (*Brown*). 2. In the form of a parabola.

PARABOLIFORM CURVES, a name sometimes given to the parabolas of the higher orders.

PARABOLOIDES, parabolas of the higher orders.

PARABOSCO (*Jerome*), an Italian dramatic writer of the 16th century: he was the author of several comedies in prose; and some novels in the style of Boccaccio, printed in 8vo. at Venice, 1558, under the title of *Diporti di Girolemo Parabosco*.

PARACELSUS, a celebrated chemist, was born at Einsfiden, in Switzerland, in 1493. His father was the natural son of a master of the Teutonic order, who possessing a good library, was enabled to assist the genius of his son in his early pursuits of learning. His first studies were devoted to physic and surgery; but he was captivated with, and ran into all the extravagances of alchemy. Making a visit to the mines, in Hungary, he had an opportunity of improving his knowledge in metallic chemistry. He went from Germany to Russia, was taken prisoner on the frontiers by the Tartars, and carried before the Cham, who valued his learning, and honoured him by choosing him to accompany his son, the prince, on an embassy to Constantinople, where, as he pretends, he was admitted to the secret of the philosopher's stone. His practice was obscured by a kind of empirical mystery; but his celebrity was increased by a daring use of the two powerful remedies mercury and opium; no wonder therefore that he was considered as an oracle in the venereal disease. The circumstance of his recovering the famous printer Frobenius of Basil, from a latent disorder, greatly increased his reputation, for he read professional lectures in that city. Notwithstanding Paracelsus vaunted of having discovered the philosopher's stone, he was compelled to sue the canon of Lichtenfels, for the amount of his bill; and although he affirmed that a man might live to the age of Methusalem, by the use of his elixir, he died at the age of 48. He gloried in overturning the system of Galen, though his own contained more absurdities than those of all the writers before him. (*Watkins*).

PARACENTESIS. (*paracentesis*, *παράκενσις*; from *παράκεναι*, to pierce through.) The operation of tapping to evacuate the water in ascites, dropsy of the ovary, uterus, &c.

PARACENTRIC MOTION, in astronomy, a term used for so much as a revolving planet approaches nearer to, or recedes farther from, the sun, or centre of attraction.

PARACHUTE, a kind of large and strong umbrella, contrived to break a person's fall from an air-balloon, should any accident happen to the balloon at a high elevation. This contrivance was first thought of by Blanchard, who at different times, by means of the parachute, let fall from his balloon dogs and other animals. He ventured even to descend in this

manner himself; but, whether from the bad construction of his parachute, or from falling among trees, he had the misfortune to break one of his legs. *Citizen* Garnerin, as he chooses to be called, was more successful. On the 21st of October 1797, he ascended from the garden de Mauisseux at half past five in the evening; between the balloon and the car, in which he sat, was placed the parachute, half opened, and forming a kind of tent over the aerial traveller; and when the whole apparatus was at a considerable height, he separated the parachute and car from the balloon. The parachute unfolding itself, was, by his weight and that of the car, drawn of course towards the earth. Its fall was at first rapid and vertical; but soon afterwards it exhibited a kind of balancing or vibration, and a rotation gradually increasing, which might be compared with that of a leaf falling from a tree. The aeronaut, however, reached the ground unhurt. See *ÆROSTATIA*.

This parachute was of cloth, and its diameter, when unfolded, about twenty-five feet. To use such instruments with success, it is necessary that the car be suspended at a considerable distance from the parachute, so as that the centre of gravity of the whole shall be vertically below the centre of resistance made by the air to the descent of the parachute; for if the car be otherwise placed, it is evident that the parachute will incline to one side, descend obliquely, oscillate, and the smallest irregularity in its figure will cause it to turn round its vertical axis.

PARACLET, the comforter, a name given the Holy Spirit, in the New Testament.

PARACOE. (from *παρά*, *dim.* and *ακουω*, to hear.) A dulness of hearing.

PARACUSIS. (*paracusis*, *παράκουσις*; from *παρά*, wrong, and *ακουω*, to hear.) Hearing depraved. Singing in the ears. A genus of disease in the class locales, and order dysæsthesiæ of Cullen: species, 1. *Paracusis imperfecta*, when existing sounds are not heard as usual. —2. *Paracusis imaginaria*, when imaginary sounds are heard.

PARADE. *s.* (*parade*, French.) 1. Show; ostentation (*Glanville*). 2. Procession; assembly of pomp (*Swift*). 3. Military order (*Milton*). 4. Place where troops draw up to do duty and mount guard. 5. Guard; posture of defence (*Locke*).

PARADIGM. *s.* (*παράδειγμα*.) Example.

PARADISE. *s.* (*παράδεισος*.) 1. The blissful regions, in which the first pair was placed (*Milton*). 2. Any place of felicity (*Shaks.*).

PARADISE is principally used for the garden of Eden, in which Adam and Eve were placed immediately upon their creation. As to this terrestrial paradise, there have been many inquiries about its situation. It has been placed in the third heaven, in the orb of the moon, in the moon itself, in the middle region of the air, above the earth, under the earth, in the place possessed by the Caspian sea, and under the arctic pole. The learned Huetius places it upon the river that is produced by the

conjunction of the Tigris and Euphrates, now called the river of the Arabs, between this conjunction and the division made by the same river before it falls into the Persian sea. Other geographers have placed it in Armenia, between the sources of the Tigris, the Euphrates, the Araxis, and the Phasis, which they suppose to be the four rivers described by Moses. But concerning the exact place we must necessarily be very uncertain, if indeed it can be thought at all to exist at present, considering the many changes which have taken place on the surface of the earth since the creation.

PARADISE (Bird of). See PARADISEA.

PARADISE (Tree of). See MUSA.

PARADISACAL. *a.* (from *paradise*.) Suited to paradise; making paradise (*Burnet*).

PARADISEA. Bird of paradise. In zoology, a genus of the class aves, order picæ. Bill covered with a belt of downy feathers at the base; feathers of the sides very long; two of the tail feathers naked. Twelve species, inhabitants of New Guinea or the Papuan Islands, or islands of the Indian ocean. The following are chiefly entitled to notice.

1. *P. apoda*. Greater paradise bird. Chestnut; neck beneath green gold; feathers on the sides longer than the body; two middle tail-feathers long, bristly.

Another variety, of smaller size; body above yellow; feathers on the sides yellowish white; the two long naked tail-feathers straight and tapering to the tip; the tail, as it is improperly called, is nothing more than the long feathers of the back and flanks. Inhabits the islands near New Guinea, and in the rainy season returns back to New Guinea; feeds on the larger moths and butterflies; flies in flocks, with a leader at the head, all making a noise like the thrush.

Concerning this bird the wild and most improbable fictions have been propagated. It has been said to be of divine origin, and its natural habitation to be the region of the Mosaic paradise.

It was formerly believed by the credulous and ignorant, the most numerous class of men, that it lived alone upon the air and the dew; that it had no entrails, nor feet; but remained perpetually floating upon the air, while sleeping, as well as while awake; while hatching and laying, as well as while procreating its young. Instead of a stomach and intestines, which, to so extraordinary a feeder, would have been useless, the cavity of its abdomen was said to be filled with fat. The hunters who procure and sell these birds cut off their legs, and take away their entrails, the better to preserve and carry them; and perhaps too with a view to perpetuate the belief of those fables, which they have found so beneficial to their trade.

If any thing could give an air of probability to the perpetual flying of the bird of paradise, it might be its extraordinary lightness. A bird no larger than a thrush, swelled to an immense bulk by its feathers, is rendered specifically lighter than any other. About forty or

fifty long feathers spring from each side, below the wing, which, mingling with those of the tail, augment the apparent size of the animal, without adding hardly any thing to its weight. However well qualified to support itself in the air, the bird of paradise is unable to direct its flight either across or in opposition to the wind; and it is observed to prefer those places which are most sheltered.

In some parts of India the feathers of this bird bring a great price. They are extremely well suited for the ornaments of dress, both by their lightness and their lustre. About a century ago, they were employed for the same purposes for which those of the ostrich are now purchased. In India, however, they derive their principal value from certain miraculous virtues which the priests have ascribed to them, and which have procured the animal to which they belong the title of the bird of God, *Manuco-Dewata*, whence Buffon has coined the modern French name by which they are known, *manucode*. It is doubted by Dr. Forster whether this bird may not have been the phoenix of antiquity; and it is certain that independently of the divine origin ascribed to both of them, they have other resemblances of traditionary character, yet there is nothing in any of the delineations of Aristotle or Pliny that will fairly apply to the elegant and magnificent bird before us. It was first imported into Europe about the year 1522, by Anthony Pigafetta, who accompanied Magellan in his voyage round the world: in one solitary instance it was imported in a living state into our own country: it had, however, lost all its beautiful floating side-feathers, and did not long survive its arrival.

2. *P. regia*. King of the birds of paradise. Chestnut purple; beneath whitish; a green-gold band on the breast; two middle tail-feathers filiform, feathered, semilunar at the tip; feathers under the wings longer than the rest; tail short, truncate. Inhabits, like the last, the islands of the Indian ocean, and returns to New Guinea in the rainy season; is less than the last, and much rarer; solitary, and seeks for red berries; from five to seven inches long.

3. *P. tristis*. Grackle bird of paradise. A triangular, naked space behind the eyes; head and neck brown; body brownish; first quill feathers white from the base to the middle; tail-feathers, except the middle ones, tipped with white. Inhabits the Philippine islands; nine and a half inches long: feeds on fruit, insects, mice, and every kind of grain; builds twice a year in the forked branches of trees; eggs four; when young is easily tamed, and becomes docile and imitative. This bird has a great affinity in all its habits to the grackle genus, yet on account of the downy feathers at the base of the bill it belongs to the present tribe. See Nat. Hist. Pl. CLXV.

PARADISI GRANA. See GRANA PARADISI.

PARADOX. (*Παράδοξον*, formed from *παρά*, against, and *δόξα*, opinion.) In philosophy

Long-tailed Paradise Bird.

Cardinalis.

Le Molucca, from Linnæus.

proposition seemingly absurd, because contrary to the received opinions; but yet true in effect.

PARADOXICAL. *a.* (from *paradox.*) 1. Having the nature of paradox (Norris). 2. Inclined to new tenets, or notions contrary to received opinions.

PARADOXICALLY. *ad.* (from *paradox.*) In a paradoxical manner (Collier).

PARADOXICALNESS. *s.* (from *paradox.*) State of being paradoxical.

PARADOXOLOGY. *s.* (from *paradox.*) The use of paradoxes (Brown).

PARAGO, or PALAWAN, a large island in the Indian ocean, between the Philippines and Borneo, which has a king, tributary to Borneo. The Spaniards have a fort here.

PARAGOGE. *s.* (παράγωγη.) A figure whereby a letter or syllable is added at the end of a word, without adding any thing to the sense of it: as, *vast, vastly.*

PARAGON. *s.* (*paragon*, from *parage*, equality, old French.) 1. A model; a pattern; something supremely excellent (Shakespeare). 2. Companion; fellow (Spenser).

To PARAGON. *v. a.* (*paragonner*, Fr.) 1. To compare; to parallel (Sidney). 2. To equal; to be equal to (Shakespeare).

PARAGRAPH. *s.* (*paragraphe*, French, παράγραφη.) A distinct part of a discourse (Swift).

PARAGRAPHICALLY. *ad.* (from *paragraph.*) By paragraphs.

PARAGUA, the most westerly of the Philippine islands, about 180 miles in length and 20 in breadth. Lon. 117. 44 E. Lat. 10. 0 N.

PARAGUAY, a large country of South America, bounded on the N. by Amazonia, E. by Brazil, S. by Patagonia, and W. by Chili and Peru. It contains six provinces; namely, Paraguay Proper, Parana, Guaria, Uruguay, Tucuman, and La Plata. It has numerous lakes and rivers: of the latter, the three principal are the Parana, Paraguay, and Uruguay; the united streams of which form the celebrated Rio de la Plata. These rivers annually overflow their banks; and on their recess leave them enriched by the slime, that renders the soil extremely fertile. This vast country is far from being wholly subdued or planted by the Spaniards; many parts being still unknown. The principal province of which we have any knowledge is La Plata, from which the whole country is also called La Plata. This province, with all the adjacent parts, is one continued plain for several hundred miles; extremely fertile, and producing cotton in great abundance, tobacco, and the valuable herb called Paraguay, which is peculiar to this country, and the infusion of which is drank, in all the Spanish provinces of South America, instead of tea. Here are also a variety of fruits and very rich pastures; but the country is destitute of woods. Cattle, sheep, horses, and mules are in great abundance; of the latter many thousands are annually sent to Peru. In the mountains towards Tucuman, the condor, the

largest bird of the vulture tribe, is not unfrequent; and the ostrich is found in the wide plains. Several independent tribes of indigenes live in the interior, on the Rio Grande; one of them, called Abipons, are a warlike race, and by a novelty in American manners, chiefly cavalry, securing and taming the wild horses introduced by the Spaniards. In 1515, the Spaniards discovered this country by sailing up Rio de la Plata, and, in 1535, founded the town of Buenos Ayres. In 1580 the jesuits were admitted into these fertile regions, and in the next century founded the famous missions of Paraguay; which were a number of colonies, each governed by two jesuits, one of whom was rector, the other his curate; and in process of time, merely by the most wonderful address, they acquired an absolute dominion, both spiritual and temporal, over the natives. In 1757, Spain exchanged the colonies on the E. shore of the Uruguay for the Portuguese colony of St. Sacrament, which caused that river to become the boundary of the respective possessions of the two crowns. In 1767, the court expelled the jesuits, and the natives were put upon the same footing with the other Indians of the Spanish part of South America. Buenos Ayres is the capital.

PARAIBA, a province of Brasil, between those of Rio Grande and Tamarica. It abounds in sugar-canes, brasil-wood, tobacco, and cotton. The chief town is of the same name, and seated on the river Paraiba. The Dutch got possession of it in 1635, and fortified it with a slight rampart; but the Portuguese retook it soon after. Lon. 49. 53 W. Lat. 6. 50 S.

PARALEPSIS. (Παραλείψις.) In rhetoric, a pretence of omitting, or passing over a thing, and yet expressing it by the way.

PARALIPOMENA. (Παραλίπομενα.) A supplement of things omitted, or forgot, in some preceding work, or treatise.

The word is formed from the Greek *παράλειπω*, *prætermitto*, I pass by. Some authors use the word *subrelictum* instead of *paralipomenon*.

PARALLACTIC, in general, something relating to the parallax of heavenly bodies. See **PARALLAX**.

PARALLAX, in astronomy, is the difference between the places of any celestial object as seen from the surface, and from the centre of the earth at the same instant.

Let E in figure 2 of parallax given in plate 129 represent the centre of the earth, O the place of an observer on its surface, whose visible horizon is OH, and true horizon EF. Now let ZDT be a portion of a great circle in the heavens, and A the place of any object in the visible horizon; join EA, and produce it to C; then C is the true place of the object, and H is its apparent place, and the angle CAH is the parallax; or, because the object is in the horizon, it is called the horizontal parallax. But OAE, the angle which the earth's radius subtends at the object, is equal to CAH: hence the horizontal parallax of an object may be defined to be the angle which the earth's semi-diameter subtends at that object.

PARALLAX.

The whole effect of parallax is in a vertical direction: for the parallactic angle is in the plane passing through the observer and the earth's centre; which plane is necessarily perpendicular to the horizon, the earth being considered a sphere.

The more elevated an object is above the horizon, the less is the parallax, its distance from the earth's centre continuing the same. When the object is in the zenith, it has no parallax; but when in the horizon, its parallax is greatest. The horizontal parallax being given, the parallax at any given altitude may be found by the following rule:

To the logarithmic cosine of the given altitude, add the logarithmic sine of the horizontal parallax, the sum, rejecting 10 from the index, will be the logarithmic sine of the parallax in altitude.

Demonstration.—Let B be the place of an object; produce OB, ED to F; and D to G; then the angle BOZ will be the apparent altitude of the object, BEZ the true altitude, and OBE the parallax in altitude. Now in the triangle AOE,

$$R : \text{sine OAE} :: \text{EA} : \text{EO}.$$

And in the triangle OBE

$$\text{BE} (= \text{EA}) : \text{EO} :: \text{sine BOE} : \text{sine OBE}.$$

$$\text{Hence } R : \text{cosine BOA} :: \text{sine OAE} : \text{sine OBE}.$$

As the two last terms are generally small quantities, the arch may be substituted in place of its sine without any sensible error.

Example.—Let the apparent altitude of the moon's centre be $39^{\circ} 25'$, and the moon's horizontal parallax $56' 54''$. Required the parallax in altitude? Moon's apparent alt. $39^{\circ} 25'$ cosine 9.8879260
Moon's horizontal par. $56' 54''$ sine 8.2188186

Moon's par. in altitude $43' 57''$ sine 8.1067446

As the apparent place of an object is nearer the horizon than its true place, the parallax is therefore to be added to the apparent altitude, to obtain the true altitude. Hence also an object will appear to rise later and set sooner.

The sine of the parallax of an object is inversely as its distance from the earth's centre.

Demonstration.—Let A be the place of an object, and H the place of the same object at another time, or that of another object at the same instant; join EH, then in the triangles AOE, HOE,

$$R : \text{sine OAE} :: \text{AE} : \text{OE}$$

$$\text{sine OHE} : R :: \text{OE} : \text{EH}.$$

$$\text{Hence sine OHE} : \text{sine OAE} :: \text{AE} : \text{EH}.$$

The parallax of an object makes it appear more distant from the meridian than it really is.

Demonstration.—The true and apparent places of an object are in the same vertical, the apparent place being lower than the true; and all verticals meet at the zenith: hence the apparent place of an object is more distant from the plane of the meridian than the true place.

The longitude, latitude, right ascension, and declination of an object are affected by parallax. The difference between the true and apparent longitudes is called the parallax in longitude; in like manner, the differences between the true and apparent latitudes, right ascensions, and declinations, are called the parallax in latitude, right ascension, and declination, respectively.—When the object is in the nonagesimal, the parallax in longitude is nothing, but that in latitude is greatest: and when the object is in the meridian, the parallax in right ascension vanishes, and that in declination is a maximum. The apparent longitude is greater than the true longitude, when the object is east of the nonagesimal, otherwise less; and when the object is in the eastern hemisphere, the apparent right ascension exceeds the true, but is less than the true right ascen-

sion when the object is in the western hemisphere. The apparent place of an object is more distant from the elevated poles of the ecliptic and equator than the true place: hence, when the latitude of the place and elevated pole of the ecliptic are of the same name, the apparent latitude is less than the true latitude, otherwise greater; and the apparent declination will be less or greater than the true declination, according as the latitude of the place and declination of the object are of the same or of a contrary denomination.

The parallaxes in longitude, latitude, right ascension, and declination, in the spheroidal hypothesis, may be found by the following formulæ; in which L represents the latitude of the place, diminished by the angle contained between the vertical and radius of the given place; P the horizontal parallax for that place: a the altitude of the nonagesimal at the given instant; d the apparent distance of the object from the nonagesimal; λ the true and apparent latitudes of the objects; $D\delta$ the true and apparent declinations respectively; and m its apparent distance from the meridian.

Then par. in long. = $P \cdot \text{sine } a \cdot \text{sine } d \cdot \text{secant } l$, to radius unity; and par. in lat. = $P \cdot \text{cosine } a \cdot \text{cosine } \lambda \pm P \cdot \text{cosine } d \cdot \text{sine } a \cdot \text{sine } \lambda$.

The sign — is used when the apparent distance of the object from the nonagesimal and from the elevated pole of the ecliptic is of the same affection, and the sign + if of different affection. If the greatest precision be required, the following quantity $0.00000121216 \cdot \text{par. lon.}^2 \cdot \text{sine } 2l$, is to be applied to the parallax in latitude found as above, by addition or subtraction, according as the true distance of the object from the elevated pole of the ecliptic is greater or less than 90° .

Again, par. in right ascen. = $P \cdot \text{cosine } L \cdot \text{sine } m \cdot \text{secant } D$, to radius unity; and par. in declination = $P \cdot \text{sine } L \cdot \text{cosine } \delta \pm P \cdot \text{cosine } L \cdot \text{sine } \delta \cdot \text{cosine } m$.

The upper or lower sign is to be used according as the distance of the object from the meridian and from the elevated pole of the equator is of the same or different affection. Part 2d of par. in declination = $0.00000121216 \cdot \text{par. in right ascen.}^2 \cdot \text{sine } 2D$; which is additive to, or subtractive from, part first of parallax in declination, according as the true distance of the object from the elevated pole of the equator is greater or less than 90° .

The parallax always diminishes the altitude of a phenomenon, or makes it appear lower than it would do if viewed from the centre of the earth; and this change of the altitude may, according to the different situation of the ecliptic and equator in respect of the horizon of the spectator, cause a change of the latitude, longitude, declination, and right ascension of any phenomenon, which is called their parallax. The parallax, therefore, increases the right and oblique ascension; diminishes the descension; diminishes the northern declination and latitude in the eastern part, and increases them in the western; but increases the southern both in the eastern and western part; diminishes the longitude in the western part, and increases it in the eastern. Hence it appears, that the parallax has just opposite effects to refraction.

PARALLAX (Annual), the change of the apparent place of a heavenly body, which is caused by being viewed from the earth in different parts of its orbit round the sun. The annual parallax of all the planets is found very considerable, but that of the fixed stars is imperceptible.

To observe the Moon's Parallax.—Observe very accurately the moon's meridian altitude, and note

PARALLAX.

the moment of time. To this time, equated, compute her true latitude and longitude, and from these find her declination; also from her declination, and the elevation of the equator, find her true meridian altitude. Subtract the refraction from the observed altitude: then the difference between the remainder and the true altitude will be the parallax sought. If the observed altitude be not meridional, reduce it to the true altitude for the time of observation.

By this means, in 1583, Oct. 12 day 5h. 19 m. from the moon's meridian altitude observed at $13^{\circ} 38'$, Tycho found her parallax to be 54 minutes.

To observe the Moon's Parallax in an Eclipse.—In an eclipse of the moon observe when both horns are in the same vertical circle, and at that moment take the altitudes of both horns; then half their sum will be nearly the apparent altitude of the moon's centre; from which subtract the refraction, which gives the apparent altitude freed from refraction. But the true altitude is nearly equal to the altitude of the centre of the shadow at that time; now the altitude of the centre of the shadow is known, because we know the sun's place in the ecliptic, and his depression below the horizon, which is equal to the altitude of the opposite point of the ecliptic, in which the centre of the shadow is. Having thus the true and apparent altitudes, their difference is the parallax sought.

De la Hire makes the greatest horizontal parallax $1^{\circ} 1' 25''$, and the least $54' 5''$. M. le Monnier determined the mean parallax of the moon to be $57' 12''$. Others have made it $57' 18''$.

In the Philosophical Transactions for 1764, there is given a very ingenious method by Dr. Murdoch for finding the moon's parallax and distance, from the received principles of gravitation. He thence finds the mean horizontal parallax at the equator $57' 12'' 34$, supposing the earth immovable; and $56' 44'' 07$, supposing the earth and moon to revolve about their common centre of gravity.

To observe the Parallax of Mars.—1. Suppose Mars in the meridian and equator at H; and that the observer, under the equator in A, observes him culminating with some fixed star. 2. If now the observer were in the centre of the earth, he would see Mars constantly in the same point of the heavens with the star; and therefore, together with it, in the plane of the horizon, or of the 6th hour; but since Mars here has some sensible parallax, and the fixed star has none, Mars will be seen in the horizon, when in P, the plane of the sensible horizon; and the star, when in R, the plane of the true horizon: therefore observe the time between the transit of Mars and of the star through the plane of the 6th hour.—3. Convert this time into minutes of the equator, at the rate of 15 degrees to the hour; by which means there will be obtained the arch PM, to which the angle PAM, and consequently the angle AMD, is nearly equal; which is the horizontal parallax of Mars. (Pl. 129, fig. 3).

If the observer be not under the equator, but in a parallel IQ, that difference will be a less arch QM: wherefore, since the small arches QM and PM are nearly as their sines AD and ID; and since ADG is equal to the distance of the place from the equator, i. e. to the elevation of the pole, or the latitude; therefore AD to ID, as radius to the cosine of the latitude; say, as the cosine of the latitude ID is to radius, so is the parallax observed in I, to the parallax under the equator.

Since Mars and the fixed star cannot be com-

modiously observed in the horizon; let them be observed in the circle of the 3d hour: and since the parallax observed there TO, is to the horizontal one PM, as IS to ID: say, as the sine of the angle IDS, or 45° (since the plane DO is in the middle between the meridian DH and the true horizon DM), is to radius, so is the parallax TO to the horizontal parallax PM.

If Mars be likewise out of the plane of the equator, the parallax found will be an arch of a parallel; which must therefore be reduced, as above, to an arch of the equator.

Lastly, if Mars be not stationary, but either direct or retrograde, by observations for several days find out what his motion is every hour; that his true place from the centre may be assigned for any given time.

By this method Cassini, who was the author of it, observed the greatest horizontal parallax of Mars to be $25''$; but Mr. Flamsteed found it near $36''$. Cassini observed also the parallax of Venus by the same method.

To find the Sun's Parallax.—The great distance of the sun renders his parallax too small to fall under even the nicest immediate observation. Many attempts have indeed been made; both by the ancients and moderns, and many methods invented for that purpose. The first was that of Hipparchus, which was followed by Ptolemy, &c. and was founded on the observation of lunar eclipses. The second was that of Aristarchus, in which the angle subtended by the semi-diameter of the moon's orbit, seen from the sun, was sought from the lunar phases. But these both proving deficient, astronomers are now forced to have recourse to the parallaxes of the nearer planets, Mars and Venus. Now from the theory of the motions of the earth and planets, there is known at any time the proportion of the distances of the sun and planets from us; and the horizontal parallaxes being reciprocally proportional to those distances; by knowing the parallax of a planet, that of the sun may be thence found.

Thus Mars, when opposite to the sun, is twice as near as the sun is, and therefore his parallax will be twice as great as that of the sun. And Venus, when in her inferior conjunction with the sun, is sometimes nearer us than he is; and therefore her parallax is greater in the same proportion. Thus, from the parallaxes of Mars and Venus, Cassini found the sun's parallax to be $10''$; from whence his distance comes out 22000 semi-diameters of the earth.

But the most accurate method of determining the parallaxes of these planets, and thence the parallax of the sun, is that of observing their transit. However, Mercury, though frequently to be seen on the sun, is not fit for this purpose; because he is so near the sun, that the difference of their parallaxes is always less than the solar parallax required. But the parallax of Venus, being almost four times as great as the solar parallax, will cause very sensible differences between the times in which she will seem to be passing over the sun at different parts of the earth. With the view of engaging the attention of astronomers to this method of determining the sun's parallax, Dr. Halley communicated to the Royal Society, in 1691, a paper containing an account of the several years in which such a transit may happen, computed from the tables which were then in use: those at the ascending node occur in the month of November O. S. in the years 918, 1161, 1396, 1631, 1639, 1874, 2109, 2117; and

at the descending node in May O. S. in the years 1048, 1283, 1291, 1518, 1526, 1761, 1769, 1996, 2004.

Mr. Short with great labour deduced the quantity of the sun's parallax from the best observations that were made of the transit of Venus, on the 6th of June, 1761 (for which see Phil. Trans. vol. 51 and 52), both in Britain and in foreign parts, and found it to have been $8''.52$ on the day of the transit, when the sun was very nearly at his greatest distance from the earth; and, consequently, $8''.65$ when the sun is at his mean distance from the earth. See Philos. Trans. vol. 52, p. 611, &c. Whence,

As $\sin. 8''.65$	log. 5.6219140
to radius	10.0000000
So is 1 semidiameter	0.0000000
to 23882.84 semidiameters	4.3780660

that is, 23882 $\frac{84}{100}$ is the number of the earth's semidiameters contained in its distance from the sun; and this number of semidiameters being multiplied by 3985, the number of English miles contained in the earth's semidiameter (though later observations make this semidiameter only 3955 $\frac{1}{2}$ miles), there is obtained 95,173,127 miles for the earth's mean distance from the sun. And hence, from the analogies under the article DISTANCE, the mean distances of all the rest of the planets from the sun, in miles, are found as follow, viz.

Mercury's distance	36,841,468
Venus's distance	68,891,486
Mars's distance	145,014,148
Jupiter's distance	494,990,976
Saturn's distance	907,956,130

In another paper (Philos. Trans. vol. 53, p. 169) Mr. Short states the mean horizontal parallax of the sun at $8''.69$. And Dr. Hornsby, from several observations of the transit of June 3d, 1769 (for which see the Philos. Trans. vol. 59) deduces the sun's parallax for that day equal to $8''.65$, and the mean parallax $8''.78$; whence he makes the mean distance of the earth from the sun to be 93,726,900 English miles, and the distances of the other planets thus:

Mercury's distance - - -	36,281,700
Venus's distance - - -	67,795,500
Mars's distance - - -	142,818,000
Jupiter's distance - - -	487,472,000
Saturn's distance - - -	804,162,000

See the Philos. Trans. vol. 61, p. 572.

But others, by taking the results of those observations that are most to be depended on, have made the sun's parallax at his mean distance from the earth to be $8''.6045$; and some make it only 8.54 . According to the former of these, the sun's mean distance from the earth is 95,109,736 miles; and according to the latter it is 95,834,742 miles. For a detailed account of the methods employed on this occasion, see the treatises on astronomy by Ferguson, O. Gregory, and Vince.

Laplace has explained a method in his Mécanique Céleste of determining the sun's parallax by means of a lunar inequality, which depends upon the distance of the earth and sun. His result is $26''.4205$ of the new French division, or $8''.50024$ of the sexagesimal scale: and this gives 24096 radii of the earth for the sun's mean distance. See Méc. Céleste, tom. iii. p. 281, 282.

PARALLEL. α. (παράλληλος.) 1. Extended in the same direction, and preserving always

the same distance (*Brown*). 2. Having the same tendency (*Addison*). 3. Continuing the resemblance through many particulars; equal (*Watts*).

PARALLEL, in geometry, an appellation given to lines, surfaces, and bodies, every where equidistant from each other. See GEOMETRY.

PARALLEL SPHERE, that situation of the sphere wherein the equator coincides with the horizon, and the poles with the zenith and nadir.

PARALLEL SAILING. See NAVIGATION.

PARALLELS OF LATITUDE, in astronomy, are lesser circles of the sphere parallel to the ecliptic, imagined to pass through every degree and minute of the colures.

PARALLELS OF ALTITUDE, or **ALMUCANTARS**, are circles parallel to the horizon, imagined to pass through every degree and minute of the meridian between the horizon and zenith, having their poles in the zenith.

PARALLELS OF DECLINATION, in astronomy, are the same with parallels of latitude in geography.

PARALLEL. s. (from the adjective.) 1. Line continuing its course, and still remaining at the same distance from another line (*Pope*). 2. Line on the globe marking the latitude. 3. Direction conformable to that of another line (*Garth*). 4. Resemblance; likeness; conformity continued through many particulars (*Denham*). 5. Comparison made (*Addison*). 6. Any thing resembling another (*South*).

To PARALLEL. v. a. (from the noun.) 1. To place so as always to keep the same direction with another line (*Brown*). 2. To keep in the same direction; to level. 3. To correspond to (*Burnet*). 4. To be equal to; to resemble through many particulars (*Dryden*). 5. To compare (*Locke*).

PARALLEL RULER, an instrument consisting of two wooden, brass, &c. rulers equally broad every where; and so joined together by the cross blades, pl. 129, fig. 4. as to open to different intervals, accede and recede, and yet still retain their parallelism.

The use of this instrument is obvious; for one of the rulers being applied to RS, and the other withdrawn to a given point V, a right angle AB, drawn by its edge, through V, is a parallel to RS.

PARALLELISM, the quality of a parallel, or that which denominates it such. Or it is that by which two things, as lines, rays, or the like, become equidistant from one another.

PARALLELISM OF THE EARTH'S AXIS, is that invariable situation of the axis, in the progress of the earth through the annual orbit, by which it always keeps parallel to itself; so that if a line be drawn parallel to its axis, while in any one position; the axis, in all other positions or parts of the orbit, will always be parallel to the same line.

In consequence of this parallelism, the axis of the earth points always, as to sense, to the

same place or point in the heavens, viz. to the poles. Because, though really the axis, in the annual motion, describes the surface of a cylinder, whose base is the circle of the earth's annual orbit, yet this whole circle is but as a point in comparison with the distance of the fixed stars; and therefore all the sides of the cylinder seem to tend to the same point, which is the celestial pole. To this parallelism is owing the change and variety of seasons, with the inequality of days and nights.

This parallelism is the necessary consequence of the earth's double motion; the one round the sun, the other round its own axis. Nor is there any necessity to imagine a third motion, as some have done, to account for this parallelism.

PARALLELISM OF ROWS OF TREES. The eye placed at the end of an alley bounded by two rows of trees, planted in parallel lines, never sees them parallel, but always inclining to each other, towards the farther end.

Hence mathematicians have taken occasion to enquire, in what lines the trees must be disposed, to correct this effect of the perspective, and make the rows still appear parallel. And, to produce this effect, it is evident that the unequal intervals of any two opposite or corresponding trees may be seen under equal visual angles.

For this purpose, M. Fabry, Tacquet, and Varignon observe, that the rows must be opposite semi-hyperbolas. See the Mem. Acad. Sciences, an. 1715.

But notwithstanding the ingenuity of their speculations, it has been proved by D'Alembert and Bouguer, that to produce the effect proposed, the trees are to be ranged merely in two diverging right lines.

PARALLELOGRAM, in geometry, is a quadrilateral right-lined figure, whose opposite sides are parallel to each other.

A parallelogram may be conceived as generated by the motion of a right line, along a plane, always parallel to itself.

Parallelograms have several particular denominations, and are of several species, according to certain particular circumstances, as follows:

When the angles of the parallelogram are right ones it is called a rectangle.—When the angles are right, and all its sides equal, it is a square.—When the sides are equal, but the angles oblique ones, the figure is a rhombus or lozenge. And when both the sides and angles are unequal, it is a rhomboides.

PARALLELOGRAM OF THE HYPERBOLA, is the parallelogram formed by the two asymptotes of an hyperbola, and the parallels to them, drawn from any point of the curve. This term was first used by Huygens, at the end of his *Dissertatio de Causa Gravitatis*. This parallelogram, so formed, is of an invariable magnitude in the same hyperbola; and the rectangle of its sides is equal to the power of the hyperbola.

This parallelogram is also the modulus of

the logarithmic system; and if it be taken as unity or 1, the hyperbolic sectors and segments will correspond to Napier's or the natural logarithms; for which reason these have been called the hyperbolic logarithms. If the parallelogram be taken = $.43429448190$, &c. these sectors and segments will represent Briggs's logarithms; in which case the two asymptotes of the hyperbola make between them an angle of $25^{\circ} 44' 25'' \frac{1}{2}$.

PARALLELOGRAM OF FORCES, a term used to designate the parallelogram employed in the fundamental proposition of statics: viz. any two forces having the ratio and the direction of the sides of a parallelogram, have their equivalent or resulting force measured by the diagonal of that parallelogram, and in the direction of it. See **STATICS**.

PARALLELOGRAMICAL. *a.* (from *parallelogram*.) Having the properties of a parallelogram.

PARALLELOPIPED. *s.* (*parallelopede*, Fr.) A solid figure contained under six parallelograms, the opposite of which are equal and parallel; or it is a prism, whose base is a parallelogram: it is always triple to a pyramid of the same base and height (*Newton*).

PARALOGISM. *s.* (*παράλογισμος*.) A false argument (*Arbutnot*).

PARALOGY. *s.* False reasoning (*Brown*).

PARALYSIS. (*paralysis*, *παράλυσις*; from *παράλω*, to loose). The palsy. A genus of disease in the class neuroses, and order comata, of Cullen, known by a loss of the power of voluntary motion, affecting certain parts: species, 1. Paralysis partialis, partial, or palsy of some particular muscles. 2. Paralysis hemiplegica, palsy of one side. 3. Paralysis paraplegica, palsy of one half of the body. Paralysis venenata, from the sedative effects of poisons. Paralysis is also symptomatic of several diseases, as worms, scrophula, syphilis, &c.

PARALYSISHERBA. (*paralysis*, *παράλυσις*; from *παράλω*, to weaken; so called from its use in paralytic disorders). The cowslip and primrose are sometimes so termed. See **PRIMULA VERIS**, and **PRIMULA VULGARIS**.

PARALYTICAL. **PARALYTIC**. *a.* (from *paralysis*; *paralytique*, Fr.) Palsied; inclined to palsy (*Prior*).

PARAMARIBO, the capital of Surinam, in Guiana, and the chief place of the Dutch colonies in South America. It has a small but strong citadel; and a noble road for shipping, where there are seldom less than 80 vessels loading coffee, sugar, cotton, and indigo. The streets are straight, and lined with orange, shaddock, tamarind, and lemon trees, in continual bloom. It surrendered to the English in 1799, and in 1803. It is situate on the E. side of the river Surinam, 16 miles from its mouth. Lon. 55. 25 W. Lat. 5. 48 N.

PARAMECIUM, in zoology, a genus of the class vermes, order infusoria. Worm invisible to the naked eye, simple, pellucid, flattened, oblong. Seven species, found chiefly in

fresh stagnant water, or infusions, one in salt water. The following are principally entitled to notice.

1. *P. aurelia*. Compressed, longitudinally plaited towards the fore part, acute behind. Found in ditch waters and infusions; membranaceous; four times as long as it is broad, the fore part obtuse, hyaline, the hind part filled with molecules; the fold reaching from the middle to the tip.

2. *P. chrysalis*. Cylindrical, longitudinally plaited on the fore part, and obtuse behind. Found in salt water, resembles the last, but is more obtuse behind; the margins filled with black globules.

3. *P. acutum*. Tail two-edged, head acute. Found in stagnant water, in which duck-weed abounds; slow of motion, continually agitating the tail.

PARAMESE. (Greek.) The name applied by the ancients to the second sound of the second octave, because next in degree to the middle sound of their great system, or diagram. The paramese corresponded with our *B* above the fifth line in the bass.

PARAMETER, in conic sections, a constant line, otherwise called *latus rectum*. The parameter is said to be constant, because in the parabola, the rectangle under it and any absciss, is always equal to the square of the corresponding semi-ordinate; and in the ellipsis and hyperbola, it is a third proportional to the conjugate and transverse axis.

If *t* and *c* be the two axes in the ellipse and hyperbola, and *x* and *y* an absciss and its ordinate in the parabola: then

$t : c :: c : p = \frac{c^2}{t}$ = the parameter in the former;

$x : y :: y : p = \frac{y^2}{x}$ = the parameter in the last.

The parameter is equal to the double ordinate drawn through the focus of one of the three conic sections.

PARAMO (Louis de) a Spanish inquisitor, published at Madrid, 1598, in folio, a rare and curious work upon the tribunal, called The Holy Office. The author wrote with great candour, is exact in his dates, omitting no interesting fact, and enumerating without scruple all the victims who had suffered under the abominable inquisition.

PARAMOUNT. *a.* (*per* and *mount*.) 1. Superiour; having the highest jurisdiction: as, lord paramount, the chief of the seigniorie (*Glanville*). 2. Eminent; of the highest order (*Bacon*).

PARAMOUNT. *s.* The chief (*Milton*).

PARAMOUR. *s.* (*par* and *amour*, Fr.) 1. A lover or wooer (*Spenser*). 2. A mistress (*Shakspeare*).

PARANETE DIEZEUGMENON. (Gr.) The name by which the ancients distinguished the third string of the fourth tetrachord, the tone of which was equivalent to our *p* under the first line in the treble cliff.

PARANETE HYPERBOLÆON. (Greek.) The name given by the ancients to the penultima of the supreme, or fifth tetrachord. This sound corresponded with our treble-cliff note on the second line.

PARANETE SYNEMMENON. (Greek.) The appellation given by the ancients to the penultima, or last sound but one, of the third tetrachord. This sound corresponded with our *c* on the first ledger line in the base.

PARANYMPH. *s.* (*παρά and νύμφη*.) 1. A bride-man; one who leads the bride to her marriage (*Milton*). 2. One who countenances or supports another (*Taylor*).

PARAPEGM. *s.* (*παράπηγμ.*) A brazen table fixed to a pillar, on which laws and proclamations were anciently engraved; also a table, containing an account of the rising and setting of the stars, eclipses of the sun and moon, the seasons of the year, &c. (*Philips*).

PARAPET, in fortification, an elevation of earth designed for covering the soldiers from the enemies' cannon or small shot. The thickness of the parapet is from eighteen to twenty feet; its height is six feet on the inside, and four or five on the outside. It is raised on the rampart, and has a slope above called the superior talus, and sometimes the glacis of the parapet. The exterior talus of the parapet is the slope facing the country; there is a banquette or two for the soldiers who defend the parapet, to mount upon, that they may the better discover the country, fosse, and counterscarpe, and fire as they find occasion. Parapet of the covert-way, or corridor, is what covers that way from the sight of the enemy, which renders it the most dangerous place for the besiegers, because of the neighbourhood of the faces, flanks, and curtains of the place.

PARAPET is also a little wall raised breast high, on the banks of bridges, keys, or high buildings, to serve as a stay, and prevent people's falling over.

PARAPH, a particular character, knot, or flourish, which people habituate themselves to make always in the same manner at the end of their name, to prevent their signature from being counterfeited.

The paraph of the kings of France was a grate, which the secretaries always placed before their own, in all letters, &c. Menage derives the word from *paragraphe*.

PARAPHERNALIA, or **PARAPHERNA**, in the civil law, those goods which a wife brought her husband, besides her dower, and which were still to remain at her disposal, exclusive of her husband, unless there was some provision made to the contrary in the marriage-contract.

The word is formed from the Greek *παρά*, beyond, or over, and *περί*, dos, dower. In *his rebus quas extru dotem mulier habet, et quas Greci παραπερνα vocant, nullam, uxore prohibente, vir habeat communionem*.

PARAPHIMOSIS. (*paraphimosis*, *παρεφίμωσις*; from *παρά*, about, and *φίμωσις*, to bend.) In surgery, a disorder in which the prepuce being retracted toward the root of the penis,

cannot be returned over the glans, but makes a sort of ligature behind the corona. This disease is easily known; the glans is uncovered, the skin tumefied on the corona, and above it forms a circular collar or stricture, which, from the skin being unequally extended, becomes indented, and makes several rings round the part. This disease may proceed from two causes; as first from the imprudence of young people, and sometimes also of grown persons, who having the end of their prepuce too straight, cannot uncover their glans without pain, and when they have done it, neglect to return it so soon as they ought; whence the contracted part of the prepuce forms a constriction behind the glans. Soon after, the glans and penis swell, and the prepuce being consequently very much distended, is affected in the same manner; an inflammation seizes upon both, and swellings quickly appear upon the stricture formed by the prepuce, so that the whole may be liable to a gangrene, if not speedily relieved. The second thing that may produce a paraphymosis is a venereal virus. In adults, whose glans is uncovered, there frequently arise venereal chancres in the prepuce after impure coition, which before they digest, are generally attended with inflammation, more or less considerable. This inflammation is alone sufficient to render the prepuce too strait for the size of the penis, in consequence of which a swelling or inoculation may ensue like that before mentioned; and this is what is termed a paraphymosis, or paraphimosis.

PARAPHONIA. (*paraphonia*, παραφωνία; from παρα, wrong, and φωνη, sound). Alteration of the voice. A genus of disease in the class locales, and order dyscinesia of Cullen, comprehending six species, viz. paraphonia puberum, paraphonia rauca, paraphonia resonans, paraphonia palatina, paraphonia clangens, and paraphonia comatosa.

PARAPHRASE, an explanation of some text, in clearer and more ample terms, whereby is supplied what the author might have said or thought on the subject; such are esteemed Erasmus's Paraphrase on the New Testament, the Chaldee Paraphrase on the Pentateuch, &c.

To PARAPHRASE. *v. a.* (παράφραζω; paraphraser, Fr.) To interpret with laxity of expression; to translate loosely (*Stillingfleet*).

PARAPHRAST. *s.* (παράφραστης; paraphraste, Fr.) A lax interpreter; one who explains in many words (*Hooker*).

PARAPHRASTICAL. **PARAPHRASTIC.** *a.* (from *paraphrase*.) Lax in interpretation; not literal; not verbal.

PARAPHRENITIS. (*paraphrenitis*, παραφρενίτις; from παρα, dim. and φρενι, the mind). Diaphragmitis. An inflammation of the diaphragm. A genus of disease in the class pyrexiae and order phlegmasiae of Cullen, known by delirium, with difficulty of breathing, and pain in the region of the diaphragm.

PARAPLEGIA. (*paraplegia*, παραπληγία; from παραπλησσω, to strike inharmoniously.)

Palsy of one half of the body taken transversely. A species of paralysis. See **PARALYSIS**.

PARASANG, an ancient Persian measure, different at different times, and in different places; being usually 30, sometimes 40, and sometimes 50 stadia or furlongs. The word, according to Littleton, has its rise from *parasch angarius*, *q. d.* the space a postman rides from one station, *angarius*, to another.

PARASCENIUM, in the Grecian and Roman theatres, was a place behind the scenes whither the actors withdrew to dress and undress themselves. The Romans more frequently called it *Postscenium*. See **THEATRE**.

PARASELENE, in natural philosophy, a mock moon; a meteor or phenomenon encompassing or adjacent to the moon, in form of a luminous ring; wherein are observed sometimes one and sometimes two or more images of the moon.

PARASEMON, among the Greeks, was the figure carved on the prow of the ships to distinguish them from each other.

PARASITE. *s.* (*parasite*, Fr. *parasita*, Lat.) One that frequents rich tables, and earns his welcome by flattery (*Bacon*).

PARASITICAL. **PARASITIC.** *a.* (from *parasite*.) Flattering; wheedling (*Hak.*).

PARASITIC. In zoology. Animals, &c. are so termed, that receive their nourishment in the bodies of others, as worms, polypes, hydatids, &c.

PARASITIC STEM, in botany. *Parasitica planta*, or plant. *Alteri plantæ nec terræ innatus*. Growing on some other plant, not on the ground.—As *epidendrum*, *tillandsia*.

PARASOL. *s.* A small canopy or umbrella carried over the head, to shelter from the heat of the sun.

PARASTATA, in ancient architecture, a kind of pier, or piedroit, serving as a defence or support to a column or arch.

Mr. Evelyn makes the *parastata* the same with *pilaster*. *Barbaro*, and others, the same with *anta*; and *Daviler*, the same with *piedroit*. See **PILASTER**.

PARASTATÆ, in anatomy. See **PROSTATE**.

PARATHENAR. (παράθηναρ; from παρα, near, and θέναι, the sole of the foot). A muscle situated near the sole of the foot.

PARATHENAR MINOR. See **FLEXOR BREVIS MINIMI DIGITI PEDIS**.

PARATILMUS, in the ancient Greek jurisprudence, a name given to a sort of punishment imposed on adulterers who were poor, and unable to stand the common penalty.

It consisted either in making them run a horse-radish up the anus, which they called *απορραπανιδωσις*; or in tearing up by the roots the hair about the pudenda, which they called *παροστιλμωσις*, of *παροστιλμην*, to tear, pluck up.

PARAZONIUM, παραζώνιον, or *Scipio*, among medalists, a sceptre, rounded at the two ends in manner of a truncheon, or commander's staff; or a kind of poniard, or short sword, represented as worn at the girdle, on several ancient medals.

Antiquaries are much divided on the explanation of the parazonium; as, indeed, the form and manner of bearing it are very different. It is sometimes thrown across the shoulders in manner of a quiver.

To PARBOIL. *v. a.* (*parbouiller*, French.) To half boil; to boil in part (*Bacon*).

To PARBREAK. *v. n.* (*brecker*, Dutch.) To vomit; obsolete.

PARBREAK. *s.* (from the verb.) Vomit (*Spenser*).

PARBUNCLE, in a ship, the name of a rope almost like a pair of slings; it is seized both ends together, and then put almost double about any heavy thing that is to be hoisted in or out of the ship; having the hook of the runner hitched into it, to hoist it up by.

PARCÆ, in mythology, powerful goddesses who presided over the birth and the life of mankind. They were three in number, Clotho, Lachesis, and Atropos, daughters of Nox and Erebus, according to Hesiod, or of Jupiter and Themis, according to the same poet in another poem. Some make them daughters of the sea. Clotho, the youngest of the sisters, presided over the moment in which we are born, and held a distaff in her hand. Lachesis spun out all the events and actions of our life, and Atropos, the eldest of the three, cut the thread of human life with a pair of scissors. The power of the Parcæ was great and extensive. Some suppose that they were subjected to none of the gods but Jupiter, whilst others support that even Jupiter himself was obedient to their commands. According to the more received opinions, they were the arbiters of the life and death of mankind, and whatever good or evil befalls us in the world immediately proceeds from the Fates or Parcæ. The worship of the Parcæ was well established in some cities in Greece, and though mankind knew they were inexorable, yet they were eager to raise to them temples and statues. They received the same worship as the Furies, and their votaries yearly sacrificed to them black sheep. The Parcæ were generally represented as three old women, with chaplets made of wool, and interwoven with the flowers of Narcissus. One of them held a distaff, another the spindle, and the third was armed with scissors, with which she cut the thread which her sisters had spun. Their dress is differently represented by some authors. Hyginus and others call them the secretaries of heaven, and the keepers of the archives of eternity.

PARCEL. *s.* (*parcelle*, Fr. *particula*, Lat.) 1. A small bundle. 2. A part of the whole; part taken separately (*Arbutnot*). 3. A quantity or mass (*Newton*). 4. A number of persons: in contempt (*Shakspeare*). 5. Any number or quantity: in contempt.

To PARCEL. *v. a.* (from the noun.) 1. To divide into portions (*South*). 2. To make up into a mass (*Shakspeare*).

PARCEL-MAKERS, two officers in the exchequer, who make parcels of the escheator's accounts, in which they charge them with

every thing they have levied for the king's use, within the time of their office, and deliver the same to one of the auditors of the court, to make their accounts therewith.

PARCENERS, in law, persons holding lands in copartnership, and who may be compelled to make division. It occurs where lands descend to the females, who all take equal shares of their deceased father's lands.

PARCENERY. *s.* (from *parsonier*, Fr.) A holding or occupying of land by joint tenants, called coparceners (*Cowel*).

To PARCH. *v. a.* To burn slightly and superficially; to scorch; to dry up (*Shakspeare*).

To PARCH. *v. n.* To be scorched (*Shakspeare*).

PARCHMENT, in commerce, the skins of sheep or goats, prepared after such a manner as to render it proper for writing upon, covering books, &c. The manufacture of parchment is begun by the skinner, and finished by the parchment-maker. The skin, having been stripped of its wool, and placed in the lime-pit, in the manner described under the article SHAMMY, the skinner stretches it on a kind of frame, and pares off the flesh, with an iron instrument; this done, it is moistened with a rag, and powdered chalk being spread over it, the skinner takes a large pumice-stone, flat at bottom, and rubs over the skin, and thus scowers off the flesh; he then goes over it again with the iron instrument, moistens it as before, and rubs it again with the pumice-stone without any chalk underneath: this smooths and softens the flesh-side very considerably. He then drains it again, by passing over it the iron instrument as before. The flesh-side being thus drained, by scraping off the moisture, he in the same manner passes the iron over the wool or hair side: then stretches it tight on a frame, and scrapes the flesh-side again: this finishes its draining; and the more it is drained, the whiter it becomes. The skinner now throws on more chalk, sweeping it over with a piece of lamb-skin that has the wool on, and this smooths it still further. It is now left to dry, and when dried, taken off the frame by cutting it all round. The skin, thus far prepared by the skinner, is taken out of his hands by the parchment-maker, who first, while it is dry, pares it on a summer, (which is a calf-skin stretched in a frame) with a sharper instrument than that used by the skinner, and working with the arm from the top to the bottom of the skin, takes away about one half of its thickness. The skin thus equally pared on the flesh-side, is again rendered smooth, by being rubbed with the pumice-stone, on a bench covered with a sack stuffed with flocks, which leaves the parchment in a condition fit for writing upon. The parings thus taken off the leather are used in making glue, size, &c. (See GLUE, &c.) What is called vellum is only parchment made of the skins of abortives, or, at least, sucking calves. This has a much finer grain, and is whiter and smoother than parchment.

but is prepared in the same manner, except its not being passed through the lime-pit.

PARCIEUX, (Anthony de,) a French mathematician. He acquired reputation by his publications, as well as by his lectures, and died universally regretted, 1768. His works are a treatise of trigonometry, 4to.—essays on the probability of the duration of human life, 4to. &c. His nephew, of the same name, was, in 1779, professor of experimental philosophy in the military college of Brienne, and afterwards at the Lyceum at Paris. He was author of Orozio, a tragedy, written when young, and an elementary book on geometrical and astronomical calculations, &c. He died at Paris, 1798.

PARDALIS, in mastiology. See **FE-LIS**.

PARDIES (Ignatius Gaston), an ingenious French mathematician and philosopher, was born at Pau, in the province of Gascony, in 1636; his father being a counsellor of the parliament of that city. At the age of 16 he entered into the order of Jesuits, and made so great a proficiency in his studies, that he taught polite literature, and composed many pieces in prose and verse with a distinguished delicacy of thought and style, before he was well arrived at the age of manhood. Propriety and elegance of language appear to have been his first pursuits; for which purpose he studied the belles lettres, and other learned productions. But afterwards he devoted himself to mathematical and philosophical studies, and read, with due attention, the most valuable authors, ancient and modern, in those sciences: so that in a short time he made himself master of the Peripatetic and Cartesian philosophy, and taught them both with great reputation. Notwithstanding he embraced Cartesianism, yet he affected to be rather an inventor in philosophy himself. In this spirit he sometimes advanced very bold opinions in natural philosophy, which met with opposers, who charged him with starting absurdities: but he was ingenious enough to give his notions a plausible turn, so as to clear them seemingly from contradictions. His reputation procured him a call to Paris, as professor of rhetoric in the college of Lewis the Great. He also taught the mathematics in that city, as he had before done in other places. He had from his youth a happy genius for that science, and made a great progress in it; and the glory which his writings acquired him raised the highest expectations from his future labours; but these were all blasted by his early death in 1673, at 37 years of age; falling a victim to his zeal, he having caught a contagious disorder by preaching to the prisoners in the Bicetre.

PARDIES wrote with great neatness and elegance. His principal works are as follow:

1. *Horologium Thaumaticum duplex*; 1662, in 4to.
2. *Dissertatio de Motu et Natura Cometa-rum*; 1665, 8vo.

3. *Discours du Mouvement Local*; 1670, 12mo.

4. *Elemens de Geometrie*; 1670, 12mo. This has been translated into several languages; in English by Dr. Harris in 1711.

5. *Discours de la Connoissance des Betes*; 1672, 12mo.

6. *Lettre d'un Philosophe à un Cartesien de ses amis*; 1672, 12mo.

7. *La Statique ou la Science des Forces Mouvantes*; 1673, 12mo.

8. *Description et Explication de deux Machines propres à faire des Cadrans avec une grande facilité*; 1673, 12mo.

9. *Remarques du Mouvement de la Lumiere*.

10. *Globi Cœlestis in tabula plana redacti Descriptio*; 1675, folio.

Part of his works were printed together, at the Hague, 1691, in 12mo; and again at Lyons, 1725.—Pardies had a dispute also with sir Isaac Newton, about his New Theory of Light and Colours, in 1672. His letters are inserted in the Philosophical Transactions for that year. (*Hutton's Dictionary*).

TO PARDON. *v. a.* (*pardonner*, French.)

1. To excuse an offender (*Dryden*). 2. To forgive a crime (*Dryden*). 3. To remit a penalty (*Shakspeare*). 4. *Pardon me*, is a phrase of civil denial, or slight apology (*Shakspeare*).

PARDON. *s.* (*pardon*, French.) 1. Forgiveness of an offender. 2. Forgiveness of a crime (*Milton*). 3. Remission of penalty. 4. Forgiveness received (*South*). 5. Warrant of forgiveness, or exemption from punishment (*Shakspeare*).

PARDON, is the remitting or forgiving a felony or other offence committed against the king. Blackstone mentions the power of pardoning offences to be one of the greatest advantages of monarchy, in general, above every other form of government, and which cannot subsist in democracies. Its utility and necessity are defended by him on all those principles which do honour to human nature.

Pardons are either general or special: general, as by act of parliament, of which, if they are without exceptions, the court must take notice, *ex officio*; but if there are exceptions therein, the party must aver, that he is none of the persons excepted: special pardons, are either of course, as to persons convicted of manslaughter, or *se defendendo*, and by several statutes, to those who shall discover their accomplices in several felonies; or of grace, which are by the king's charter, of which the court cannot take notice, *ex officio*, but they must be pleaded. A pardon may be conditional, that is, the king may extend his mercy upon what terms he pleases; and may annex to his bounty a condition, either precedent or subsequent, on the performance whereof the validity of the pardon will depend; and this by the common law.

All pardons must be under the great seal. The effect of a pardon is to make the offender a new man; to acquit him of all corporal pe-

nalties and forfeitures annexed to that offence, and to give him a new credit and capacity; but nothing but an act of parliament can restore or purify the blood after an attainer.

PARDONABLE. *a.* (*pardonable*, Fr.) Venial; excusable (*Dryden*).

PARDONABLENESS. *s.* (from *pardonable*.) Venialness; susceptibility of pardon.

PARDONABLY. *ad.* (from *pardonable*.) Venially; excusably (*Dryden*).

PARDONER. *s.* (from *pardon*.) 1. One who forgives another (*Shakspeare*). 2. A fellow that carried about the pope's indulgences, and sold them to such as would buy them (*Conell*).

PARDUBITZ, a town of Bohemia, in the circle of Chrudin, with a fortified castle. It has a manufacture of knives and sword-blades, and stands on the Elbe, 43 miles E. by S. of Prague. Lon. 15. 41 E. Lat. 49. 58 N.

To PARE. *v. a.* To cut off extremities of the surface; to cut away by little and little; to diminish (*Hooker*).

PARE (Ambrose), an eminent surgeon, born at Laval. Though a protestant, he was surgeon to Henry II. of France, and to his successors; and at the massacre of St. Bartholomew, Charles IX. saved his life by shutting him up in his own closet. He made some useful discoveries in anatomy, and died 1590, at an advanced age. His works were translated into Latin by Guillemeau.

PARE (David), a protestant divine, born 1548, in Silesia. His step-mother placed him with an apothecary, and afterwards with a shoemaker; but his father recovering to a sense of his duty, permitted him to cultivate literature. By the advice of his master he exchanged his name of Wangler for the Greek word Pareus, and he became theological professor at Heidelberg. The best part of his life was engaged in controversy, in which he displayed learning and moderation. He died 1622, in his pareanum, in the suburbs of Heidelberg. Besides some tracts against the pope, and Bellarmine, he published a commentary on St. Paul's epistle to the Romans, which was condemned by the university of Oxford, and burnt publicly by order of James I.

PARE (Philip), son to the above, was a grammarian, born at Hembach, 1576. He was rector of the college of Neustadt, and afterwards of Hanau, and died 1650. He wrote *Lexicon Criticum*, 8vo; *Lexicon Plautinum*, or a Vocabulary of Plautus' Comedies; *Galligraphia Romana*, 8vo. &c.

PAREGORICS. (*medicamento paregorica*, *παρεγορικὰ*; from *παρεγορεω*, to mitigate, to assuage.) Medicines that allay pain.

PARENCHYMA. (*παρεγχυμα*; from *παρεχω*, to strain through, because the ancients believed the blood was strained through it.) In anatomy, the spongy and cellular substance that connects parts together. It is now only, in anatomy, applied to the connecting medium of the substance of the lungs.

PARENCHYMA, in botany, the fleshy sub-

stance which lies within the cellular membrane, and surrounds the medulla or pith of plants, and is said to be the chief seat of vegetable irritability. See Willdenow, p. 241.

PARENT, a term of relation applied to those persons from whom we derive our temporal existence.

The moral duties of parents towards their offspring, being a subject too extensive for our plan, we shall not enter into any ethical inquiry, but confine our attention to their legal duties; that is, such as they owe to their legitimate children, respecting their maintenance, education, and protection.

1. With regard to their maintenance, it is a principle both of law and nature, that every man is bound to provide for his offspring. The father and mother, and also the grandsire and grandmother of feeble and poor descendants, are obliged by the 43 Eliz. c. 2, to support them at their own expence (provided they be able), in such manner as shall be directed by the quarter-sessions; and, if a man abscond, and desert his children, the 5 Geo. I. c. 8, directs the churchwardens and overseers of his parish to seize his property, and dispose of it for their relief. Thus, it has been wisely established by these statutes, that if a mother or grandmother, who formerly was able to maintain the child, marry a second time, the step-father becomes chargeable with its maintenance; for, being their debt when single, it extends in common with all others to charge, the second husband; but, as the death of the wife dissolves the relation, such duty then ceases to bind him. No person, however, is compellable to support his issue, excepting the latter be incapacitated from labour by infancy, disease, or accident; in which cases the former is obliged to provide them with necessaries, on penalty of paying 20s. per month to the parish, in case of refusal.

Farther, the law of England does not prevent a man from disinheriting his children by will; but, in conformity to the custom of London, the offspring of freemen are entitled to one-third part of their father's effects, which must be equally divided among them, and of which they cannot be deprived. Hence, too, heirs and children are peculiarly protected by courts of justice; lest they should be disinherited by any ambiguous or uncertain expressions; because it is necessary to prove, beyond the possibility of doubt, the testator's intention to deprive them of their right of inheritance.

2. The most important duty of parents is that of educating their children, in a manner becoming their rank in life. And, though it must be confessed that the law of England is deficient in this respect, yet it has also provided for the welfare of the rising generation; as, by the statutes for the apprenticing of poor children, these are to be taken from their parents, and placed by the churchwardens of the parish in such situations, as may render them most useful to the commonwealth.

3. The last duty of parents towards their offspring is protection, which may be considered principally as a natural obligation; no municipal laws enjoining its observance. But, though a child be thus placed in the power of its parent, the latter cannot abuse such authority. He may exercise proper severity to keep his children in due obedience: thus, he may lawfully, and in a reasonable manner, chastise them; because such correction is sometimes necessary, and conducive to their improvement. This authority of the parent, however, extends only to the end of the child's minority, during which period the former is entitled to the benefit of the labour and assistance thus obtained, while the latter resides with, and is maintained by him: a parent may likewise allow or forbid the marriage of his children, till they attain the age of twenty-one years. Now, the legal power of the progenitor ceases; because the adults are enfranchised by arriving at years of discretion, when the empire of the father, or of the guardian, is supposed to yield to that of reason.

PARENT (Anthony), a respectable French mathematician, was born at Paris in 1666. He showed an early propensity to the mathematics, eagerly perusing such books in that science as fell in his way. His custom was to write remarks in the margins of the books he read; and in this way he had filled a number of books with a kind of commentary by the time he was thirteen years of age.

Soon after this he was put under a master, who taught rhetoric at Chartres. Here he happened to see a dodecahedron, upon every face of which was delineated a sun-dial, except the lowest on which it stood. Struck as it were instantaneously with the curiosity of these dials, he attempted drawing one himself: but having only a book which taught the practical part, without the theory, it was not till after his master came to explain the doctrine of the sphere to him, that he began to understand how the projection of the circles of the sphere formed sun-dials. He then undertook to write a treatise upon gnomonics. To be sure the piece was rude and unpolished enough; however, it was entirely his own, and not borrowed. About the same time he wrote a book of geometry, in the same taste, at Beauvais.

His friends then sent for him to Paris to study the law; and in obedience to them he went through a course in that faculty: which was no sooner finished, than, urged by his passion for mathematics, he shut himself up in the college of Dormans, that no avocation might take him from his beloved study: and, with an allowance of less than 200 livres a year, he lived content in this retreat, from which he never stirred but to the Royal College, in order to hear the lectures of M. de la Hire or M. de Sauveur. When he found himself capable of teaching others, he took pupils: and fortification being a branch of mathematics which the war had brought into particular notice, he turned his attention to it;

but after some time began to entertain scruples about teaching what he had never seen, and knew only by the force of imagination. He imparted this scruple to M. Sauveur, who recommended him to the marquis d'Aligre, who luckily at that time wanted to have a mathematician with him. Parent made two campaigns with the marquis, by which he instructed himself sufficiently in viewing fortified places; of which he drew a number of plans, though he had never learned the art of drawing. From this period he spent his time in a continual application to the study of natural philosophy, and mathematics in all its branches, both speculative and practical; to which he joined anatomy, botany, and chemistry. His genius managed every thing, and yet he was incessant and indefatigable in his application. M. de Billetes, who was admitted in the academy of sciences at Paris, in 1699, with the title of their mechanician, nominated for his disciple Parent, who excelled chiefly in this branch. It was soon discovered in this society, that he engaged in all the various subjects which were brought before them; and indeed that he had a hand in every thing. But this extent of knowledge, joined to a natural impetuosity of temper, raised in him a spirit of contradiction, which he indulged on all occasions; sometimes to a degree of precipitancy highly culpable, and often with but little regard to decency. Indeed the same behaviour was shown to him, and the papers which he brought to the academy were often treated with much severity. He was charged with obscurity in his productions; and he was indeed so notorious for this fault, that he perceived it himself, and could not avoid correcting it. The king had, by a regulation in 1716, suppressed the class of scholars of the academy, which seemed to put too great an inequality betwixt the members. Parent was made a joint or assistant member for geometry: but he enjoyed this promotion but a short time; for he was taken off by the small-pox the same year, at the age of 50. He was author of a great many pieces, chiefly on mechanics and geometry.

PA'RENTAGE. *s.* (from *parent*.) Extraction; birth; condition with respect to the rank of parents (*Shakspeare*).

PARENTAL. *a.* (from *parent*.) Becoming parents; pertaining to parents (*Brown*).

PARENTA'TION. *s.* (from *parento*, Lat.) Something done or said in honour of the dead.

PARENTHESIS. *s.* (*parenthese*, French. *παρεσβ*, *εσ* and *παραρτησις*.) A sentence so included in another sentence, as that it may be taken out without injuring the sense of that which encloses it: commonly marked thus () (*Watts*).

PARENTHETICAL. *a.* (from *parenthese*.) Pertaining to a parenthesis.

PARENZA, a seaport of Istria, on a peninsula in the gulf of Venice, with a harbour for large vessels. It is 28 miles S. by W. of Capo d'Istria. Lon. 13. 50 E. Lat. 45. 18 N.

PARER. *s.* (from *pare*.) An instrument to cut away the surface (*Tusser*).

PARERGY. *s.* (*παρά and εργον*.) Something unimportant; something done by the by (*Brown*).

PAREISIS. (*παρεΐσις*; from *παύωμαι*, to relax.) An imperfect palsy.

PARGET. *s.* Plaster laid upon roofs of rooms (*Woodward*).

TO PARGET. *v. a.* (from the noun.) To plaster; to cover with plaster (*G. of Tongue*).

PARGETING, in building, is used for the plastering of walls, and sometimes for plaster itself. Pargeting is of various kinds: as, 1. White-lime and hair-mortar laid on bare walls. 2. On bare laths, as in partitioning and plain ceiling. 3. Rendering the insides of walls, or doubling partition walls. 4. Rough-casting on heart-laths. 5. Plastering on brick-work, with finishing mortar, in imitation of stone-work; and the like upon heart-laths.

PARHELION, or **PARHELUM**. (formed from *παρα*, near, and *ήλιος*, sun.) In natural philosophy, a mock-sun or meteor, in form of a very bright light appearing on one side of the sun. Appearances of this kind have been made mention of both by the ancients and moderns. Aristotle observes, that in general they are seen only when the sun is near the horizon, though he takes notice of two that were seen in Bosphorus from morning to evening; and Pliny has related the times when such phenomena were observed at Rome. Gassendi says, that in 1635 and 1636, he often saw one mock-sun. Two were observed by M. de la Hire in 1689; and the same number by Cassini in 1693, Mr. Grey in 1700, and Dr. Halley in 1702: but the most celebrated appearances of this kind were seen at Rome by Scheiner, by Muschenbroeck at Utrecht, and by Hevelius at Sedan. By the two former, four mock-suns were observed, and by the latter seven.

Parhelia are apparently of the same size with the sun, though not always of the same brightness, nor even of the same shape; and when a number appear at once, there is some difference in both these respects among them. Externally they are tinged with colours like the rainbow; and many have a long fiery tail opposite to the sun, but paler towards the extremity. Parhelia are generally accompanied with coronas, some of which are tinged with rainbow colours, but others are white. They differ in number and size; but all agree in breadth, which is that of the apparent diameter of the sun.

A very large white circle, parallel to the horizon, generally passes through all the parhelia; and, if it were entire, it would go through the centre of the sun. Sometimes there are arcs of lesser circles concentric to this, touching those coloured circles which surround the sun. They are also tinged with colours, and contain other parhelia. There are also said to have been other circles obliquely situated with respect to all those we have mentioned: but of this we have met with no authentic account.

The order of the colours in these circles is the same as in the rainbow; but on the inside, with respect to the sun, they are red, as is also observed in many other coronas.

Dr. Thomas Young has recently proposed a new theory of both halos and parhelia, as follows:

The explanation of the primary and secondary rainbow, begun by de Dominis, and completed by Descartes and Newton, derives an entire and satisfactory confirmation from the perfect coincidence of the observed angular magnitudes, with the result of calculations of the effect of spherical drops. We know that drops of water, either accurately, or very nearly spherical, exist in great abundance in every cloud, and in every shower of rain; and whatever their dimensions may be, they must necessarily conspire in the same general effect of producing the same rainbow, whenever a spectator is placed in a proper situation for observing it; consequently such rainbows are of very frequent occurrence.

Dr. Young has attempted to show, that for producing the phenomena of variable halos, often observable in hot climates, it is only necessary that a considerable part of the spherules of a cloud or mist be either accurately, or very nearly, of equal magnitude, a condition, of which the possibility is easily admitted from analogy, and the probability is favoured by the apparent uniformity of the different parts of such mists as we can examine.

But no satisfactory reason has hitherto been assigned for the production of the halo, which in these climates is the most common of all; that is, the constant halo of 23° or 24°. The hypothesis by which Huygens attempted to explain the production of halos and parhelia, are both arbitrary and improbable. He imagined the existence of particles of hail, some globular, others cylindrical, with an opaque part in the middle of each, bearing a certain ratio to the whole; and he supposed the position of the cylinders to be sometimes vertical, and sometimes inclined to the horizon in a given angle.

It has already been objected, that no such particles have ever been observed to accompany halos; and it is, besides, highly improbable, that such an opaque part should bear the same proportion in all the hailstones, and that the cylinders should have terminations so peculiar as is supposed; and the most incredible circumstance of all is, that all these proportions should be constantly such, as always to produce a halo at the distance of 23° or 24° from the sun or moon.

It appears that a much simpler and more natural explanation of these phenomena may be deduced from the regular crystallization of snow in the atmosphere.

It is well known, that the crystals of ice and snow tend always to form angles of 60°; now a prism of water or ice, of 60°, produces a deviation of 23° 37', for rays forming equal angles with its surfaces, and the angle of deviation varies at first very slowly, as the inclination

changes, the variation amounting to less than 3° , while the inclination changes 30° .

Now if such prisms were placed at all possible angles of inclination, differing equally from each other, one half of them would be so situated, as to be incapable of transmitting any light regularly by two successive refractions directed the same way; and of the remaining two-fourths, the one would refract all the light within these three degrees, and the other would disperse the light in a space of between 20° and 30° beyond them.

In the same manner we may imagine an immense number of prismatic particles of snow to be disposed in all possible directions, and a considerable proportion of them to be so situated, that the plane of their transverse section may pass within certain limits of the sun and the spectator. Then half of these only will appear illuminated, and the greater part of the light will be transmitted by such as are situated at an angular distance of $23^\circ 37'$, or within 3° of it: the limit being strongly marked internally, but the light being externally more gradually lost. And this is precisely the appearance of the most common halo. When there is a sufficient quantity of the prismatic particles, a considerable part of the light must fall, after one refraction, on a second particle; so that the effect will be doubled: and, in this case, the angle of refraction will become sufficient to present a faint appearance of colour, the red being internal, as the least refrangible light, and the external part having a tinge of blue.

These concentric halos of 231° and 47° are therefore sufficiently explicable, by particles of snow, situated promiscuously in all possible directions. If the prisms be so short as to form triangular plates, these plates, in falling through the air, will tend to assume a vertical direction, and a much greater number of them will be in this situation than in any other. The reflection from their flat surfaces will consequently produce a horizontal circle of equal height with the sun; and their refraction will exhibit a bright parhelion immediately over the sun, with an appearance of wings, or horns, diverging upwards from the parhelion.

For all such particles as are directed nearly towards the spectator, will conspire in transmitting the light much more copiously than it can arrive from any other part of the circle; but such as are turned more obliquely will produce a greater deviation in the light, and at the same time a deflection from the original vertical plane. This may be easily understood, by looking at a long line through a prism, held parallel to it: the line appears, instead of a right line, to become a curve, the deviation being greater in those rays that pass obliquely with respect to the axis of the prism; which are also deflected from the plane in which they were passing.

The line viewed through the prism has no point of contrary flexure, but if its ordinates

were referred to a centre, as in the case of the halos, it would assume a form similar to that which parhelia frequently assume.

The form of the flakes of snow as they usually fall is indeed more complicated than we have been supposing, but their elements in the upper regions of the air are probably more simple. The coincidence in the magnitude of the observed and calculated angles is so striking, as to be nearly decisive with respect to halos, and it is not difficult to imagine that many circumstances may exist, which may cause the axis of the greater number of the prisms to assume a position nearly horizontal, which is all that is required for the explanation of the parhelia with their curved appendages. Perhaps also, the effect may sometimes be facilitated by the partial melting of the snow into conoidal drops: for it may be shown, by the light of a candle transmitted through a wine glass full of water, that such a form is accommodated to the production of an inverted arch of light, like that which is frequently observed to accompany a parhelion.

PARIA, or **NEW ANDALUSIA**, a province of Terra Firma, in the government of Caraccas, lying to the S.E. of Cumana, on the banks of the Oronoko, and including the delta of the river. On the N. of this province, between Cumana and the island of Trinidad, is a large bay called the Gulf of Paria.

PARIAN CHRONICLE. See **ARUNDelian MARBLES**.

PARIANA. In botany, a genus of the class monœcia, order polyandria. Male: flowers in whorls, forming spikes; calyx two-valved; corol two-valved, larger than the calyx; stigmas two; seeds three-sided, inclosed. One species: a Cayenne plant.

PARIAS, or **PERREAS**, a tribe of Hindus, so peculiarly distinguished from all others, that they live by themselves in the out-skirts of towns; and, in the country build their houses apart from the villages, or rather have villages of their own, furnished with wells; for they dare not so much as fetch water from those which other families make use of; and, lest these latter should inadvertently go to one of theirs, they are obliged to scatter the bones of dead cattle about their wells, that they may be known. They dare not in cities pass through the streets where the Bramins live; nor set foot in the villages where they dwell. They are likewise forbidden to enter a temple, either of their god Wistnow or Eswara; because they are held impure. They get their bread by sowing, digging, and building the walls of mud-houses; most of those inhabited by the common people being raised by these Parias, who also do such kinds of dirty work as other people do not care to meddle with. Nor is their diet much more cleanly.

PARIERA BRAVA. (*pariera*, Span.) The root of this plant, *cissampelos pareira*, *foliis pellatis cordatis emarginatis* of Linnæus. C. O. Dioclea. Monadelphia. A native of South America and the West Indies, has no

remarkable smell, but to the taste it manifests a notable sweetness of the liquorice kind, together with a considerable bitterness, and a slight roughness covered by the sweet matter. The facts adduced on the utility of the radix *pareiræ* bravæ in nephritic and calculous complaints are principally mentioned by foreigners, and no remarkable instances of its efficacy are recorded by English practitioners.

PARIETAL BONES. (*parietalis*, from *paries*, a wall, because they defend the brain like walls.) *Ossa verticis*. *Ossa sincipitis*. *Ossa verticalia vel bregmatis*. Two arched and somewhat quadrangular bones, situated one on each side of the superior part of the cranium. Each of these bones forms an irregular square. They are thicker above than below; but are somewhat thinner, and at the same time more equal and smooth than the other bones of the cranium. The only foramen we observe in them is a small one towards the upper and posterior part of each. It has been named the parietal foramen, and serves for the transmission of a small vein to the longitudinal sinus. In many subjects this foramen is wanting. On the inner surface of these bones are the marks of the vessels of the dura mater, and of the convoluted surface of the brain. On the inside of their upper edge we may likewise observe a considerable furrow, which corresponds with the longitudinal sinus of the dura mater; and lower down, towards their posterior and inferior angle, is a smaller one for part of the lateral sinuses. These bones are joined to each other by the sagittal suture; to the *os sphenoides*, and *os temporum*, by the squamous suture; to the *os occipitis* by the lambdoidal suture; and to the *os frontis* by the coronal suture. Their connection with this latter bone is well worthy our attention. We shall find, that in the middle of the suture, where the *os frontis*, from its size and flatness, is the most in danger of being injured, it rests upon the arch formed by the parietal bones; whereas at the sides, the parietal bones are found resting upon the *os frontis*, because this same arch is there in the greatest danger from pressure. In new-born infants, the *ossa parietalia* are separated from the middle of the divided *os frontis* by a portion of the cranium, then unossified. When the finger is applied to this part, the motion of the brain, and the pulsation of the arteries of the dura mater, may be easily distinguished. In general, the whole of this part is completely ossified before we are seven years of age.

PARIETARIA. Pellitory. In botany, a genus of the class polygamia, order monoecia. Herm.: calyx four-cleft; stamens four; style one; seed one, superior, covered with the elongated calyx. Fem.: stamenless. Ten species; chiefly of the Cape, India, and south of Europe: one, *P. officinalis*, common to the walls of our own country.

The only cultivated species is *P. arboreum*, tree pellitory, a soft upright shrub of a man's height, with red shoots, villose with hoary

hairs; flowers commonly three, clustered, from the axil of each bracte, sessile; in the male yellow, in the female red, herbaceous. A native of the Canaries.

PARING. *s.* (from *pare*.) That which is pared off any thing; the rind (*Pope*).

PARING, in farriery, an operation performed on a horse's foot with a view to adapt it to the shoe. This is done with a butteris, and frequently to the great prejudice of the foot. The original design of shoeing horses was undoubtedly intended as a preservation of the hoof, and a defence of the sole; but no one could think it necessary to pare away what he wanted to preserve by the use of shoes, because that would be to act contrary to his first principles, and destroy his own work. This preparation should never be permitted, but in cases where the horny sole is uneven, insomuch that the shoe will not otherwise bear equally upon the foot, which would take off from its necessary firmness. In such a case, perhaps, it may be reasonable, otherwise it must be very absurd and injurious. The farrier usually holds the horse's foot between his knees, in which posture he pares the foot, sets on the shoe, drives the nails, and rivets them; and all this without any assistance.

PARING, in husbandry, a particular process for clearing the soil of weeds and rendering it more productive. See **HUSBANDRY**.

PARIS, the son of Priam, king of Troy, by Hecuba, also called Alexander, was destined, even before his birth, to become the ruin of his country. When his mother, in her pregnancy, had dreamed she should bring forth a torch, which would set fire to her palace, the soothsayers foretold her offspring would prove the destruction of Troy. Priam, to prevent so great an evil, ordered his slave Archelaus to destroy the child as soon as born. The slave, touched with humanity, did not destroy him, but exposed him on mount Ida, where the shepherds found him, and educated him as their own. Paris, though educated among shepherds, gave early proofs of courage, and from his care in protecting the flocks of mount Ida against the wild beasts, he obtained the name of Alexander (helper or defender). Here he gained the favour of Cœnone, a nymph of Ida, whom he married, but their conjugal peace was soon disturbed. At the marriage of Peleus and Thetis, the goddess of discord, not being invited to the entertainment, showed her displeasure, by throwing among the gods; at the celebration of the nuptials, a golden apple, on which were written the words *Detur pulchriori*. All the goddesses claimed it as their own, but Juno, Venus, and Minerva, only wished to dispute the right to the apple. The gods then appointed Paris to adjudge the prize of beauty to the fairest of the goddesses. The goddesses appeared before their judge without any ornament, and each tried by promises, &c. to influence his judgment. Juno promised him a kingdom; Minerva, military glory; and Venus, the fairest woman in the

P A R I S.

world for his wife. Paris at length adjudged the prize to Venus. This decision of Paris in favour of Venus drew upon the judge and his family the resentment of the two other goddesses. From some subsequent circumstances, the birth and the manner of preservation of Paris were discovered, and Priam finally acknowledged him as his son, forgetful of the alarming dreams which had influenced him to meditate his death. Paris then equipped a fleet, as if willing to redeem Hesione, whom Hercules had carried away and obliged to marry Telamon. This was the pretended motive of his voyage. He recollected that he was to have Helen, the fairest woman of the age, whom Venus had promised him. On these grounds he visited Sparta, the residence of Helen, who had married Menelaus, and was received kindly, but he abused the hospitality of Menelaus, and while he was absent in Crete, Paris carried off Helen, and Priam received her into his palace. This affair was soon productive of serious consequences. When Menelaus had married Helen, all her suitors had bound themselves by a solemn oath to defend her from every violence (see HELENA), and therefore her husband reminded them of their engagements. Upon this, all Greece took up arms. Agamemnon was chosen general of the combined forces, and a regular war was begun. (See TROJA.) Paris, meanwhile, armed himself with his brothers to oppose the enemy. He fought with little courage, and at the sight of Menelaus he retired from the front of the army. In a combat with Menelaus, he must have perished, had not Venus stolen him from the resentment of his adversary. He nevertheless wounded in another battle Machaon, Euripilus, and Diomedes, and according to some, killed the great Achilles. (See ACHILLES.) The death of Paris is differently related. Some say he died by one of the arrows of Philoctetes, which had been once in the possession of Hercules.

PARIS (Matthew), one of our best historians from William the Conqueror to the latter end of the reign of Henry III. but of his life few particulars have been transmitted to us. Leland, his original biographer, without determining whether he was born in France or England, informs us, that he was a monk of St. Alban's, and that he was sent by pope Innocent to reform the monks of the convent at Holm in Norway. Bishop Bale, the next in point of time, adds to the above relation, that, on account of his extraordinary gifts of body and mind, he was much esteemed, particularly by king Henry III. who commanded him to write the history of his reign. Fuller makes him a native of Cambridgeshire, because there was an ancient family of his name in that county. He also mentions his being sent by the pope to visit the monks in the diocese of Norwich. Bishop Tanner, bishop Nicholson, doctor du Pin, and the *Nouveau Dictionnaire Historique*, add not a single fact to those above related. Matthew Paris died in the monastery of St. Alban's in the year 1259. He was doubt-

less a man of extraordinary knowledge for the 13th century; of an excellent moral character, and, as an historian, of strict integrity. His style is unpolished; but that defect is sufficiently atoned for by the honest freedom with which he relates the truth, regardless of the dignity or sanctity of the persons concerned. His works are, 1. *Historia ab Adamo ad Conquestum Angliæ*, lib. i. manuscript. col. C. C. Cantab. c. ix. Most of this book is transcribed, by Matthew of Westminster, into the first part of his *Florilegium*. 2. *Historia major, seu rerum Anglicanorum historia a Gul. Conquestoris adventu ad annum 43 Henrici III.* &c. several times printed. The first part of this history, viz. to the year 1235, is transcribed almost verbatim from the Chronicle of Roger Wendover; and the Appendix, from the year 1260, is the work of William Rashington, who was also a monk of St. Alban's. 3. *Vitæ duorum Offarum, Mercie regum, S. Albani fundatorum*. 4. *Gesta 22. addatum S. Albani*. 5. *Addimenta chronicorum ad hist. majorem*; printed. 6. *Historia minor, sive epitome majoris historiæ*; manuscript. Besides many other things in manuscript.

PARIS, a city and the capital of France, the see of an archbishop, and the seat of a university. The river Seine, which crosses it, forms two small islands, called Isle du Palais and Isle Notre Dame; the first is the ancient city of Paris, and had its name from a building which was formerly the residence of the kings, and afterwards resigned to the parliament. Paris has 16 gates, and is 15 miles in circumference, including the suburbs. That part of it which is called the ville is situate to the north, the university to the south, and the city in the centre. The streets are narrow, and generally without accommodation for foot passengers. The houses are built of freestone, many of them seven stories high, and often contain a different family on every floor. The number of inhabitants, by a late official statement, is 546,856. There are nine principal bridges in Paris, but only three of them occupy the whole breadth of the Seine, which is not half so large as the Thames at London. There are a great number of public fountains, and some triumphal arches. Of the squares, the finest is the Place de Louis Quinze, of an octagon form, in which was an equestrian statue, in bronze, of that monarch. This square, now called the Place de la Revolution, was the fatal scene of the execution of Louis XVI. and of his consort Marie Antoinette, and of his sister the princess Elisabeth. Besides the cathedral of Notre Dame, one of the largest in Europe, Paris has many fine churches. The abbey of St. Genevieve was founded by king Clovis, whose monument is still to be seen in the church; it has a library of 24,000 printed books and 2000 manuscripts, also a valuable cabinet of antiquities and natural curiosities. The new church of St. Genevieve (now called the Pantheon) was destined by the national assembly, in 1791, to receive the remains of such great men as had merited well of their country.

The Bastile, built as a fortress by Charles V. lately served for a state prison; but it was destroyed by the people, in the beginning of the revolution. The university, founded by Charles the fat, consists of four faculties; namely, divinity, the civil and canon law, physic, and the sciences: its head is the rector, who is always chosen from the faculty of the sciences. The finest college in Paris is that of the Four Nations, called also Mazarin, from the cardinal, its founder. Among the public libraries, that lately called the royal holds the first rank, in respect both to the extent of the buildings, and the number of volumes. The royal observatory is built of freestone, and neither iron nor wood has been employed in the erection. The botanical garden is worthy of its appellation of royal. The four principal palaces are the Louvre, the Thuilleries, the Palais Royal, and the Luxembourg. In the Louvre is deposited the finest collection of paintings and statues in the world; the principal of them lately brought from various parts of Italy. The garden of the Thuilleries, in front of the palace and on the banks of the Seine, is the finest public walk in Paris. The Palais Royal was long the property of the dukes of Orleans; and the interior courts have been embellished with many beautiful buildings, with shops, coffeehouses, and a garden, which render it like a perpetual fair. The Luxembourg is famous for its gallery, in which are twenty exquisite paintings by Rubens. The Hospital-general, which also goes by the name of la Salpêtrerie (saltpetre being formerly made here), is a most noble foundation for the female sex; near 7000 of whom are here provided for, and live under the inspection of sixty sisters. To this incomparable foundation belongs the castle of Bicestres, defended on all sides by a wall, of considerable circuit, which contains within it many large buildings and several open places; and here near 4000 persons of the other sex are maintained. The Hospital de la Pietie, where poor children are brought up, constitutes also a part of the Hospital-general. These three foundations, with the Hotel Dieu, have one common fund, amounting to full two millions of livres a year. The Hotel des Invalides, for the wounded and superannuated soldiery, built by Lewis XIV. is a magnificent structure; as is the military school in the Champ de Mars, founded by Lewis XV. The two principal theatres are the Theatre de la Nation and the Italian theatre; which, in point of elegance and convenience, are worthy of the capital of a great nation. The Monnoie, or mint, is also a noble building, situate on that side of the Seine, opposite the Louvre. The Samaritan is a beautiful edifice, at the end of the bridge leading to the Louvre, and contains an engine for conveying the water of the Seine to all the parts of the villa. The Hotel de Ville is an ancient structure; this tribunal stands in the Place de Greve, where all public rejoicings are celebrated, and common malefactors executed. The most interesting of the manufactures of Paris is plate-glass, and tapestries made

after the pictures of the greatest masters. In the environs are excellent freestone and abundance of gypsum. Paris now forms, with a small district round it, one of the departments of France. It is 210 miles S.S.E. of London, 625 W. of Vienna, and 630 N.N.E. of Madrid, Lon. 2. 20 E. Lat. 48. 50 N.

PARIS, a town of Kentucky, chief of Bourbon county, situate in a fine plain, watered by a small river, 30 miles E. of Frankfort.

PARIS (Department of), one of the new divisions of France, including the city of Paris, and its immediate environs.

PARIS. Herb-Paris, or true-love. In botany, a genus of the class octandria, order tetragynia. Calyx four-leaved; petals four, narrower than the calyx; berry superior, four-celled; anthers growing to the middle of the filaments. One species: *P. quadrifolia*, indigenous to the woods of our own country. The colour and smell of this plant indicate its possessing narcotic powers. The leaves and berries are said to be efficacious in the cure of hooping cough, and to act like opium. Great caution is requisite in their exhibition, as convulsions and death are caused by an overdose. The root possesses emetic qualities.

PARIS (Plaster of). See PLASTER.

PARISH, the precinct of a parochial church, or a circuit of ground inhabited by people who belong to one church, and are under the particular charge of its minister. The word comes from the Latin *parochia*, the Greek *παροικια*, habitation; compound of *παρ*, near, *οικος*, house. Accordingly Du Cange observes, that the name *παροικια* was anciently given to the whole territory of a bishop, and derives it from neighbourhood; because the primitive christians not daring to assemble openly in cities, were forced to meet secretly in neighbour-houses.

In the ancient church there was one large edifice in each city for the people to meet in; and this they called *parochia*, parish. But the signification of the word was afterwards enlarged, and by a parish was meant a diocese, or the extent of the jurisdiction of a bishop, consisting of several churches; unless we will suppose, as somedo, that those bishops were only pastors of single churches. Du Pin observes, that country parishes had not their origin before the 4th century; but those of cities are more ancient. The city of Alexandria is said to have been the first that was divided into parishes.

It seems pretty clear and certain, says judge Blackstone (Com. vol. i. p. 112), that the boundaries of parishes were first ascertained by those of a manor or manors; because it very seldom happens that a manor extends itself over more than one parish, though there are often many manors in one parish. The lords, he adds, as christianity spread, began to build churches upon their own demesnes or wastes, in order to accommodate their tenants in one or two adjoining lordships; and that they might have divine service regularly performed therein, obliged all their tenants to appropriate their tithes to the maintenance of the one officiating

P A R

minister, instead of leaving them at liberty to distribute them among the clergy of the diocese in general; and this tract of land, the tithes of which were so appropriated, formed a distinct parish; and this accounts for the frequent intermixture of parishes one with another. For if a lord had a parcel of land detached from the main of his estate, but not sufficient to form a parish of itself, it was natural for him to endow his newly erected church with the tithes of such lands. Extra parochial wastes and marsh land, when improved and drained, are by 17 Geo. II. cap. 37. to be assessed to all parochial rates in the parish next adjoining. Camden reckons 9284 parishes in England; and Chamberlayne makes 9912. They are now generally reckoned nearly 11,000. See **BENEFICE** and **NON-RESIDENT**.

PARISH-CLERK. In every parish the parson, vicar, &c. hath a parish-clerk under him, who is the lowest officer of the church. These were formerly clerks in orders, and their business at first was to officiate at the altar; for which they had a competent maintenance by offerings; but they are now laymen, and have certain fees with the parson on christenings, marriages, burials, &c. besides wages for their maintenance. The law looks upon them as officers for life: and they are chosen by the minister of the parish, unless there is a custom for the parishioners or church-wardens to choose them; in which case the canon cannot abrogate such custom; and when chosen, it is to be signified, and they are to be sworn into their office by the archdeacon, for which the court of king's bench will grant a mandamus.

PARISH. *a.* 1. Belonging to the parish; having the care of the parish (*Ayliffe*). 2. Maintained by the parish (*Gay*).

PARISHIONER. *s.* (*paroissien*, French, from *parish*.) One that belongs to the parish.

PARISTHMA. (*παριστα*, near, and *ισθμος*, the tonsils and their vicinity.) In medicine, a disease of the tonsils; a quincy.

PARITOR. *s.* (for *apparitor*.) A beadle; a summoner of the courts of civil law (*Dryd.*).

PARITY. *s.* (*parité*, Fr. *paritas*, Latin.) Equality; resemblance (*Hall*).

PARIUM, a noble city of Mysia Minor, with a port on the Propontis; called Adrastia by Homer, according to Pliny; but Strabo distinguishes them: according to others, the Paestos of Homer. Pariani, the people (*Strabo*). The birthplace of Neoptolemus surnamed Glossographus (*Strabo*). Here stood a Cupid equal in exquisite workmanship to the Cnidian Venus.

PARK, an extensive tract of ground, or country, enclosed with wall or paling, well variegated with wood and water, for the support of cattle, and preservation of venison and game. It becomes a park by the privilege of prescription, or by the king's grant. There are many parks in possession of the crown (as well as of opulent individuals), of all which Windsor great park is the largest in the kingdom. It is upon record, that the park of Woodstock was the

P A R

first in England, formed and enclosed about the year 1124, and bounded by a stone wall seven miles in circumference. The example was followed by Henry Earl of Warwick; after which park-making became a common practice in different parts of the country.

To a park three things are required. 1. A grant thereof. 2. Inclosure by pale, wall, or hedge. 3. Beasts of a park; such as the buck, doe, &c. And where all the deer are destroyed, it shall no more be accounted a park; for a park consists of vert, venison, and inclosure; and if it is determined in any of them, it is a total disparking. Parks as well as chases are subject to the common law, and are not to be governed by the forest laws.

PARK LEAVES. In botany. See **HYPERICUM**.

PARK OF ARTILLERY. See **ARTILLERY**.

To PARK. *v. a.* (from the noun.) To enclose as in a park (*Shakspeare*).

PA'RKER. *s.* (from *park*.) A park keeper.

PARKER (Matthew), archbishop of Canterbury, was born at Norwich and educated at Cambridge, being first bible clerk or scholar, and afterwards fellow of Corpus Christi college in that university. He was chaplain to queen Anne Boleyn, who afterwards preferred him to the deanery of Stoke; afterwards he became chaplain to Henry VIII. and Edward VI. He was chosen master of his college to which he was a benefactor. By queen Mary he was deprived of all his preferments. In his retirement he wrote *A Defence of the Marriage of Priests*. On the accession of queen Elizabeth, he was consecrated archbishop of Canterbury. He solicited the queen to remove the crucifixes, lighted tapers, and images out of her own chapel. He improved the English translation of the bible, and had it printed on a larger paper, and dispersed through the kingdom. This is called the bishop's bible. He died in 1575, in his 72d year.

PARKER (Samuel), an English bishop, was born at Northampton in 1640, and lived at Wadham college, Oxford. He sided with the prevalent party after the example of his father, who having been bred to the law was made a member of the high court of justice in 1649, where he gave sentence against the lords Capel, Holland, and Hamilton, who were beheaded. During the protectorate he was made an assistant committee man for his county. In 1650, he published a treatise in defence of the new government as a commonwealth, without a king or house of lords, and was appointed by the rump parliament one of the barons of the exchequer; notwithstanding which, on the return of Charles II. he obtained a regular call as serjeant at law by the recommendation of chancellor Hyde. The son, Samuel, the subject of this article, had been bred among puritans, and entered into the society of Gruellers, a name given them for their constant fasting and praying. Upon the restoration, he became a zealous anti-puritan; and in the reign of James

II. he obtained the bishopric of Oxford. After this he was made a privy counsellor, and constituted by a royal mandamus president of Magdalen college, Oxford. He purchased these favours by complying with the king's commands, and writing some pieces which favoured the popish doctrine of transubstantiation and saint worship. He died in 1687.

PARKER (Henry, Lord Morley), in Henry the eighth's time was one of the barons who signed the memorable letter to Clement VII. threatening him with the loss of his supremacy in England, unless he proceeded to dispatch the divorce of the king. A list of his works may be seen in Mr. Walpole's (lord Orford's) Catalogue of royal and noble Authors, vol. 1.

PARKHURST (John), a learned English divine, was the second son of John Parkhurst, Esq. of Catesby-house, Northamptonshire. He was born in June, 1728, and educated first at Rugby, then at Clare-Hall, Cambridge, of which, in 1751, he was admitted fellow. He took his degrees in arts; and afterwards settled at Epsom, in Surrey. Mr. Parkhurst was the intimate friend of bishop Horne, and like him had a great partiality to the opinions of Hutchinson. He published a Greek and English Lexicon, 4to.; a Hebrew and English Lexicon, 4to.; and an answer to Dr. Priestley on the pre-existence of Christ. His Lexicons now published in 8vo. are very useful. He died in February, 1797. An interesting account of Mr. Parkhurst's life is prefixed to the later editions of his Greek Lexicon; from which we transcribe the following anecdote; as it shews the high sense he entertained of strict justice, and the steady resolution with which he practised it. One of his tenants falling behind-hand in the payment of his rent, which was 500l. per annum, it was represented to Mr. Parkhurst that it was owing to his being over-rented. This being believed to be the case, a new valuation was made: it was then agreed that, for the future, the rent should not be more than 450l. Justly inferring, moreover, that, if the farm was then too dear, it must necessarily have been always too dear; unasked, and of his own accord, he immediately struck off 50l. from the commencement of the lease; and instantly refunded all that he had received more than 450l. per annum.

PARKINSON (John), an English botanist, born in 1567. He was the first who singly described and figured the subjects of the flower garden. His *Theatrum Botanicum* contained a more copious history of physical herbs than any former publication: but his first work had a title which exhibited a pun or witticism upon his own name; it was called *Paridisi in sole, Paradisus terrestris*. *Paradisus* in sole meaning *Park-in-sun*.

PARKINSONIA. In botany, a genus of the class decandria, order monogynia. Calyx five-cleft; petals five, ovate, the lowermost kidney-form; styleless; legume moniliform. One species only; an American tree about twenty feet high, with prickly branches; long,

linear, pinnate leaves; flowers yellow on slender branches, of a most delightful scent.

PARLE. *s.* (from *parler*, French.) Conversation; talk; oral treaty (*Daniel*).

To PA'RLEY. *v. a.* (from *parler*, French.) To treat by word of mouth; to talk; to discuss any thing orally (*Broome*).

PA'RLEY. *s.* (from the verb.) Oral treaty; talk; conference; discussion by word of mouth (*Prior*).

PARLIAMENT, the grand assembly of the three estates of this kingdom; summoned together by the king's authority, to consider of matters relating to the public welfare, and particularly to enact and repeal laws.

The original or first institution of parliament is one of those matters which lie so far hidden in the dark ages of antiquity, that the tracing of it out is a thing equally difficult and uncertain. The word parliament itself (or colloquium, as some of our historians translate it) is, comparatively, of moderate date; derived from the French, and signifying "the place where they met and conferred together." It was first applied to general assemblies of the states under Louis VII. in France, about the middle of the 12th century. But it is certain, that, long before the introduction of the Norman language into England, all matters of importance were debated and settled in the great councils of the realm: a practice which seems to have been universal among the northern nations, particularly the Germans; and carried by them into all the countries of Europe, which they over-ran at the dissolution of the Roman empire, relics of which constitution, under various modifications and changes, are still to be met with in the diets of Poland, Germany, and Sweden, and lately in the assembly of the estates in France: for what was there called the parliament was only the supreme court of justice, consisting of the peers, certain dignified ecclesiastics, and judges; which neither was in practice, nor was supposed to be in theory, a general council of the realm.

In England, however, this general council hath been held immemorably, under the several names of *micel-synoth*, or great council; *micel-gemote*, or great meeting; and more frequently *wittena-gemote*, or the meeting of wise men. It was also styled in Latin, *commune concilium regni*; *magnum concilium regis*, *curia magna*, *conventus magnatum vel procerum*, *assisa generalis*, and sometimes *communitas regni Anglia*. We have instances of its meeting to order the affairs of the kingdom, to make new laws, and to amend the old, or, as Flea expresses it, *novis injuriis emersis nova constituere remedia*, so early as the reign of Ina king of the West Saxons, Offa king of the Mercians, and Ethelbert king of Kent, in the several realms of the heptarchy. And after their union, the Mirror informs us, that king Alfred ordained for a perpetual usage, that these councils should meet twice in the year, or oftener if need be, to treat of the government of God's people;

P A R L I A M E N T.

how they should keep themselves from sin, should live in quiet, and should receive right. Our succeeding Saxon and Danish monarchs held frequent councils of this sort, as appears from their respective codes of laws; the titles whereof usually speak them to be enacted, either by the king with the advice of his wittena-gemote, or wise men, as *Hæc sunt instituta, quæ Edgarus rex consilio sapientium suorum instituit*; or to be enacted by those sages with the advice of the king, as, *Hæc sunt iudicia, quæ sapientes consilio regis Ethelstani instituerunt*; or lastly, to be enacted by them both together, as *Hæc sunt institutiones, quas rex Edmundus et episcopi sui cum sapientibus suis instituerunt*.

There is also no doubt but these great councils were occasionally held under the first princes of the Norman line. Glanvil, who wrote in the reign of Henry II. speaking of the particular amount of an amercement in the sheriff's court, says, it had never yet been ascertained by the general assize or assembly, but was left to the custom of particular counties. Here the general assize is spoken of as a meeting well known, and its statutes or decisions are put in a manifest contradistinction to custom, or the common law. And in Edward III.'s time, an act of parliament, made in the reign of William the Conqueror, was pleaded in the case of the abbey of St. Edmund's-bury, and judicially allowed by the court.

Parliament, then, is the legislative branch of the supreme power of Great Britain, consisting of the king, the lords spiritual and temporal, and the knights, citizens, and burgesses, representatives of the commons of the realm, in parliament assembled.

The power and jurisdiction of parliament is so transcendent and absolute, that it cannot be confined, either for causes or persons, within any bounds.

The parliament must be summoned by the king, and not by authority of either house, at least forty days before it sits, although the convention parliament (the house of commons), from necessity, was summoned by the keepers of the liberty of England, by authority of parliament. It cannot begin without the king in person, or by representation. The principal privileges of parliament are the privilege of speech, which is essential to its existence, and to which there are no exceptions, except in some precedents of information filed for using free language during the reign of the second Charles, which it is to be hoped will never be drawn into authority, and the privilege of person from arrest and imprisonment for debt. This privilege lasts for forty days after the prorogation of the parliament, and forty days previous to its meeting. But all other privileges derogating from the common laws and matters of civil right are abolished by several statutes; and by 4 George III. c. 33, a trader, being a member of parliament, may be served with legal process for any just debt to the amount of one hundred pounds, and unless he makes satisfaction within two months, it shall be an

act of bankruptcy. Vide statutes 12 William III. c. 3.; 2 and 3 Ann, c. 18.; 11 George II. c. 24. Statute 10 George III. c. 50. 4 Geo. III. c. 33.

It is one of the privileges of the peers to be entitled to vote by proxy, and also to enter a protest against any bill to which they may dissent. But all money bills must commence with the commons; and it is now the custom, if any alteration is made by the lords in a money bill, for the commons to reject it and bring in another, even though the new bill should contain the regulation proposed by the lords.

The house of commons is a denomination given to the lower house of parliament. In a free state, every man who is supposed a free agent ought to be in some measure his own governor, and therefore a branch at least of the legislative power should reside in the whole body of the people. In elections for representatives for Great Britain, anciently, all the people had votes; but king Henry VI. to avoid tumults, first appointed that none should vote for knights but such as were freeholders, did reside in the county, and had forty shillings yearly revenue. In so large a state as ours, therefore, it is very wisely contrived that the people should do that by their representatives, which it is impracticable to perform in person; representatives chosen by a number of minute and separate districts, wherein all the voters, or may be, easily distinguished. The counties are therefore represented by knights, elected by the proprietors of lands; the cities and boroughs are represented by citizens and burgesses, chosen by the mercantile, or supposed trading interest of the nation.

The peculiar laws and customs of the house of commons relate principally to the raising of taxes, and the elections of members to serve in parliament.

The method of making laws is nearly the same in both houses. In the house of commons, in order to bring in the bill, if the relief sought be of a private nature, it is first necessary to prefer a petition, which must be presented by a member, and usually set forth a grievance required to be remedied. This petition, when founded on facts of a disputable nature, is referred to a committee of members, who examine the matter alleged, and accordingly report it to the house; and then (or otherwise upon the mere petition), leave is given to bring in the bill. In public matters the bill is brought in upon motion made to the house, without any petition. If the bill begin in the house of lords, if of a private nature, it is referred to two judges, to make report. After the second reading, the bill is said to be committed, that is, referred to a committee, which is selected by the house, in matters of small importance; or, upon a bill of consequence, the house resolves itself into a committee of the whole house: a committee of the whole house is composed of every member, and to form it the speaker quits the chair, and may consequently sit and debate upon the merits of it as a private member, another mem-

For being appointed chairman, for the time. In these committees the bill is usually debated clause by clause, amendments made, and sometimes it is entirely new modelled. Upon the third reading, further amendments are sometimes made, and if a new clause be added, it is done by tacking a separate piece of parchment on the bill, which is called a rider. The royal assent may be given two ways. 1. In person, when the king comes to the house of peers, in his crown and royal robes, and sending for the commons to the bar, the titles of all the bills that have passed both houses are read, and the king's answer is declared by the clerk of the parliament. If the king consent to a public bill, the clerk usually declares, *le roy le veut*, the king wills it so to be; if to a private bill, *soit fait comme il est desire*, be it as it is desired. If the king refuse his assent, it is in the gentle language of *le roy s'avisera*, the king will advise upon it. When a bill of supply is passed, it is carried up and presented to the king by the speaker of the house of commons, and the royal assent is thus expressed, *le roy remercie ses loyal sujets, accepte leur benevolence, et aussi le veut*, the king thanks his loyal subjects, accepts their benevolence, and also wills it so to be. By the statute 33 Henry VIII. c. 21, the king may give his assent by letters patent under his great seal, signed with his hand, and notified in his absence to both houses assembled together in the upper house. And when the bill has received the royal assent in either of these ways, it is then, and not before, a statute or act of parliament.

An act of parliament thus made is the exercise of the highest authority that this kingdom acknowledges upon the earth. It has power to bind every subject in the land, and the dominions thereunto belonging; nay even the king himself, if particularly named therein. And it cannot be altered, amended, dispensed with, suspended, or repealed, but in the same forms, and by the same authority of parliament.

Adjournment is no more than a continuance of the session from one day to another, as the word itself signifies; and this is done by the authority of each house separately every day, or for a longer period; but the adjournment of one house is no adjournment of the other.

Prorogation is the continuance of the parliament from one session to another, as an adjournment is a continuation of the session from day to day. And this is done by the royal authority, expressed either by the lord chancellor, in his majesty's presence, or by commission from the crown, or frequently by proclamation; and by this both houses are prorogued at the same time; it not being a prorogation of the house of lords or commons, but of the parliament. The session is never understood to be at an end until a prorogation; though, unless some act be passed, or some judgment given in parliament, it is, in truth, no session at all.

A dissolution is the civil death of the parliament; and this may be effected three ways; 1. by the king's will, expressed either in person, or representation; 2. by the demise of the

crown; 3. by length of time. By the king's will; for as the king hath the sole right of convening the parliament, so also it is a branch of the royal prerogative, that he may, whenever he pleases, prorogue the parliament for a time, or put a final period to its existence.

By the demise of the crown; a dissolution formerly happened immediately upon the death of the reigning sovereign; but the calling a new parliament immediately on the inauguration of the successor being found inconvenient, and dangers being apprehended from having no parliament in being, in case of a disputed succession; it was enacted by statutes 7 and 8 William III. c. 15, and 6 Anne, c. 7, that the parliament in being shall continue for six months after the death of any king or queen, unless sooner prorogued or dissolved by the successor. That if the parliament be, at the time of the king's death, separated by adjournment or prorogation, it shall notwithstanding assemble immediately; and that if no parliament is then in being, the members of the last parliament shall assemble and be again in parliament. Lastly, a parliament may be dissolved or expire by length of time.

The utmost extent of time that the same parliament was allowed to sit by the statute of 6 William, c. 3, was three years, after the expiration of which, reckoning from the return of the first summons, the parliament was to have no longer continuance. But by statute 1 George I. c. 38, in order, as it was alleged, to prevent the great and continued expenses of frequent elections, and the violent heats and animosities consequent thereupon, and for the peace and security of the government just then recovering from the last rebellion, this term was prolonged to seven years. So that as our constitution now stands, the parliament must expire, or die a natural death, at the end of every seventh year, if not sooner dissolved by the royal prerogative. In favour of liberty, however, it were much to be wished that this statute had never been passed. The pretexes which it assigns, as the grounds upon which it was passed, are by no means satisfactory.

PARLIAMENT (the High Court of), is the supreme court of the kingdom, not only for the making, but also for the execution of laws, by the trial of great and enormous offenders, whether lords or commons, in the method of parliamentary impeachment. An impeachment before the lords, by the commons of Great Britain in parliament, is a prosecution of the already known and established law, and has been frequently put in practice; being a presentment to the most high and supreme court of criminal jurisdiction, by the most solemn grand inquest of the whole kingdom. A commoner cannot, however, be impeached before the lords for any capital offence, but only for high misdemeanors; a peer may be impeached for any crime. And they usually, in case of an impeachment of a peer for treason, address the crown to appoint a lord high steward, for the greater dignity and regularity of their proceedings; which high steward was formerly elected by the peers themselves, though

he was generally commissioned by the king; but it has of late years been strenuously maintained, that the appointment of a high steward in such cases is not indispensably necessary; but the house may proceed without one. The articles of impeachment are a kind of bills of indictment, found by the house of commons, and afterwards tried by the lords; who are in cases of misdemeanors considered not only as their own peers, but as the peers of the whole nation.

Much has been said and written upon the question of parliamentary reform, and the actual state of the parliament. The result of a candid inquiry will be this; namely, that the parliament, which has been, and now is the guardian of the liberties of the people, may hereafter by corruption become the means of their destruction, or the cause of their being surrendered, and the parliament itself have only a nominal existence. To prevent this, the people can only depend upon the frequent necessity of their representatives appealing to them for a renewal of their powers; that is, upon the frequency of elections, which in order also to be free should be made by as large a body of voters as possible, and that what are called rotten boroughs should at once be abolished. To object to this that it is an infringement of chartered rights, is an insult to common sense; for all charters are void that are against common right, and the only object of elections is for the benefit of the many, not for the private advantage of the few. That the present state of the representation of the people is not such as it ought to be, has been too generally admitted to be insisted upon here; but let it never be forgotten, that amongst those who have considered it as defective we must number Mr. Pitt, Mr. Fox, and the commentator Blackstone. In any future revision of the laws against bribery and corruption, it would be well to make the elected as well as the electors take the oath against bribery; and still further to narrow, though not wholly to exclude, the admission of placemen and contractors to seats in the house of commons. If the freedom of the press can be fully preserved, or obtained, we may venture to hope that every thing will ultimately be effected which the rational friends of freedom can desire; but a knowledge of our history will teach us, that little is to be gained for liberty by adherence to any precedents drawn from proceedings before the Revolution, the true principles of which seem the only genuine basis on which to rest the foundation of British liberty.

We shall conclude this article with an account of some general forms not taken notice of under any of the above heads.

In the house of lords, the princes of the blood sit by themselves on the sides of the throne; at the wall on the king's right hand, the two archbishops sit by themselves on a form. Below them the bishops of London, Durham, and Winchester, and all the other bishops sit according to the priority of their consecration. On the king's left hand the lord

treasurer, lord president, and lord privy-seal, sit upon forms above all dukes except the royal blood; then the dukes, marquesses, and earls, according to their creation. Across the room are wool-sacks, continued from an ancient custom; and the chancellor, or keeper, being of course the speaker of the house of lords, sits on the first wool-sack before the throne, with the great seal or mace lying by him; below these are forms for the viscounts and barons. On the other wool-sacks are seated the judges, masters in chancery, and king's council, who are only to give their advice in points of law: but they all stand up till the king gives them leave to sit.

The commons sit promiscuously; only the speaker has a chair at the upper end of the house, and the clerk and his assistant sit at a table near him.

When a member of the house of commons speaks, he stands up uncovered, and directs his speech to the speaker only. If what he says be answered by another, he is not allowed to reply the same day, unless personal reflections have been cast upon him: but when the commons, in order to have a greater freedom of debate, have resolved themselves into a committee of the whole house, every member may speak to a question as often as he thinks necessary. In the house of lords they vote, beginning at the puisne or lowest baron, and so up orderly to the highest, every one answering, *content* or *not content*. In the house of commons they vote by *yeas* and *nays*; and if it be dubious, which are the greater number, the house divides. If the question be about bringing any thing into the house, the *yeas* go out; but if it be about any thing the house already has, the *nays* go out. In all divisions the speaker appoints four tellers, two of each opinion. In a committee of the whole house, they divide by changing sides, the *yeas* taking the right and the *nays* the left of the chair; and then there are but two tellers. If a bill pass one house, and the other demur to it, a conference is demanded in the painted chamber, where certain members are deputed from each house; and here the lords sit covered, and the commons stand bare, and debate the case. If they disagree, the affair is null; but if they agree, this, with the other bills that have passed both houses, is brought down to the king in the house of lords, who comes thither clothed in his royal robes; before him the clerk of the parliament reads the title of each bill, and as he reads, the clerk of the crown pronounces the royal assent or dissent. If it be a public bill, the royal assent is given in these words: *Le roy le veut*, "The king will have it so;" if private, *Soit fait comme il est désiré*, "Let the request be complied with;" if the king refuses the bill, the answer is *Le roy s'aviserà*, "The king will think of it;" and if it be a money-bill, the answer is, *Le roy remercie ses loyaux sujets, accepte leur benevolence, et aussi le veut*; "The king thanks his loyal subjects, accepts their benevolence, and therefore wills it."

PARLIAMENTARY. *a.* (from *parliament*.) Enacted by parliament; pertaining to parliament (*Bacon*).

PARLOUR. *s.* (*parloir*, French; *parlatorio*, Italian.) 1. A room in monasteries, where the religious meet and converse. 2. A room in houses on the first floor, elegantly furnished for reception or entertainment (*Spen.*).

PARLOUS. *a.* (from *perilous*.) Keen; sprightly; waggish (*Dryden*).

PARLOUSNESS. *s.* (from *parlous*.) Quickness; keenness of temper.

PARMA, the duchy of a province of Italy, bounded on the north by the Po; on the north-east by the Mantuan; on the east by the duchy of Modena; on the south by Tuscany; and on the west by the duchy of Placentia. The air is very wholesome, on which account the inhabitants live to a great age. The soil is very fertile in corn, wine, oil, and hemp; the pastures feed a great number of cattle, and the cheese is in very high esteem. Here are considerable mines of copper and silver, and plenty of truffles, which many are very fond of. The cheese called Parmesan is no longer made in this country, but at Lodi in the Milanese, at Trino, Bologna, and some other places.

PARMA, a fortified city of Italy, capital of a duchy of the same name, and a bishop's see, with a citadel, and a university. It has a magnificent cathedral, many beautiful churches, and handsome streets. The cupola of the cathedral, and the church of St. John, are painted by the famous Correggio, who was a native of this place; and in the church of la Madonna della Stoccata are the tombs of the Farnese family. The other most remarkable places are the ducal palace, with its gallery and collection of artificial curiosities; the celebrated opera house, capable of containing 14,000 spectators; the large Benedictine convent, in which 12,000 soldiers were quartered in 1734; the Palazzo Giardino, a ducal palace connected with the town; and the promenade, between the town and citadel. The inhabitants, about 38,000, trade in silk and silk stockings. In 1734 a battle was fought here between the Austrians and the French and Sardinians, in which the former were defeated. Parma is situate on a river of the same name, which divides it into two parts, united by three bridges, 40 miles N.W. of Modena, and 60 S.E. of Milan. Lon. 10. 30 E. Lat. 44. 50 N.

PARMENIDES, a Greek philosopher of Elis, who flourished about 505 years before Christ. He was the pupil of Xenophanes, or Anaximander according to some. He maintained that there were only two elements, fire and the earth; and taught that the first generation of men was produced from the sun. He first discovered that the earth was round, and that it was placed in the centre of the universe.

PARMENIO, a celebrated general in the armies of Alexander, who was more attached to his person as a man than as a monarch. When Darius king of Persia offered Alexander all the country west of the Euphrates, with

his daughter Statura in marriage, and 10,000 talents of gold, Parmenio observed that he would accept these conditions if he were Alexander; "So would I, were I Parmenio," replied Alexander. This friendship so inviolable was sacrificed at a moment of suspicion, and Alexander who had too eagerly listened to a light accusation, ordered Parmenio and his son to be put to death, as if guilty of treason. Parmenio died in the 70th year of his age, B. C. 330; and it has been judiciously observed, that Parmenio obtained many victories without Alexander, but Alexander not one without Parmenio.

PARMESAN CHEESE. See **CHEESE**.

PARNASSIA. Grass of Parnassus. In botany, a genus of the class pentandria, order tetragynia. Calyx five-parted; petals five; nectaries five, heart-shaped, fringed with bristles ending in globular tips: flower terminal, single and white streaked with yellow. Indigenous to the bogs of our own country; sometimes cultivated.

PARNASSUS, a mountain of Phocis, one of the highest in Europe, anciently called Larnassos, from the boat of Deucalion *καρυαξ*, which was carried there in the universal deluge. It received the name of Parnassus from Parnassus the son of Neptune, and was sacred to the Muses, and to Apollo and Bacchus. The mountain, according to the poets, had only two tops, called Hyampea and Tethorea, on one of which the city of Delphi was situated.

PARNELL (Dr. Thomas), a very ingenious divine and poet in the early part of last century. He was archdeacon of Clogher, and the intimate friend of Mr. Pope; who published his works, with an elegant copy of commendatory verses prefixed. He died in 1718, aged 39. Johnson says, "The life of Dr. Parnell is a task which I should very willingly decline, since it has been lately written by Goldsmith, a man of such variety of powers, and such felicity of performance, that he always seemed to do best that which he was doing; a man who had the art of being minute without tediousness, and general without confusion; whose language was copious without exuberance, exact without constraint, and easy without weakness.

"What such an author has told, who would tell again? I have made an extract from his larger narrative; and shall have this gratification from my attempt, that it gives me an opportunity of paying due tribute to the memory of a departed genius. 'Το γὰρ γένος ἐστὶ δαίμωνιον.'

"The general character of Parnell is not great extent of comprehension, or fertility of mind. Of the little that appears still less is his own. His praise must be derived from the easy sweetness of his diction: in his verses there is more happiness than pains; he is sprightly without effort, and always delights though he never ravishes; every thing is proper, yet every thing seems casual. If there is some appearance of elaboration in the Hermit, the narrative, as it is less airy, is less pleasing.

Of his other compositions it is impossible to say whether they are the productions of nature, so excellent as not to want the help of art, or of art so refined as to resemble nature."

PARNUS, in the entomology of Fabricius, a tribe of the coleopterous genus *ELATER*, which see.

PARO'CHIAL. *a.* (*parochialis*, from *parochia*, low Lat.) Belonging to a parish (*Atterbury*).

PARODY, a popular maxim, adage, or proverb.

PARODY is also a poetical pleasantry, consisting in applying the verses written on one subject, by way of ridicule, to another; or in turning a serious work into a burlesque, by affecting to observe as near as possible the same rhymes, words, and cadences. The parody was first set on foot by the Greeks; from whom we borrow the name. It comes near to what some of our late writers call travesty. Others have more accurately distinguished between a parody and burlesque; and they observe, that the change of a single word may parody a verse; or of a single letter a word. Thus, in the last case, Cato exposed the inconstant disposition of Marcus Fulvius Nobilior, by changing Nobilior into Mobilior. Another kind of parody consists in the mere application of some known verse or part of a verse of a writer, without making any change in it, with a view to expose it. A fourth instance is that of writing verses in the taste and style of authors little approved.

PAROLE. *s.* (*parole*, Fr.) Word given as an assurance; promise given by a prisoner not to go away (*Cleveland*).

PARONOMA'SIA. *s.* (*παρωνομασια*.) A rhetorical figure, in which, by the change of a letter or syllable, several things are alluded to.

PARONYCHIA. (*παρωνυχια*; from *παρ*, about, and *ονυξ*, the nail.) Panaris. Panaritium. A whitlow, or whitloe. Any collection of pus formed in the fingers is termed by authors panaris, or whitloe, and is an abscess of the same nature with those arising in other parts of the body. These abscesses are situated more or less deep, which has induced the writers upon the subject to divide them into several species: accordingly they have ranged them under four heads, agreeable to the places where they are formed. The first kind of panaris is formed under the cuticle, on one side of the nail, and sometimes all round it. The second is seated in the fat lying under the skin, between that and the sheath which involves the flexor tendons. The third is described by authors to be formed within the sheath; and they still add a fourth species, arising between the periosteum and the bone.

PARONYMOUS. *a.* (*παρωνυμος*.) Resembling another word (*Watts*).

PAROQUET. *s.* (*parroquet*, or *perroquet*, Fr.) A small species of parrot (*Grew*).

PARORCHIDIUM. (*παρορχιδιον*; from *παρ*, and *ορχις*, a testicle.) A tumour in the groin, occasioned by the testicle, which is passing into the scrotum.

PAROS, a celebrated island among the Cyclades. Pliny says it is about 36 miles in circumference. It received the name of Paros, which it still bears, from Paros, a son of Jason, or as some maintain, of Parrhasius. The island of Paros was rich and powerful, and well known for its famous marble, always used by the best statuary. Here modern travellers see quarries of a most extraordinary depth, whence the labyrinth of Egypt, and the porticoes of Greece received their splendor; they were so uncommonly deep, that in the clearest weather the workmen were obliged to use lamps. Paros is also famous for the fine cattle which it produces, and for its partridges and wild pigeons. The capital city was called Paros. The poet Archilochus was born there. The Arundelian marbles were engraved in this island in capital letters, B. C. 204, and as a valuable chronicle, preserved the most celebrated epochas of Greece from the year 1582, B. C.

PAROS, a town of the Archipelago, capital of the isle of Paros. It was anciently the largest and most powerful town of the Cyclades; but is greatly decayed. The walls of the castle are built of ancient pieces of marble, and most of the columns are placed longwise: some of them that stand upright support cornices of amazing size. The natives build their houses of marble, which they find ready cut to their hands; but they take no care to place the pieces in a regular manner: their fields likewise are inclosed with friezes, altars, and basso relievos. The inhabitants are so ignorant now, that, instead of great sculptors and skilful architects, they have nothing but carvers of mortars and salt-cellars. Paros is a bishop's see, and situate on the W. coast of the island. Lon. 25. 44 E. Lat. 37. 8 N.

PAROTID GLAND. (from *παρ*, about, and *ος*, the ear.) A large conglomerate and salivary gland, situated under the ear, between the mamillary process of the temple bone, and the angle of the lower jaw. The excretory duct of this gland opens in the mouth, and is called, from its discoverer, the Stenonian duct.

PAROXYSM. (*παροξυσμος*; from *παροξυνω*, to aggravate.) A periodical exacerbation or fit of a disease.

PARR (Catherine), sixth queen to Henry VIII. was daughter of sir Thomas Parr, and widow of lord Latimer. She was well skilled in divinity, upon which she frequently conversed with the king. She laboured much for the establishment of the reformation, and her interference proved at one time so disagreeable to the monarch, that he permitted Gardiner to draw articles of impeachment against her, but her prudence restored her to the affection of the king. After Henry's death she married sir Thomas Seymour, who treated her with great harshness, so that she died the next year in child-bed, not without suspicion of poison, 1548.

PARR (Thomas), a peasant of Shropshire, who lived to the great age of 152 years and nine months. He performed penance in his

parish church at the age of 105 for a bastard child, and at 120 he married a second wife, by whom he had a child. He was in 1635 brought to London, and introduced to Charles I, but the change of situation, and particularly drinking wine, proved fatal to a constitution hitherto supported by more temperate and abstemious habits, and he died the same year.

The following summary of his life is copied from Oldys's MS. notes on Fuller's Worthies: Old Parr was born 1483; lived at home until 1500, aged 17, when he went out to service; 1518, aged 35, returned home from his master; 1522, aged 39, spent four years on the remainder of his father's lease: 1543, aged 60, ended the first lease he renewed of Mr. Lewis Porter; 1563, aged 80, married Jane, daughter of John Taylor, a maiden; by whom he had a son and a daughter, who both died very young; 1564, aged 81, ended the second lease which he renewed of Mr. John Porter; 1585 aged 102, ended the third lease he had renewed of Mr. Hugh Porter; 1588, aged 105, did penance in Alderbury church, for lying with Katharine Milton, and getting her with child; 1595, aged 112, he buried his wife Jane, after they had lived 32 years together; 1605, aged 122, having lived ten years a widower, he married Jane, widow of Anthony Adda, daughter of John Lloyd of Gilsells, in Montgomeryshire, who survived him; 1635, aged 152, he died; after they had lived together 30 years, and after 50 years possession of his last lease. See LONGEVITY.

PARRA. Jacana. In zoology, a genus of the class aves, order grallæ. Bill tapering, somewhat obtuse; nostrils oval, in the middle of the bill; front covered with lobate caruncles; wings spinous. Sixteen species, natives of the warmer parts of Asia, Africa, and America. The following are examples:

1. *P. Chilensis.* Chilese jacana. Claws moderate; legs brown; hind-head subcrested; bill conic, two inches long, a little curved at the tip; irids yellowish; nostrils pervers, square; caruncle two-lobed, red; neck, back and fore-part of the wings violet; throat and breast black; wings and short tail brown; spurs on the wings yellowish, conic, bony, half an inch long. Inhabits Chili; size of a jay, but the legs longer; feeds on worms and insects; is noisy, and defends itself by the spurs on its wings; builds in the grass, and lays four tawny eggs, speckled with black.

2. *P. jacana.* Chesnut jacana. Hind-claws very long; legs greenish; bill tawny; body chesnut-purple; head and neck beneath violet-black; quill-feathers olive-green, edged at the tip with brown; tail-feathers at the tip black-violet, two middle ones varied with bay and brown; spurs on the wings strong, yellow; caruncle orange, two-parted, hanging each side the head. Inhabits watery places of South America; ten-inches long; is very noisy, and continually making a shrill cry; generally seen in pairs; flesh good.

3. *P. chavaria.* Faithful jacana. Toes long; legs tawny; hind-head crested; bill

dirty-white, upper mandible like that of the dung-hill cock; on both sides at the base of the bill a red membrane extending to the temples, in the middle of which are the eyes; irids brown; crest on the hind-head consists of about twelve black feathers, three inches long, pendent; rest of the neck covered with thick black down; body brown, wings and tail blackish; wing-spurs two or three half an inch long; belly light black; thighs half bare; toes so long as to entangle each other in walking. Inhabits the rivers and inundated places near Carthage in America; feeds on herbs; its gait is slow, and it cannot run unless assisted by the wings, but flies easily and swiftly. When the skin is touched a crackling is felt; voice clear and loud. The natives keep one of these birds tame to wander with the poultry and defend them against birds of prey, which it does by means of the spurs on its wings. It never deserts the charge committed to its care, but brings them home at night. It will readily suffer itself to be handled by adults, but not by children; is about the size of a cock, and stands a foot and half from the ground. See Nat. Hist. Pl. CLXI.

PARRAKEET, in ornithology. See *Pica*.

PARRAMATTA, a town or settlement of English convicts in New South Wales. It is seated at the head of the harbour of Port Jackson, 11 miles W. of Sydney Cove, between Rose Hill and the landing-place in the creek which forms the head. In 1791, near 1000 acres of land were either in cultivation, or cleared for that purpose; and the soil, in most places, was found to be remarkably good. Lon. 151. 39 E. Lat. 33. 50 S.

PARRELS, in a ship, are frames made of trucks, ribs, and ropes, which having both their ends fastened to the yards, are so contrived as to go round about the masts, that the yards by their means may go up and down upon the mast. These also, with the breast-ropes, fasten the yards to the masts.

PARRET, a river in Somersetshire, which rises in the S. part of the county, receives the Ivel and Thone, and enters the Bristol Channel, at Bridgewater Bay.

PARRHASIA, a town of Arcadia, founded by Parrhasius, the son of Jupiter. The Arcadians are sometimes called Parrhasians, and Arcas Parrhasis.

PARRHASIUS, a famous painter of Ephesus in the age of Zeuxis, about 415 years before Christ. He particularly excelled in strongly expressing the violent passions. He had much invention, and was peculiarly happy in his designs. He once entered the lists against Zeuxis, and when they had produced their respective pieces, the birds came to pick the grapes which Zeuxis had painted. Immediately Parrhasius exhibited his piece, and Zeuxis said, "Remove your curtain, that we may see the painting." The curtain was the painting, and Zeuxis acknowledged himself conquered by exclaiming, "Zeuxis has deceived birds, but Parrhasius has deceived Zeuxis himself."

PARRHASIUS (James), an Italian grammarian, born at Cosenza, 1470. He taught belles lettres and rhetoric at Milan, where he was much admired for his graceful delivery. On a charge of improper converse with his pupils, he retired to Vicenza, and afterwards to Rome. His application soon rendered him incapable of acting as professor, and upon his return home he fell into a fever, which proved fatal. He wrote some fragments of antiquity—commentaries on Horace's art of poetry—Ovid's—Claudian, &c.

PARRICIDE. *s.* (*parricide*, Fr.) 1. One who destroys his father (*Shakspeare*). 2. One who destroys or invades any to whom he owes particular reverence. 3. The murder of a father; murder of one to whom reverence is due (*Dryden*).

PARRICIDAL. **PARRICIDIOUS**. *a.* (from *parricida*, Lat.) Relating to parricide; committing parricide (*Brown*).

PARROCEL (Joseph), of Brignoles in Provence, was eminent as a painter and engraver. He studied under one of his brothers, and under Bourignon, and was admitted member of the French academy of painting. His portraits, and also his historical pieces, and his battles were executed with great taste and effect. He died 1704, aged 56. His son Charles was also an eminent artist, and died 1752, aged 53. His conquests of Louis XV. possess merit.

PARROT. In ornithology. See **PICA**.

To **PARRY**. *v. n.* (*parer*, French.) To put by thrusts; to fence (*Locke*).

To **PARSE**. *v. a.* (from *pars*, Lat.) To resolve a sentence into the elements or parts of speech (*Ascham*).

PARSHORE, a neat old town in Worcester-shire, having formerly an abbey church. At present it has two parishes, Holy Cross and St. Andrew; it contains about 320 houses; and has markets on Tuesdays and Saturdays.

PARSIMONIOUS. *a.* (from *parsimony*.) Covetous; frugal; sparing (*Addison*).

PARSIMONIOUSLY. *ad.* Covetously; frugally; sparingly (*Swift*).

PARSIMONIOUSNESS. *s.* (from *parsimonious*.) A disposition to spare and save.

PARSIMONY. *s.* (*parsimonia*, Lat.) Frugality; covetousness; niggardliness; saving temper (*Swift*).

PARSLEY. In botany. See **APIUM**.

PARSLEY (Macedonian). See **BUBON**.

PARSLEY (Stone). See **BUBON**.

PARSNIP. In botany. See **PASTINACA**.

PARSON. *s.* (*parochianus*, Lat.) 1. The priest of a parish; one that has a parochial charge or cure of souls (*Clarendon*). 2. A clergyman (*Shakspeare*). 3. It is applied to dissenting teachers.

PARSON, and **VICAR**. A parson, *persona ecclesiæ*, is one that hath full possession of all the rights of a parochial church. He is called parson, *persona*, because by his person the church, which is an invisible body, is represented; and he is in himself a body corporate, in order to protect and defend the rights of the

church (which he personates) by a perpetual succession. He is sometimes called the rector or governor of the church: but the appellation of parson (however it may be depreciated by familiar, clownish, and indiscriminate use) is the most legal, most beneficial, and most honourable title that a parish-priest can enjoy; because such a one (sir Edward Coke observes), and he only, is said *vicem seu personam ecclesiæ gerere*. A parson has, during his life, the freehold in himself of the parsonage house, the glebe, the tithes, and other dues. But these are sometimes appropriated; that is to say, the benefice is perpetually annexed to some spiritual corporation, either sole or aggregate, being the patron of the living; whom the law esteems equally capable of providing for the service of the church as any single private clergyman. See **APPROPRIATION**.

The appropriating corporations, or religious houses, were wont to depute one of their own body to perform divine service, and administer the sacraments, in those parishes of which the society was thus the parson. This officiating minister was in reality no more than a curate, deputy, or vicegerent of the appropriator, and therefore called *vicarius*, or vicar. His stipend was at the discretion of the appropriator, who was, however, bound of common right to find somebody, *qui illi de temporalibus, episcopo de spiritualibus debeat respondere*. But this was done in so scandalous a manner, and the parishes suffered so much by the neglect of the appropriators, that the legislature was forced to interpose: and accordingly it is enacted, by statute 15 Richard II. c. 6. that in all appropriations of churches, the diocesan bishop shall ordain (in proportion to the value of the church) a competent sum to be distributed among the poor parishoners annually; and that the vicarage shall be sufficiently endowed. It seems the parish were frequently sufferers, not only by the want of divine service, but also by withholding those alms for which, among other purposes, the payment of tithes was originally imposed: and therefore in this act a pension is directed to be distributed among the poor parochians, as well as a sufficient stipend to the vicar. But he, being liable to be removed at the pleasure of the appropriator, was not likely to insist too rigidly on the legal sufficiency of the stipend; and therefore, by statute 4 Henry IV. c. 12. it is ordained, that the vicar shall be a secular person, not a member of any religious house; that he shall be vicar perpetual, not removable at the caprice of the monastery; and that he should be canonically instituted and inducted, and be sufficiently endowed, at the discretion of the ordinary, for these three express purposes: to do divine service, to inform the people, and to keep hospitality. The endowments, in consequence of these statutes, have usually been by a portion of the glebe or land belonging to the parsonage, and a particular share of the tithes, which the appropriators found it most troublesome to collect, and which are therefore generally called petty or small tithes; the greater, or parial tithes,

being still reserved to their own use. But one and the same rule was not observed in the endowment of all vicarages. Hence some are more liberally, and some more scantily, endowed: and hence the tithes of many things, as wood in particular, are in some parishes rectorial, and in some vicarial tithes.

The distinction therefore of a parson and vicar is this: the parson has for the most part the whole right to all the ecclesiastical dues in his parish; but a vicar has generally an appropriator over him, entitled to the best part of the profits, to whom he is in effect perpetual curate, with a standing salary. Though in some places the vicarage has been considerably augmented by a large share of the great tithes; which augmentations were greatly assisted by the statute 27 Charles-II. c. 8. enacted in favour of poor vicars and curates, which rendered such temporary augmentations (when made by the appropriators) perpetual.

The method of becoming a parson or vicar is much the same. To both there are four requisites necessary; holy orders, presentation, institution, and induction.

For the rights of a parson or vicar, in his tithes and ecclesiastical dues, see **TITHES**. As to his duties, they are so numerous, that it is impracticable to recite them here with any tolerable conciseness or accuracy; but the reader who has occasion may consult bishop Gibson's *Codex*, Johnson's *Clergyman's Vade Mecum*, and Burn's *Ecclesiastical Law*. We shall therefore only just mention the article of residence, upon the supposition of which the law doth style every parochial minister an incumbent. By statute 21 Henry VIII. c. 13. persons willingly absenting themselves from their benefices, for one month together, or two months in the year, incur a penalty of 5*l*. to the king, and 5*l*. to any person that will sue for the same; except chaplains to the king, or others therein mentioned, during their attendance in the household of such as retain them; and also except all heads of houses, magistrates, and professors in the universities, and all students under forty years of age residing there, *bona fide*, for study. Legal residence is not only in the parish, but also in the parsonage house; for it hath been resolved, that the statute intended residence, not only for serving the cure and for hospitality, but also for maintaining the house, that the successor also may keep hospitality there.

We cannot terminate this article without recommending to those who have thoughts of entering the clerical profession the perusal of Izaak Walton's *Life of George Herbert*, rector of Bemerton; the same Mr. Herbert's admirable piece called *A Priest to the Temple*, or the Country Parson; the *Life of Hooker*, prefixed to his *Ecclesiastical Polity*; Burnet's *Pastoral Care*; Mason's *Pastor and Student*; and Dr. Campbell's *Lectures on the Pastoral Character*.

PARSONAGE. *s.* (from *parson*.) The benefice of a parish; a rectory (*Addison*).

PARSONS (Robert), or **PERSONS**, son of a

blacksmith near Bridgewater, was born 1646, and educated at Baliol college, Oxford, at the expence of the vicar of his parish. He became fellow and tutor of his college; but being accused of incontinence, and of embezzling the college money, he left the university, and retired to Antwerp, then to Louvain and Padua, and afterwards to Rome, where he renounced the protestant faith, and entered among the jesuits. The pope permitted him to establish an English college at Rome, for the instruction of missionaries to attempt the conversion of the English nation. He came himself in disguise to London; but his violent attack against the religion of England, and the doctrine that Elizabeth might safely be deposed, were too daring to be long concealed from Burleigh, yet he escaped his pursuers. On the preparations of Philip to invade England, the good father stirred up not only foreigners, but natives, against their country; and when the armada was destroyed, he endeavoured to excite a rebellion in the kingdom. This insidious, and intriguing jesuit, died 1610. His writings were 33 tracts, chiefly on divinity and controversial subjects.

PARSONS (James), a learned physician, born at Barnstaple, in Devonshire, in 1705. His father being appointed barrack-master, at Bolton, in Ireland, he received his education in Dublin; from whence he went to Paris, where he attended Astruc, and others equally eminent, as also the chemical lectures of Lemery and Bouldue, and those of botany, by Jussieu. He went to the university of Rheims, in Champagne, and obtained his degrees in 1736. In July of the same year, he came to London, and in 1740, was elected a member of the royal society. In 1751, he was admitted a licentiate of the college of physicians. Through the interest of his friend Dr. Douglas he was appointed physician to the infirmary of St. Giles's. He died after a week's illness, 1770, universally regretted.

PART. *s.* (*pars*, Lat.) 1. Something less than the whole; a portion; a quantity taken from a larger quantity (*Knolles*). 2. Member (*Locke*). 3. Particular; distinct species (*Law*). 4. Ingredient in a mingled mass (*Blackmore*). 5. That which, in division, falls to each (*Dryden*). 6. Proportional quantity (*Chapman*). 7. Share; concern (*Pope*). 8. Side; party; interest; faction (*Daniel*). 9. Something relating or belonging (*Shakspeare*). 10. Particular office or character (*Bacon*). 11. Character appropriated in a play (*Shakspeare*). 12. Business; duty (*Bacon*). 13. Action; conduct (*Shakspeare*). 14. Relation reciprocal (*Tillotson*). 15. In good part; in ill part; as well done; as ill done (*Hooker*). 16. (In the plural.) Qualities; powers; faculties; or accomplishments (*Sidney*). 17. (In the plural.) Quarters; regions; districts (*Sidney*). 18. For the most part. Commonly; oftener than otherwise (*Heylin*).

PART, in music, the name of each of the melodies of any harmonic composition, and which, when performed in union, form its

harmony. Four is the fewest number of parts with which the chords necessary to elaborate harmony can be completely filled.

At the first introduction of counterpoint there were only two parts, one of which was called tenor, and the other discant. At length a third was added called triplum, and afterwards a fourth called quadruplum. There are instrumental parts; as organ part, violin part, violoncello part, &c. and the paper or book on which is separately written the particular melody appropriated to any single performer, or set of performers of the same melody, is called a part. In concert, every performer, except the composer, or conductor, who generally uses the score, sings or plays from his single part.

PARTS OF VEGETABLES (Primary), are, 1. The root, descending, imbibing fluid, nourishing. 2. The herb, ascending, breathing air, moving. 3. The fructification, expanding, inhaling ether, generating.

PARTS OF SPEECH, in grammar. See GRAMMAR.

PART. ad. Partly; in some measure (*Shakespeare*).

To **PART. v. a.** 1. to divide; to share; to distribute (*Acts*). 2. To separate; to disunite (*Dryden*). 3. To break into pieces (*Leviticus*). 4. To keep asunder (*Shaks.*). 5. To separate combatants (*Shakspeare*). 6. To seceren (*Prior*).

To **PART. v. n.** 1. To be separated (*Dryden*). 2. To quit each other (*Swift*). 3. To take farewell (*Shakspeare*). 4. To have share (*Isaiah*). 5. (*partir, Fr.*) To go away; to set out (*Dryden*). 6. To **PART with.** To quit; to resign; to lose; to be separated from (*Tay.*).

PARTABLE. a. (from *part.*) Divisible; such as may be parted (*Camden*).

PARTAGE. s. (*partage, Fr.*) Division; act of sharing or parting (*Locke*).

To **PARTAKE. v. n.** preterit, *partook*; participle passive, *partaken.* (*part* and *take.*) 1. To have share of any thing; to take share with (*Locke*). 2. To participate; to have something of the property, nature, claim, or right (*Bacon*). 3. To be admitted to; not to be excluded (*Shakspeare*). 4. To combine; to unite in some bad design.

To **PARTAKE. v. a.** 1. To share; to have part in (*Milton*). 2. To admit to part; to extend participation to: obsolete (*Spenser*).

PARTAKER. s. (from *partake.*) 1. A partner in possessions; a sharer of any thing; an associate with (*Hooker*). 2. Sometimes with in before the thing partaken (*Shakspeare*). 3. Accomplice; associate (*Psalms*).

PARTER. s. (from *part.*) One that parts or separates (*Sidney*).

PARTERRE, in gardening, a level division of ground, which, for the most part, faces the south, and best front of a house; and is generally furnished with greens, flowers, &c.

PARTHENAY, a town of France, in the department of Two Sevres. It carries on a considerable trade in cattle and corn, and is seated on the Thoue, 17 miles S. of Thours. Lon. 0. 19 W. Lat. 46. 44 N.

PARTHENAY (Anne de), a lady of great genius and learning, and wife of Anthony de Pons, count de Marennnes. She was one of the brightest ornaments of the court of the duchess of Ferrara, being a proficient in the Latin and Greek languages. She was a follower of Calvin, and took great pains to propagate his principles.

PARTHENAY (Catharine de), niece of the above lady, and heiress to the lordship of Soubise; was married in 1568, at the age of 14, to the baron de Pons; and in 1575, to René, viscount Rohan. The famous duke de Rohan, who so courageously defended the protestant cause in France during the civil wars of Louis XIII. was her eldest son. Catharine, one of her three daughters, who married the duke of Deux-Ponts, made the following answer to Henry IV. her admirer, "I am too poor, sire, to be your wife, and too proud to be your mistress." She died in 1607.

PARTHENIÆ and **PARTHENI**, a certain number of desperate citizens of Sparta. They were the offspring of all the young men employed in the Messenian war, who had not taken an oath not to return to Sparta before Messenia was subdued. They left the army commissioned to raise a future generation by a familiar and promiscuous intercourse with all the unmarried women of the state, and the children sprung from this union were called Partheniæ, or sons of virgins (*παρθενος*). The Partheniæ, upon the return of the Spartans from the war, finding themselves despised on account of their illegitimacy, conspired with the Helots against the state, and, at length, with Phalantus their ring-leader at their head, they settled in Magna Græcia, and built Tarantum, about 707 years before Christ.

PARTHENIUM. Bastard-feverfew. In botany, a genus of the class syngenesia, order polygamia necessaria. Receptacle chaffy, flat; seeds obovate, mostly naked; calyx five-leaved: two species.

1. *P. hystrophorus.* Cut-leaved bastard feverfew: wild wormwood. An annual of the West Indies; possessing much the same qualities as common feverfew; flowering among us in July and August.

2. *P. integrifolium.* Entire-leaved parthenium. A perennial of Virginia, rising about three feet, with thick, round, fleshy stems, flowers corymbed and terminal, heads snow-white above, like those of gnaphalium, whitish-green below.

PARTHENIUS, a river of Paphlagonia, which, after separating Bithynia, falls into the Euxine sea, near Sesamum. It received its name either because the virgin Diana bathed herself there, or perhaps it received it from the purity and mildness of its waters.—2. A favourite of the emperor Domitian. He conspired against his imperial master, and assisted to murder him.

PARTHENON, a temple of Athens, sacred to Minerva. It was destroyed by the Persians, and afterwards rebuilt by Pericles, in a more magnificent manner. All the cir-

cumstances which related to the birth of Minerva were beautifully and minutely represented in bass-relief, on the front of the entrance. The statue of the goddess was 26 cubits high, and made of gold and ivory. It passed for one of the master-pieces of Phidias.

PARTHENOPEUS, a son of Meleager and Atalanta, was one of the seven chiefs who accompanied Adrastus the king of Argos in his expedition against Thebes. He was killed by Amphilichus.

PARTHENOPE, one of the Sirens.—A city of Campania, afterwards called Neapolis, or the new city, when it had been beautified by a colony from Eubœa. It is now called Naples. It received the name of Parthenope from one of the Sirens, whose body was found on the shore there.

PARTHIA, a celebrated country of Asia, bounded on the west by Media, south by Carmania, north by Hyrcania, and east by Aria, &c. containing, according to Ptolemy, 25 large cities, the most capital of which was called Hecatompylos from its hundred gates. According to some authors the Parthians were Scythians by origin. They became successively tributary to the empire of the Assyrians, Medes, and Persians, and when Alexander invaded Asia, they submitted like the other dependent provinces of Persia. Arsaces, a man of obscure origin, but of great military powers, roused at length by the oppression of Agathocles, a lieutenant of Antiochus, placed himself at the head of his countrymen, and laid the foundation of the Parthian empire, about 250 years before the Christian era. The Macedonians attempted in vain to recover it, and a race of active princes, who assumed the surnames of Arsacides from the founder, rendered it so formidable, that it even disputed the empire of the world with the Romans. It remained a kingdom till the reign of Artabanus, who was killed about the year 229 B.C. and from that time it became a province of the newly re-established kingdom of Persia, under Artaxerxes. The Parthians were naturally strong and warlike, and were esteemed the most expert horsemen and archers in the world.

PARTI, **PARTIE**, **Party**, or **Parted**, in heraldry, is applied to a shield or escutcheon, denoting it divided or marked out into partitions. *Parti per pale*, is when the shield is divided perpendicularly into two halves, by a cut in the middle from top to bottom. *Parti per fess*, is when the cut is across the middle from side to side. *Parti per bend dexter*, is when the cut comes from the upper corner of the shield on the right hand, and descends athwart to the opposite lower corner. *Parti per bend sinister*, is when the cut, coming from the upper left corner, descends across to the opposite lower one. All these partitions, according to M. de la Colombiere, have their origin from the cuts and bruises that have appeared on shields after engagements; and, being proofs of the dangers to which the bearers had been exposed, they gained them esteem: for which reason they were transmitted to

posterity, and became arms and marks of honour to their future families.

PARTIAL. *a. (partial, French.)* 1. Inclined antecedently to favour one party in a cause, or one side of the question more than the other (*Malachi*). 2. Inclined to favour without reason (*Locke*). 3. Affecting only one part; subsisting only in one part; not general (*Burnet*).

PARTIAL UMBEL, in botany; otherwise called umbellule. A smaller umbel, proceeding from the general or universal umbel. Umbellula quæ prodiit ex universalis. The involucre at the foot of this is called the partial involucre. Involucrum partiale. Pedunculus partialis, a partial peduncle, is a subdivision of a common peduncle. See **UMBEL** and **PEDUNCLE**.

PARTIALITY. *s. (partialité, Fr. from partial.)* Unequal state of the judgment and favour of one above the other (*Spenser*).

To PARTIALIZE. *v. a. (partialiser, Fr. from partial.)* To make partial (*Shakspeare*).

PARTIALLY. *ad. (from partial.)* 1. With unjust favour or dislike. 2. In part; not totally (*Rogers*).

PARTIBILITY. *s. (from partible.)* Divisibility; separability.

PARTIBLE. *a. (from part.)* Divisible; separable (*Digby*).

PARTICIPABLE. *a. (from participate.)* Such as may be shared or partaken (*Norris*).

PARTICIPANT. *a. (participant, French.)* Sharing; having share or part (*Bacon*).

To PARTICIPATE. *v. a. (participo, Latin; participer, French.)* 1. To partake; to have share (*Shakspeare*). 2. To have part of more things than one (*Denham*). 3. To have part of something common with another (*Bacon*).

To PARTICIPATE. *v. a.* To partake; to receive part of; to share (*Hooker*).

PARTICIPATION. *s. (participation, Fr. from participate.)* 1. The state of sharing something in common (*Hooker*). 2. The act or state of receiving or having part of something (*Stillingfleet*). 3. Distribution; division into shares (*Raleigh*).

PARTICIPIAL. *a. (participialis, Latin.)* Having the nature of a participle.

PARTICIPIALLY. *ad.* In the sense or manner of a participle.

PARTICIPLE. *a. (participium, Latin.)* 1. A word partaking at once the qualities of a noun and verb. (See **GRAMMAR**). 2. Any thing that participates of different things: not used (*Bacon*).

PARTICLE. *s. (particule, French; particula, Latin.)* 1. Any small proportion of a greater substance (*Newton*). 2. A word unvaried by inflection (*Hooker*).

PARTICLE, a term in theology, used in the Latin church for the crumbs or little pieces of consecrated bread called in the Greek church *μερίδες*. The Greeks have a particular ceremony, called *τρυβ μερίδων*, of the particles, wherein certain crumbs of bread, not consecrated, are offered up in honour of the Virgin,

St. John Baptist, and several other saints. They also give them the name of *προσφορά*, oblation. Gabriel archbishop of Philadelphia wrote a little treatise express *περι των μεριδων*, wherein he endeavours to shew the antiquity of this ceremony, in that it is mentioned in the liturgies of St. Chrysostom and Basil.— There has been much controversy on this head between the reformed and catholic divines.

PARTICLE, in grammar, a denomination for all those small words that tie or unite others together, or that express the modes or manners of words, usually included by grammarians under these four parts of speech, viz. adverbs, prepositions, interjections, and conjunctions.

PARTICULAR. *a.* (*particulier*, French.)

1. Relating to single persons; not general.
2. Individual; one distinct from others (*Dryden*).
3. Noting properties or things peculiar: *he had nothing particular in his conduct* (*Bacon*).
4. Attentive to things single and distinct.
5. Single; not general (*Sidney*).
6. Odd; having something that eminently distinguishes him from others.

PARTICULAR. *s.* 1. A single instance; a single point (*South*). 2. Individual; private person (*L'Estrange*). 3. Private interest (*Hooker*). 4. Private character; single self; state of an individual (*Shakspeare*). 5. A minute detail of things singly enumerated (*Ayliffe*). 6. *In particular*. Peculiarly; distinctly (*Dryden*).

PARTICULARITY. *s.* (*particularité*, Fr.) 1. Distinct notice or enumeration (*Sidney*). 2. Singleness; individuality (*Hooker*). 3. Petty account; private incident (*Addison*). 4. Something belonging to single persons (*Shakspeare*). 5. Something peculiar (*Addison*).

To PARTICULARIZE. *v. a.* (*particulariser*, French.) To mention distinctly; to detail; to show minutely (*Atterbury*).

PARTICULARLY. *ad.* (*from particular*.) 1. Distinctly; singly; not universally (*South*). 2. In an extraordinary degree (*Dryden*).

To PARTICULARIZE. *v. a.* (*from particular*.) To make mention singly; obsolete (*Camden*).

PARTIES, are those which are named in a deed or fine, as parties to it. See **FINE**.

PARTISAN. *s.* (*pertuisan*, French.) 1. A kind of pike or halberd (*Shakspeare*). 2. (*from parti*, French.) An adherent to a faction (*Addison*). 3. The commander of a party detached from the main body upon some sudden excursion. 4. A commander's leading staff (*Ainsworth*).

PARTITE LEAF. In botany, a parted leaf. Simple, but divided almost down to the base. According to the number of divisions it is called bipartite, tripartite, &c. Bipartite, or two-parted; tripartite, or three-parted, &c. It is applied in the same sense to the perianth and corol.

PARTITION. *s.* (*partition*, French; *partitio*, Latin.) 1. The act of dividing; a state of being divided (*Shakspeare*). 2. Division; separation; distinction (*Hooker*). 3. Part

divided from the rest; separate part (*Milton*). 4. That by which different parts are separated (*Bacon*). 5. Part where separation is made (*Dryden*).

PARTITION. *Dissepimentum*. In botany, a wall separating a pericarp internally into cells. This is either parallel; that is, approaching in breadth and its transverse diameter to the valves: as in lunaria and draba. Or, contrary; that is, narrower than the valves: or, as it is expressed more fully in *Delin. Pl.*—narrower, when the valves by being squeezed or contracted become concave. *Angustus ubi valvulæ coarctatæ evadunt concavæ*. This is exemplified in biscutella and thlaspi. Linnæus borrowed these terms from Tournefort; and says that they are to be understood cum grano salis. We should have conceived a parallel partition in a silique or pod to have been in the direction of the valves; a contrary or transverse one, at right angles with the valves.

To PARTITION. *v. a.* To divide into distinct parts (*Bacon*).

PARTLET. *s.* A name given to a hen; the original signification being a ruff or band, or covering for the neck (*Hall*).

PARTLY. *ad.* (*from part*.) In some measure; in some degree; in part (*Addison*).

PARTNER. *s.* (*from part*.) 1. Partaker; sharer; one who has part in any thing; associate (*Milton*). 2. One who dances with another (*Shakspeare*).

To PARTNER. *v. a.* (*from the noun*.) To join; to associate with a partner (*Shakspeare*).

PARTNERSHIP. *s.* (*from partner*.) 1. Joint interest or property (*Dryden*). 2. The union of two or more in the same trade.

PARTOOK. The preterit of *partake*.

PARTRIDGE. (See **TETRAO**.) The partridge being naturally a cowardly, fearful, simple bird, is easily deceived or beguiled with any device whatever, by train-bait, engine, call, stale, &c.

Its haunts are not certain, but various; any covert will serve its turn, and sometimes none at all.

The places partridges delight in most are corn fields, especially whilst the corn grows, for under that cover they shelter and breed; neither are those places unfrequented by them when the corn is cut, by reason of the grain they find there, and the covert or shelter of the wheat stubble. Here among the furrows, the clots, brambles, and long grass, they will hide both themselves and coveys, which are sometimes twenty or even thirty in a single covey.

When the winter season is arrived, and these stubble fields are ploughed up, or over-soiled with cattle, partridges resort into the upland meadows, and lodge in the dead grass, or fog under hedges amongst mole hills, or under the roots of trees; sometimes they resort to coppices and underwoods, especially if any corn-fields be adjacent, or where broom, brakes, fern, &c. offer an asylum.

In the harvest-time, when every field is full

P A R T R I D G E.

of men and cattle, you will find them by day in the fallow-fields adjoining the corn-fields, where they lie lurking till evening or morning, and then they feed among the sheaves of corn.

When you know their haunts, according to the situation of the country and season of the year, your next care must be to find them out in their haunts, which is done several ways. Some attempt it by the eye only; and this art can never be taught, but learned by frequent experience, distinguishing thereby the colour of the partridge from that of the earth, and how, and in what manner they lodge and couch together; by which means you may come near enough to them, they being a very lazy bird, and so unwilling to take the wing, that you may almost set your foot upon them before they will stir, provided you do not stand and gaze on them, but be in continual motion, otherwise they will spring up and fly away.

Another mode of discovering them is by going to their haunts very early in the morning, or at the close of the evening, which is called the clucking-time, and there listening for the calling of the cock-partridge, which is very loud and earnest, when after some few calls the hen will answer, and by this means they meet together, which you may know by their mutual rejoicing and chattering; upon hearing of which take your range about them, drawing nearer and nearer to the place where you heard them cluck in; casting your eye towards the furrows of the lands, and there you will soon find where the covey lies.

The best, surest, and easiest method of finding partridges is by the call, having first learned the true and natural notes of the partridge, knowing how to tune every note in its proper key, and applying them to their due times and seasons.

Being perfect herein, either mornings or evenings (all other times being improper), go to their haunts, and having secured yourself in some secret place where you may see and not be seen, listen a while if you can hear the partridges call; if you do, answer them again in the same notes, and as they change or double their notes, so must you in like manner; thus continue till they draw nearer and nearer to you: having them in your view, fall down on your back, and lie without motion, as if you were dead; by this means you may learn their whole number.

To take partridges with nets.—The nets for taking partridges must be every way like pheasant-nets, both in length and breadth, except that the meshes must be smaller; they should be made of the same thread, and dyed of the same colour.

Having found out the covey, draw forth your nets, and taking a large circumference, walk a good round pace with a careless eye, rather from than towards them, till you have trimmed your nets, and made them ready for the purpose; which done, you must draw in your circumference less and less, till you come within the length of your net, then pricking down a

stick about three feet long, fix one end of the line to the net, and make it fast in the earth as you walk about, for you must make no stop whatever: then letting the net slip out of your hands, spread it open as you go, and so carry and lay it all over the partridges.

If they should lie straggling, so that you cannot cover them all with one net, then draw forth another, and do with that as you did with the former; and so a third if there be occasion; having so done, rush in upon them suddenly, when being frightened they will fly up, and become entangled in the nets.

To take partridges with bird-lime.—Get the largest wheat-straws you can, and cut them off between knot and knot, and lime them with the strongest bird-lime. Go to the haunts of partridges and call; if you be answered, prick at some distance from you your lime-straws; in many cross-rows and ranks, cross the lands and furrows, taking in two or three lands at least, then lie close and call again, not ceasing till you have drawn them towards you, so that they be intercepted on the way by your limed straws, which they shall no sooner touch than they will be ensnared; and as they all run together like a brood of chickens, they will so besmear and daub each other, that very few will escape.

This way of taking partridges is only to be used in stubble-fields, from August till Christmas: but if you would take them in woods, pastures, or meadows, you must lime rods, the same as for pheasants, and stick them in the ground after the same manner.

To drive partridges.—This method of taking partridges is more agreeable than any other: it is conducted as follows:

Make an engine in the form of a horse, cut out of canvas, and stuff it with straw, or such like matter. With this artificial horse and your nets, go to the haunts of partridges, and having found out the covey, and pitched your nets below, proceed above, and taking the advantage of the wind, drive downward; and let your nets be pitched slope wise, and hovering. Then having your face covered with something green, or of a dark blue, and, putting the engine before you, stalk towards the partridges with a slow pace, raising them on their feet, but not their wings, and they will naturally run before you.

If they chance to run a by-way, or contrary to your purpose, then cross them with your engine, and by so facing them, they will run into that track you would have them: thus by a gentle slow pace you may make them run almost which way you will, and at last drive them effectually into your net.

To take partridges with a setting-dog.—There is no method of taking them so good as this. The setting dog is a lusty land-spaniel, taught by nature to hunt partridges more than any other animal whatever, running the fields over with such alacrity and nimbleness as if there was no limit to his fury and desire, and yet by art under such excellent command that in the very height of his career, by a hem or sound of his master's voice, he shall stand, gaze

about him, look in his master's face, and observe his directions, whether to proceed, stand still, or retire: nay, when he is even just upon his prey, that he may even take it up in his mouth, yet his obedience is so framed by art, that instantly he will either stand still or fall down flat on his belly, without daring to make any noise or motion till his master come to him, and then he will proceed in all things to follow his directions.

Having a dog thus qualified by art and nature, take him with you where partridges haunt, there cast off your dog, and by some word of encouragement that he is acquainted with engage him to range, but never too far from you; and see that he beats his ground justly and even, without casting about, or flying now here, now there, which the mettle of some will do, if not corrected and reprov'd; therefore, when you perceive this fault, you must instantly call him in with a hem, and so check him that he dare not do the like again for that day; so he will range afterwards with more temperance, frequently looking in his master's face, as if he would gather thence whether he did well or ill.

If in your dog's ranging you perceive him stop on a sudden, or stand still, you must then make up to him (for without doubt he hath set the partridge), and as soon as you come to him command him to go nearer to it; but if he go not, but either lies still or stands shaking his tail, and occasionally looks back, then cease from urging him farther, and take your circumference, walking fast, looking straight before the nose of the dog, and thereby see how the covey lies, whether close or straggling.

Then commanding the dog to lie still, draw forth your net, and prick one end to the ground, and spread your net all open, and so cover as many partridges as you can; which done, rush in with a noise and spring up the partridges, which will no sooner rise than they will be entangled in the net. And if you let go the old cock and hen, it will be a means to increase your sport.

Partridges are included in every act of parliament for the preservation of the game; and the penalty for killing a partridge by any unqualified person is five pounds: if such unqualified person kill a partridge, without having taken out an annual certificate from the clerk of the peace for the county in which he resides, (or where such partridge may have been killed,) he is then liable to a farther penalty of twenty pounds; making a forfeiture of twenty-five pounds in the whole.

If a person qualified to kill game in right of his property, (that is, by inheritance of a freehold landed estate of the clear yearly value of one hundred pounds per annum, or a leasehold of one hundred and fifty in his own, or his wife's right) do so at any one time without having taken out an annual certificate as aforesaid, and for which the sum of three guineas has been previously paid, he is then liable to a penalty of twenty pounds. And any person qualified, or unqualified, killing any partridge between the

first of February and the first of September, is liable to an additional penalty of five pounds to those already recited, for each offence.

Partridges, in their natural and infant state, accompany the hen in search of food, obey the cluck of the mother, and are protected by the clutch of her wings, in the same manner as chicken, and other domestic fowl. The hen is so instinctively attached to her young, that she will encounter every difficulty, and face death in every form, to insure their safety: although stupidly timid, and rendered almost insensible by her own fears, upon other occasions, yet great sagacity is observable in her endeavours to preserve her offspring. When they are very young, and unable to save themselves by flight; and in all cases of danger, when approached by that fatal enemy the dog; the hen will rise, and lead him on, by short flights, or rather hoverings, of twenty and thirty yards, but just above the ground, till having induced him to follow a sufficient distance from the seat of all her fears, she takes a long and more circuitous rout at her next flight; where, after finding she has completely baffled her pursuer, another effort brings her to her young in safety. When separated by danger (whether the approach of the dog and gun in the sporting season, or by other means) even to a great distance, they are invariably brought again together by the power of calling, which we have already noticed them to possess in so powerful a degree, as to insure a very expeditious recovery of each other.

PARTURIENT. *a.* (*parturiens*, Latin). About to bring forth.

PARTURITION. *s.* (from *parturio*, Lat.) The state of being about to bring forth (*Brown*).

PARTY. *s.* (*partie*, French.) 1. A number of persons confederated by similarity of designs or opinions in opposition to others; a faction (*Locke*). 2. One of two litigants (*Shakspeare*). 3. One concerned in any affair (*Shakspeare*). 4. Persons engaged against each other (*Dryden*). 5. Cause; side (*Dryden*). 6. A select assembly (*Pope*). 7. Particular person; a person distinct from, or opposed to, another (*Taylor*). 8. A detachment of soldiers.

PARTY-COLOURED. *a.* (*party and colour-ed.*) Having diversity of colours (*Dryden*).

PARTY-JURY. *s.* (In law.) A jury in some trials half foreigners and half natives.

PARTY-MAN. *s.* (*party and man.*) A factions person; an abettor of a party.

PARTY-WALL. *s.* (*party and wall.*) Wall that separates one house from the next.

By an act of 14 Geo. III. for better regulating buildings, and preventing mischiefs by fire within the cities of London and Westminster, and parishes within the bills of mortality, it is enacted in what manner buildings of all denominations shall be built; and surveyors are appointed to execute the directions of the act; the principal of which are as follows: buildings are of different rates, as, first, comprehending every church, chapel, or meet-

house; every building for distilling liquors, for making soap, melting tallow, dying, distilling turpentine, casting brass or iron, refining sugar, making glass, or chemical preparations, for sale; and all buildings, not being dwelling-houses, which exceed three clear stories above ground, or which are thirty-one feet high in either front; and dwelling-houses, exceeding the value of 850*l.* or more than nine squares on the ground plan. Second rate, warehouses whose height exceeds twenty-two feet, and is not thirty-one feet, whose value is more than 300*l.* and which are more than five squares on the ground plan. Third rate, warehouses not exceeding two clear stories, and more than one story, more than thirteen feet in height; or dwelling-houses which contain three and a half squares on the ground plan, and not

valued at more than 150*l.* Fourth rate, all warehouses under thirteen feet high, and one clear story; and all dwelling-houses under three and a half squares on the ground plan, and under the value of 150*l.* Those of the fifth rate may be of any dimensions, but must be sixteen feet from any other building, not in the same possession, &c. and four feet from any public way. Those of the sixth rate must be thirty feet from any other building not in the same possession, and eight feet from the public way: those may be made of any dimensions and materials. Those of the seventh rate are under no restraint, excepting that they must not be covered with pitch or tar, &c. The following table shews the dimensions of the party and external walls:

	first rate.		2d rate.		3d rate.		4th rate.		Bricks in length.
	Party.	External.	Party.	External.	Party.	External.	Party.	External.	
Foundation or footing	3 $\frac{1}{2}$	2 $\frac{1}{2}$	3 $\frac{1}{2}$	2 $\frac{1}{2}$	3	2 $\frac{1}{2}$	2	2 $\frac{1}{2}$	2
Basement	2 $\frac{1}{2}$	2	2 $\frac{1}{2}$	1 $\frac{1}{2}$	2	1 $\frac{1}{2}$	1 $\frac{1}{2}$	1 $\frac{1}{2}$	1 $\frac{1}{2}$
Ground floor	2	2	2	1 $\frac{1}{2}$	1 $\frac{1}{2}$	1	1	1	1
One pair floor	2	1 $\frac{1}{2}$	2	1	1	1	1	1	1
Second pair ditto	2	1 $\frac{1}{2}$	2	1	1	1	1	1	1
Third pair ditto	2	1 $\frac{1}{2}$	2	1	1	1	1	1	1
Through the roof	1 $\frac{1}{2}$	1	1 $\frac{1}{2}$	1	1	1	1	1	1

No party wall is to be cut into without giving twenty-four hours notice to the surveyor, under penalty of 20*l.* on the master, and 50*s.* on the workman for every offence.

PARVIS. *s.* (French.) A church or church porch (*Bailey*).

PARVITUDE. *s.* (from *parvus*, Latin.) Littleness; minuteness: not used (*Glanville*).

PARVITY. *s.* (from *parvus*, Lat.) Littleness; minuteness: not used (*Ray*).

PARULIS. (from *παρε*, near, and *ουλον*, the gum.) A gum-boil.

PARUS. Titmouse. In zoology, a genus of the class aves, order passerres. Bill very entire, narrow, subcompressed, strong, hard, pointed, and covered at the base with bristles; tongue truncate, bristly at the end; toes divided to the origin, the hind one long and strong. Thirty-one species, scattered over the globe, of which eight are common to our own country. It is a very fertile tribe, laying eighteen or twenty eggs at one hatch: they feed on seeds, fruits and insects, and a few on flesh; most of them are fond of the brains of other birds, which they get at by cleaving the skull of such as they find dead. They are restless, bold, and cruel to birds less than themselves, and will attack such as are three times their own size. The following are chiefly worthy of notice.

1. *P. major.* Great titmouse. Head black; temples white; nape yellow. Bill, chin, and tail, black; back and wings olive; rump blue-grey; belly greenish-yellow, divided in the middle by a bed of black extending to the vent; quill-feathers dusky, edged partly with blue, partly with white; exterior sides of the outmost tail-

feathers white, of the others blueish, inner sides dusky; legs lead-colour. Inhabits Europe, Asia, and Africa, and a native of our own country; five and three-quarters inches long; frequents gardens, but builds in woods, and lays about ten eggs; does much mischief in gardens and orchards by picking off the tender buds of trees: eggs white with rusty spots.

There is another variety, olive-brown, beneath dirty-yellowish; head black; temples cinereous; bill forked, and crossed as in the *loxia curvirostra*: it has hence been called cross-billed titmouse. A specimen was once killed near Feversham, in Kent.

2. *P. caeruleus.* Blue titmouse. Quill-feathers blueish, the primaries white on the outer edge; front white; crown blue. Bill blackish; line from the bill to the eyes and one surrounding the temples black; crown black; back yellowish-green; tail blue, the middle-feathers longer; body beneath whitish-yellow; legs and claws black. Inhabits Europe; four and a half inches long; frequents gardens, like the last, and does much injury to fruit-trees by bruising the young buds in search of insects; breeds in holes of walls, and lays from twelve to fourteen small white eggs: a native of our own country.

3. *P. palustris.* Marsh titmouse. Head black; back cinereous; temples white. There are three other varieties.

c. Wings without the white bands.

γ. Body beneath, and band on the hind-head white.

δ. Crown black; nape yellowish.

Inhabits Europe, and found in our own

country, except the second, which is a native of Louisiana. Rather larger than the last.

4. *P. laudatus*. Long-tailed titmouse. Crown white; tail-longer than the body. Greater wing-coverts black, lesser brown, edged with rosy; four middle tail-feathers black, four edged with grey, the rest varied with black and white. Inhabits Europe; found in our own country, and as far north as Siberia; five and a half inches long; is very destructive to the trees in gardens; forms an oval nest with a hole near the upper end for admission; eggs from ten to seventeen, grey tinged with reddish.

5. *P. biarmicus*. Bearded titmouse. Rufous; crown hoary; tail longer than the body; head bearded; vent black. Inhabits Europe in marshy places, and found in such in our own country; six and a quarter inches long; suspends its nest between three reeds; eggs reddish-white with small red spots.

6. *P. pendulinus*. Penduline titmouse. Head ferruginous; ocular band black; quill and tail-feathers brown, edged on each side with ferruginous. Inhabits Europe as far as Siberia; four and a half inches long; frequents moist and marshy places, and builds a nest in the shape of a long purse, with an opening on one side, and attached to the end of some branch of a tree hanging over the water.

7. *P. amatorius*. Amorous titmouse. Blackish-blue; longitudinal spot on the middle of the wings half yellow and rufous. Inhabits northern Asia; five and a half inches long: is remarkable for the great affection each sex shows towards the other.

PARUTA (Paul), a nobleman of Venice, born in 1540, distinguished himself for his learning and knowledge as a statesman. He filled several great offices and undertook many embassies, which he performed with honour and probity. There are several works of his in Italian, such as *Notes upon Tacitus*; *A history of Venice*, from 1513 to 1551. He died in 1598.

PARYPATE HYPATON. (Greek.) Next the principal. In music, the appellation applied by the ancients to the second note of their lowest tetrachord; because it followed the first, or principal. This note corresponded with our C on the second space in the bass.

PARYS, a mountain in the isle of Anglesey, famous for a copper mine, which is not wrought in the common manner of subterranean mines, but, like a stone quarry, open to day; and the quantity of ore raised is prodigious. The purest part is exported raw to the smelting works at Swansea and other places: the most impure is first calcined and deprived of most of its sulphur on the spot. Quantities of nearly pure copper are obtained from the waters lodged beneath the bed of ore, by the intervention of iron. A lead ore, rich in silver, is also found in this mountain.

PAS. s. (French.) Precedence; right of going foremost.

Pas, a town of France, in the department of the Straits of Calais, 12 miles S.W. of Arras. Lon. 2. 40 E. Lat. 50. 9 N.

PAS DE CALAIS, or STRAITS OF CALAIS, a department of France, containing the late provinces of Artois and Boulonnois. Arras is the capital.

Pas (Antoine de), marquis of Feuquieres, a mareschal-de-camp, and an excellent French officer, but he was near 40 years of age before he distinguished himself. He was so greatly disliked by his soldiers, that it was said, "he was the most courageous man alive, since he slept every night in the midst of a hundred thousand enemies."

PASCAL (Blaise), a very eminent French mathematician and philosopher, and one of the greatest geniuses and best writers that country has produced. He was born at Clermont in Auvergne, in the year 1623. His father, Stephen Pascal, was president of the court of aids in his province: he was also a very learned man, an able mathematician, and a friend of Des Cartes. Having an extraordinary tenderness for this child, his only son, he quitted his province, and settled at Paris in 1631, that he might be quite at leisure to attend to his son's education, which he conducted himself, and young Pascal never had any other master. From his infancy Blaise gave proofs of a very extraordinary capacity. He was extremely inquisitive, desiring to know the reason of every thing; and when good reasons were not given him, he would seek for better; nor would he ever yield his assent but upon such as appeared to him well grounded. What is told of his manner of learning the mathematics, as well as the progress he quickly made in that science, seems almost miraculous. His father, perceiving in him an extraordinary inclination to reasoning, was afraid lest the knowledge of the mathematics might hinder his learning the languages, so necessary as a foundation to all sound learning. He therefore kept him as much as he could from all notions of geometry, locked up all his books of that kind, and refrained even from speaking of it in his presence. He could not however prevent his son from musing on that science; and one day in particular he surprised him at work with charcoal upon his chamber floor, and in the midst of figures. The father asked him what he was doing: I am searching, says Pascal, for such a thing; which was just the same as the 32d proposition of the 1st book of Euclid. He asked him then how he came to think of this: it was, said Blaise, because I found out such another thing; and so, going backward, and using the names of bar and round, he came at length to the definitions and axioms he had formed to himself. From this time he had full liberty to indulge his genius in mathematical pursuits. He understood Euclid's Elements as soon as he cast his eyes upon them. At sixteen years of age he wrote a treatise on Conic Sections, which was accounted a great effort of genius; and therefore it is no wonder that Des Cartes, who had been in Holland a long time, upon reading it, should choose to believe that M. Pascal the father was the real author of it. At nineteen he contrived an ad-

mirable arithmetical machine, which would have done credit as an invention to any man versed in science. About this time his health became impaired, so that he was obliged to suspend his labours for the space of four years. After this, having seen Torricelli's experiment respecting a vacuum and the weight of the air, he turned his thoughts towards these objects, and undertook several new experiments, by which he was fully convinced of the general pressure of the atmosphere; and from this discovery he drew many useful and important inferences. He composed also a large treatise, in which he fully explained this subject, and replied to all the objections that had been started against it. As he afterwards thought this work rather too prolix, and being fond of brevity and precision, he divided it into two small treatises, one of which he entitled, *A Dissertation on the Equilibrium of Fluids*: and the other, *An Essay on the Weight of the Atmosphere*. These labours procured Pascal also much reputation, that the greatest mathematicians and philosophers of the age proposed various questions to him, and consulted him respecting such difficulties as they could not resolve. Upon one of these occasions he discovered the solution of a problem proposed by Mersenne, which had baffled the penetration of all that had attempted it. This problem was to determine the curve described in the air by the nail of a coach-wheel, while the machine is in motion; which curve was thence called a *roulette*, but now commonly known by the name of *cycloid*. Pascal offered a reward of forty pistoles to any one who should give a satisfactory answer to it. No person having succeeded, he published his own at Paris; but under the name of A. d'Ettonville. This was the last work which he published in the mathematics; his infirmities, from a delicate constitution, though still young, now increasing so much, that he was under the necessity of renouncing severe study, and of living so recluse, that he scarcely admitted any person to see him.

After having thus laboured abundantly in mathematical and philosophical disquisitions, he forsook those studies and all human learning at once, to devote himself to acts of devotion and penance. He was not 24 years of age, when the reading some pious books had put him upon taking this resolution; and he became as great a devotee as any age has produced. He now gave himself up entirely to a state of prayer and mortification; and he had always in his thoughts these great maxims of renouncing all pleasure and all superfluity; and this he practised with rigour even in his illnesses, to which he was frequently subject, being of a very invalid habit of body.

Though Pascal had thus abstracted himself from the world, yet he could not forbear paying some attention to what was doing in it; and he even interested himself in the contest between the Jesuits and the Jansenists. Taking the side of the latter, he wrote his *Lettres Provinciales*, published in 1656, under the name of Louis de Montalte, making the for-

mer the subject of ridicule. "These letters," says Voltaire, "may be considered as a model of eloquence and humour. The best comedies of Moliere have not more wit than the first part of these letters; and the sublimity of the latter part of them is equal to any thing in Bossuet. It is true indeed that the whole book was built upon a false foundation; for the extravagant notions of a few Spanish and Flemish Jesuits were artfully ascribed to the whole society. Many absurdities might likewise have been discovered among the Dominican and Franciscan casuists; but this would not have answered the purpose; for the whole rallery was to be levelled only at the Jesuits. These letters were intended to prove, that the Jesuits had formed a design to corrupt mankind; a design which no sect or society ever had, or can have." Voltaire calls Pascal the first of their satirists; for Despréaux, says he, must be considered as only the second. In another place, speaking of this work of Pascal, he says, that "Examples of all the various species of eloquence are to be found in it. Though it has now been written almost 100 years, yet not a single word occurs in it, savouring of that vicissitude to which living languages are so subject. Here then we are to fix the epoch when our language may be said to have assumed a settled form. The bishop of Lucon, son of the celebrated Bossu, told me, that asking one day the bishop of Meaux what work he would covet most to be the author of, supposing his own performances set aside, Bossu replied, *The Provincial Letters*." These letters have been translated into all languages, and printed over and over again. Some have said that there were decrees of formal condemnation against them; and also that Pascal himself, in his last illness, detested them, and repented of having been a Jansenist: but both these particulars are false and without foundation. It was supposed that father Daniel was the anonymous author of a piece against them, entitled *The Dialogues of Cleander and Eudoxus*.

Pascal was but about 30 years of age when these letters were published; yet he was extremely infirm, and his disorders increasing soon after so much that he conceived his end fast approaching, he gave up all farther thoughts of literary composition. He resolved to spend the remainder of his days in retirement and pious meditation; and with this view he broke off all his former connections, changed his habitation, and spoke to no one, not even to his own servants, and hardly ever even admitted them into his room. He made his own bed, fetched his dinner from the kitchen, and carried back the plates and dishes in the evening; so that he employed his servants only to cook for him, to go to town, and to do such other things as he could not absolutely do himself. In his chamber nothing was to be seen but two or three chairs, a table, a bed, and a few books. It had no kind of ornament whatever; he had neither a carpet on the floor, nor curtains to his bed. But this did not prevent him from sometimes receiving visits; and when his

friends appeared surprised to see him thus without furniture, he replied, that he had what was necessary, and that any thing else would be a superfluity, unworthy of a wise man. He employed his time in prayer, and in reading the Scriptures; treasuring up such thoughts as this exercise inspired. Though his continual infirmities obliged him to use very delicate food, and though his servants employed the utmost care to provide only what was excellent, he never relished what he ate, and seemed quite indifferent whether they brought him good or bad. His indifference in this respect was so great, that though his taste was not vitiated, he forbade any sauce or ragout to be made for him which might excite his appetite.

Though Pascal had now given up intense study, and though he lived in the most temperate manner, his health continued to decline rapidly; and his disorders had so enfeebled his organs, that his reason became in some measure affected. He always imagined that he saw a deep abyss on one side of him, and he never would sit down till a chair was placed there, to secure him from the danger which he apprehended. At another time he fancied that he had a kind of vision or ecstasy; a memorandum of which he preserved during the remainder of his life on a bit of paper, put between the cloth and the lining of his coat, and which he always carried about him. After languishing for several years in this imbecile state of body and mind, M. Pascal died at Paris the 19th of August 1662, at 39 years of age.

In company, Pascal was distinguished by the amiableness of his behaviour; by great modesty; and by his easy, agreeable, and instructive conversation. He possessed a natural kind of eloquence, which was in a manner irresistible. The arguments he employed for the most part produced the effect which he proposed; and though his abilities intitled him to assume an air of superiority, he never displayed that haughty and imperious tone which may often be observed in men of shining talents. The philosophy of this extraordinary man consisted in renouncing all pleasure, and every superfluity. He not only denied himself the most common gratifications; but he took also without reluctance, and even with pleasure, either as nourishment or as medicine, whatever was disagreeable to the senses; and he every day retrenched some part of his dress, food, or other things, which he considered as not absolutely necessary. Towards the close of his life, he employed himself wholly in devout and moral reflections, writing down those which he deemed worthy of being preserved. The first bit of paper he could find was employed for this purpose; and he commonly set down only a few words of each sentence, as he wrote them merely for his own use. The scraps of paper upon which he had written these thoughts were found after his death filed upon different pieces of string, without any

order or connection; and being copied exactly as they were written, they were afterward arranged and published, under the title of *Pensées*, &c. or *Thoughts upon Religion and other Subjects*; being parts of a work he had intended against atheists and infidels, which has been much admired. After his death appeared also two other little tracts; the one intitled, *The Equilibrium of Fluids*; and the other *The Weight of the Mass of Air*.

The works of Pascal were collected in 5 volumes 8vo, and published at the Hague, and at Paris, in 1779. This edition of Pascal's works may be considered as the first published; at least the greater part of them were not before collected into one body, and some of them had remained only in manuscript. For this collection the public were indebted to the Abbé Bossu, and Pascal was deserving of such an editor. "This extraordinary man," says he, "inherited from nature all the powers of genius. He was a mathematician of the first rank, a profound reasoner, and a sublime and elegant writer. If we reflect, that in a very short life, oppressed by continual infirmities, he invented a curious arithmetical machine, the elements of the calculation of chances, and a method of resolving various problems, respecting the cycloid; that he fixed in an irrevocable manner the wavering opinions of the learned concerning the weight of the air; that he wrote one of the completest works existing in the French language; and that in his *Thoughts* there are passages the depth and beauty of which are incomparable—we can hardly believe that a greater genius ever existed in any age or nation. All those who had occasion to frequent his company in the ordinary commerce of the world acknowledged his superiority; but it excited no envy against him, as he was never fond of showing it. His conversation instructed, without making those who heard him sensible of their own inferiority; and he was remarkably indulgent towards the faults of others. It may be easily seen by his *Provincial Letters*, and by some of his other works, that he was born with a great fund of humour, which his infirmities could never entirely destroy. In company, he readily indulged in that harmless and delicate raillery which never gives offence, and which greatly tends to enliven conversation; but its principal object generally was of a moral nature. For example, ridiculing those authors who say, *my book, my commentary, my history*, they would do better (added he) to say, *our book, our commentary, our history*; since there are in them much more of other people's than their own."

The celebrated Bayle, speaking of this great man, says, an hundred volumes of sermons are not of so much avail as a simple account of the life of Pascal. His humility and his devotion mortified the libertines more than if they had been attacked by a dozen of missionaries. In a word, Bayle had so high an idea of this philosopher, that he calls him a paradox in the human species. "When we consider his cha-

racter (says he), we are almost inclined to doubt that he was born of a woman, like the man mentioned by Lucretius: *ut vir humana videatur stirpe creatus.*"

Voltaire, who thought it impossible he could do too much towards limiting the influence of christianity in the world, could not suffer so extraordinary and popular a book as Pascal's Thoughts to be circulated always in their original state. He therefore undertook to corrupt them in a way that exhibits one of the most singular specimens of literary artifice that has ever been imposed upon the world. This artifice consisted in publishing an edition of the Thoughts, with notes by Voltaire himself. In this edition he differently arranged, or rather disarranged the Thoughts themselves, so as to destroy much of their beauty and force. Some new passages were inserted, taken from manuscripts of Pascal to which he had access; and in the introduction of which he has taken care to blend some abominable things of his own invention, for the purpose of making Pascal appear as unprincipled a hy as himself; added to this, he also introduced into the body of the work, and under the running title of Pascal's Thoughts, a discourse intended to bring the immortality of the soul into question! The phraseology of Pascal, too, he has often changed; and various notes are added here and there, in order to make some passages appear laughable, others weak, and others absurd. If infidelity can make a man of genius stoop to such dirty work as this, what honest man must not shudder at the idea of becoming an infidel?

PASCALIA. In botany, a genus of the class syngenesia, order polygamia superflua. Receptacle naked; seeds drupaceous, crowned with a toothed margin; calyx imbricate. One species, a native of Chili, with nearly simple erect stem; toothed, ovate, glabrous leaves; solitary, terminal, yellow flowers.

PASCHAL. *a.* (*pascal*, Fr. *paschalis*, Lat.) 1. Relating to the passover. 2. Relating to Easter.

PASEWALK, a town of Upper Saxony, in Interior Pomerania. Near it are some iron-works. It is situate on the Ucker, 21 miles W. of Stettin, and 66 S.S.E. of Stralsund. Lon. 13. 57 E. Lat. 53. 27 N.

PASH. *s.* (*paz*, Spanish.) A face (*Shakspeare*).

To PASH. *v. a.* (*perssen*, Dutch.) To strike; to crush (*Dryden*).

PASPALUM. In botany, a genus of the class triandria, order digynia. Calyx two-valved, orbicular; corol the size of the calyx; stigmas pencil-form. Fifteen species, natives of both the Indies and of America.

PASQUIN, a mutilated statue, seen at Rome, in a corner of the palace of the Ursini. It takes its name from a cobbler of that city, called Pasquin, famous for his sneers and gibes, and whose shop was the resort of a number of idle people, who diverted themselves with bantering folks as they passed by.

After Pasquin's death, as they were digging up the pavement before his shop, they found a statue of an ancient gladiator, well cut, but maimed, and half spoiled. This they set up, in the place where it was found, at the corner of the deceased Pasquin's shop; and, by common consent, called it by the name of the defunct.

From that time all satires and lampoons are ascribed to this figure, and are put in its mouth or pasted against it; as if they came from Pasquin *redivivus*. Pasquin usually addresses himself to Marforio, another statue in Rome; or Marforio to Pasquin, whom they then make reply.

The answers are usually very short, poignant, and unlucky. When Marforio is attacked, Pasquin comes to his assistance; and Pasquin is assisted by Marforio in his turn; i. e. the people make the statues speak just what they please.

PASQUINADE, or **PASQUIL**, is properly a satirical libel fastened to the statue of Pasquin.

Hence, by extension, the term becomes used for any satire, lampoon, or sneer upon the public, or upon the ruling powers.

To PASS. *v. n.* (*passer*, French.) 1. To go; to move from one place to another; to be progressive (*Shakspeare*). 2. To go forcibly; to make way (*Dryden*). 3. To make a change from one thing to another (*Temple*). 4. To vanish; to be lost (*Dryden*). 5. To go away progressively (*Locke*). 6. To be at an end; to be over (*Dryden*). 7. To die; to pass from the present life to another state (*Shakspeare*). 8. To be changed by regular gradation (*Arbutnot*). 9. To go beyond bounds; obsolete (*Shakspeare*). 10. To be in any state (*Ezekiel*). 11. To be enacted (*Clarendon*). 12. To be effected; to exist (*Hooker*). 13. To gain reception; to become current (*L'Estrange*). 14. To be practised artfully or successfully (*Shaks.*). 15. To be regarded as good or ill (*Atterbury*). 16. To occur; to be transacted (*Watts*). 17. To be done (*Taylor*). 18. To heed; to regard; not in use (*Shakspeare*). 19. To determine finally; to judge capitally (*Shakspeare*). 20. To be supremely excellent (*Underwood*). 21. To thrust; to make a push in fencing (*Dryden*). 22. To omit to play (*Prior*). 23. To go through the alimentary duct (*Arbutnot*). 24. To be in a tolerable state (*L'Estrange*). 25. To Pass away. To be lost; to glide off (*Locke*). 26. To Pass away. To vanish.

To PASS. *v. a.* 1. To go beyond (*Hay*). 2. To go through: as, *the horse passed the river*. 3. To spend; to live through (*Collier*). 4. To impart to any thing the power of moving (*Derham*). 5. To carry hastily (*Addison*). 6. To transfer to another proprietor (*Herb.*). 7. To strain; to percolate (*Bacon*). 8. To vent; to pronounce (*Watts*). 9. To utter ceremoniously (*Clarendon*). 10. To utter solemnly (*L'Estrange*). 11. To transmit; to procure to go (*Clarendon*). 12. To put an end to (*Sh.*). 13. To surpass; to excel (*Ezekiel*). 14. To

omit; to neglect (*Shakspeare*). 15. To transcend; to transgress (*Burnet*). 16. To admit; to allow (*Kings*). 17. To enact a law (*Swift*). 18. To impose fraudulently (*Dryden*). 19. To practise artfully; to make succeed (*L'Estrange*). 20. To send from one place to another: as, pass that beggar to his own parish. 21. To Pass away. To spend; to waste (*Ecclus.*). 22. To Pass by. To excuse; to forgive (*Til.*). 23. To Pass by. To neglect; to disregard (*Bacon*). 24. To Pass over. To omit; to let go unregarded (*Dryden*).

PASS. *s.* (from the verb.) 1. A narrow entrance; an avenue (*Shakspeare*). 2. Passage; road (*Ruleigh*). 3. A permission to go or come any where (*Shakspeare*). 4. An order by which vagrants or impotent persons are sent to their place of abode. 5. Push; thrust in fencing (*Sh.*). 6. State; condition (*Sidney*).

PASS, in a military sense, a strait and difficult passage, which shuts up the entrance into a country.

PASS; or PASSADE, in fencing, an advance or leap forward upon the enemy. Of these there are several kinds; as passes within, above, beneath, to the right, the left, and passes under the line, &c. The measure of the pass is when the swords are so near as that they may touch one another.

PASSABLE. *a.* (*passable*, Fr. from *pass*.) 1. Possible to be passed or travelled through or over (*Shakspeare*). 2. Supportable; tolerable; allowable (*Dryden*). 3. Capable of admission or reception (*Collier*). 4. Popular; well received (*Bacon*).

PASSACAGLIO. (*Ital.*) In music, a kind of chacone, but somewhat graver and more delicate than that air. See PASSACAILLE.

PASSACAILLE. (*French.*) A kind of chacone of a tender and slow movement. It is generally written in three crotchets, and begins with the third. There are, however, passacailles in common time beginning with the full bar, though they are very rare.

PASSADE, in fencing. See PASS.

PASSADE, in the manage, is a tread, or way, that a horse makes oftener than once upon the same extent of ground, passing and repassing from one end of its length to the other, which cannot be done without changing the hand, or turning and making a demi-tour at each of the extremities of the ground. Hence it comes that there are several sorts of passades, according to the different ways of turning, in order to part, or put on again and return upon the same piste or tread, which is called closing the passade.

PASSAGE, in the manage. To passage a horse, is to make him go upon a walk or trot upon two pistes or treads, between the two heels, and side-ways, so that his hips make a tract parallel to that made by his shoulders. It is but of late that passing upon a trot has been used, for formerly the word passage signified walking a horse upon two treads behind the two heels.

A horse is passaged upon two straight lines, along a wall or hedge: he is likewise passaged

on his own length upon volts, in going side-ways upon a circle, round a center, the semi-diameter being above his own length, so that he looks into the volt, and half his shoulders go before the croup. In all passing, the horse's outward fore-leg must cross or lap a great deal over the inward fore-leg, at every second time of marking. In a passage on a walk, and that on a trot, the motion of the horse is the same, only one is swifter than the other.

PASSAGE. *s.* (*passage*, French.) 1. Act of passing; travel; course; journey (*Raleigh*). 2. Road; way (*South*). 3. Entrance or exit; liberty to pass (*Shakspeare*). 4. The state of decay: not in use (*Shakspeare*). 5. Intellectual admittance; mental acceptance (*Digby*). 6. Occurrence; hap (*Shakspeare*). 7. Unsettled state; aptness by condition or nature to change the place of abode (*Temple*). 8. Incident; transaction (*Hayward*). 9. Management; conduct (*Davies*). 10. Part of a book; single place in a writing. *Endroit*, French (*Addison*).

PASSAGE. In stat. 4 Edward III. c. 7, this term is used for the hire a man pays for being transported over any sea or river. Various statutes of a local nature have been passed for regulating the passage of particular rivers. By a statute of Edward IV. the passage from Kent to Calais is restrained to Dover.

PASSAGE (Birds of), are such as only come to us at certain seasons, and then disappear again; being supposed to pass the sea to some other climate.

Among the birds of passage are the stork, swallow, nightingale, martin, woodcock, quail, hooded crow, cuckoo, wry-neck, several species of the pigeon and thrush, snipe, curlew, several species of sand-piper, long-legged plover, land-rail, several species of grebe, divers, terns, mergansers, many species of ducks, &c.

Mr. Pennant remarks, that every species of the genera of curlews, woodcocks, sand-pipers, and plovers, that forsake us in the spring, retire to Sweden, Poland, Prussia, Norway, and Lapland, to breed; and as soon as the young can fly, they return to us again; because the frosts which set in early in those countries deprive them of the means of subsistence; and the dryness and hardness of the ground, in general, during our summer, prevent them from penetrating the earth with their bills in search of worms, which are the natural food of these birds. Of the numerous species of migrating fowl, there are scarcely any that may not be traced to Lapland, a country of lakes, rivers, swamps, and alps, covered with thick and gloomy forests, that afford shelter during summer to these fowls, which in winter disperse over the greatest part of Europe. In those northern regions, by reason of the thickness of the woods, the ground remains moist and penetrable by the woodcocks, and other slender-billed fowl; and for the web-footed birds, the waters afford larvæ without number of the gnat. The days are long, and the light nights are favourable to their collecting this food: to which we may add, that mankind are

very sparingly scattered over that vast northern waste. *British Zoology*, vol. ii. Appendix. See MIGRATION, ORNITHOLOGY.

PASSALUS, in entomology, a tribe in the Fabrician system, belonging to the coleopterous genus *DERMESTES*, which see.

PASSANT, in heraldry, a term applied to a lion or other animal in a shield, appearing to walk leisurely: for most beasts, except lions, the trippant is frequently used instead of passant.

PASSAROWITZ, a town of Turkey in Europe, in Servia, remarkable for a peace concluded there, in 1718, between the emperor Charles VI. and Achmet III. It is situate near the river Morava, 33 miles E.S.E. of Belgrade, and 44 W. of Orsova. Lon. 21. 16 E. Lat. 45. 6 N.

PASSARVAN, a town of the island of Java, in the East Indies. Lon. 114. 15 E. Lat. 7. 0 S.

PASSAU, an ancient city of Bavaria, capital of a bishopric of the same name, with a fort. The houses are well built, and the cathedral is thought to be the finest in all Germany. It is divided into four parts, namely, the town of Passau Instadt, Illstadt, and the quarter in which is the bishop's palace. The first three are fortified, but the last is only a suburb. It is seated at the confluence of the Inn and Iltz, 62 miles E. by S. of Ratisbon, and 135 W. of Vienna. Lon. 13. 37 E. Lat. 48. 28 N.

PASSÉD. The pret. and part. of *pass*.

PASSENGER. *s.* (*passager*, French.) 1. A traveller; one who is upon the road; a wayfarer (*Spenser*). 2. One who hires in any vehicle the liberty of travelling (*Sidney*).

PASSENGER FALCON. *s.* A kind of migratory hawk (*Ainsworth*).

PASSER. *s.* (from *pass*.) One who passes; one that is upon the road (*Carew*).

PASSERES. In zoology, the name of the sixth order of the Linnéan class aves: thus ordinarily characterised. Bill conic, pointed; legs formed for hopping; toes slender; divided; body slender; flesh of such as feed on grain pure, of such as feed on insects impure; nest formed with wonderful art. They live chiefly in trees and hedges, are monogamous, vocal, and feed their young by thrusting the food down their throats. The order includes seventeen genera, for which see the article ZOOLOGY.

PASSERINA. In botany, a genus of the class octandria, order monogynia. Calyxless; corol four-cleft; stamens seated on the tube; nut one, covered with a bark. Sixteen species; chiefly natives of the Cape: a few of the south of Europe.

PASSERO (Cape), anciently called Pachinus, the most southerly point of Sicily. It is a barren island, about a mile round, separated from the rest of Sicily by a strait, half a mile broad. It has a fort, to protect the country from the incursions of the Barbary corsairs. Lon. 15. 22 E. Lat. 36. 35 N.

PASSIBILITY. *s.* (*passibilité*, Fr. from *passible*.) Quality of receiving impressions from external agents (*Hakewill*).

PASSIBLE. *a.* (*passible*, Fr. *passibilis*, Lat.) Susceptible of impressions from external agents (*Hooker*).

PASSIBLENESS. *s.* Quality of receiving impressions from external agents (*Brerewood*).

PASSIFLORA. Passion-flower. Love in a mist. In botany, a genus of the class monadelphia, order pentandria. Calyx five-parted; petals five, inserted into the calyx; nectary a crown of filaments surrounding the stamens and styles; styles three; gourd pedicelled. Forty-six species, all natives of the West Indies or South America. They may be thus divided into tribes.

A. Leaves undivided.

B. Leaves two-lobed.

C. Leaves three-lobed.

D. Leaves many-cleft.

The following are cultivated.

1. *P. cærulea*. Common or blue passion-flower.

2. *P. incarnata*. Rose-coloured passion-flower.

3. *P. lutea*. Yellow passion-flower.

4. *P. serratifolia*. Notch-leaved passion-flower.

5. *P. maliformis*. Apple-fruited passion-flower.

6. *P. quadrangularis*. Square-stalked passion-flower.

7. *P. alata*. Wing-stalked passion-flower.

8. *P. laurifolia*. Bay-leaved passion-flower, or water melon.

9. *P. multiflora*. Many-flowered passion-flower.

10. *P. rubra*. Red-fruited passion-flower.

11. *P. muracinja*. Moon-shaped passion-flower.

12. *P. vespertilis*. Bat-winged passion-flower.

13. *P. rotundifolia*. Round-leaved passion-flower.

14. *P. ciliata*. Ciliated passion-flower.

15. *P. suberosa*. Cork-barked passion-flower.

16. *P. nolosericica*. Silky-leaved passion-flower.

17. *P. glauca*. Glauous-leaved passion-flower.

18. *P. minima*. Dwarf passion-flower.

As all the species are natives of warm climates, there are few of them, except *P. cærulea*, that will succeed in the open air in our own country; and even this requires a warm situation, and often loses its branches in severe winter.

The fruit of the *P. maliformis* is esteemed a delicacy in the West Indies, where it is served up among the deserts of the islands. The fruit of *P. laurifolia* has a delicious smell and flavour, and is excellent in quenching thirst, abating heat of the stomach, increasing the appetite, recruiting the spirits, and allaying heat in burning fevers.

PASSING. *participial a.* (from *pass*.) 1. Supreme; surpassing others; eminent (*Fairfax*). 2. It is used adverbially to enforce the meaning of another word. Exceeding; as, *passing fair* (*Shakspeare*).

PA'SSINGBELL. *s.* (*passing* and *bell*.) The bell which rings at the hour of departure, to attend prayers for the passing soul: it is often used for the bell which rings immediately after death (*Daniel. Swift*).

PASSING-NOTES, those notes in the melody, bass, or other parts of a composition, which do not represent the sounds of the chord or harmony, but which are only introduced for the purpose of ornamenting and enriching the effect.

PASSING-SHAKE, a short trill, made *en passant*, in flowing passages of quavers or semi-quavers, without breaking the time, or interrupting the natural course of the melody.

These, and indeed most other adventitious graces, must be introduced with great caution and discretion, as well as with much delicacy and propriety of execution.

PASSION. *s.* (*passion*, Fr. *passio*, Latin.)

1. Any effect caused by external agency (*Loc.*).
2. Susceptibility of effect from external action (*Bacon*).
3. Violent commotion of the mind (*Milton*).
4. Anger (*Watts*).
5. Zeal; ardour (*Addison*).
6. Love (*Dryden*).
7. Eagerness (*Swift*).
8. Emphatically. The last suffering of the Redeemer of the world (*Acts*).

To **PA'SSION**, *v. n.* (*passionner*, French.) To be extremely agitated; to express great commotion of mind: obsolete (*Shakspeare*).

PASSION (*passio*, *πάθος*, or *πάθημα*) is applied to the different motions and agitations of the soul, according to the different objects that present themselves to the senses. In propriety all those motions whereby the soul is carried towards anything; as love, ambition, revenge, &c. are rather actions than passions.

Those motions whereby the soul finds itself interrupted in its actions, as grief, &c. are the only real passions.

We find various modifications and impressions of pleasure and pain inseparably annexed, by an established law of nature, to the several judgments we form concerning good and evil; these judgments, with their respective modifications of pleasure or pain annexed, according to the various appearances and relations of the object considered, either as good or evil, present or absent, certain or uncertain, probable or improbable, possible or impossible, and affecting the machine in a certain manner peculiar to such modifications, make what we call the passions.

How, or by what means, this mutual action and communication between soul and body is effected, we are in a great measure ignorant; we have but very obscure and faint notions of any thing prior, or more simple to resolve it into, except the immediate will and agency of the first cause itself.

Malebranche defines the passions to be all those emotions naturally arising in the soul, on occasion of extraordinary motions of the animal spirits, and the blood. In opposition to those motions of the soul which are common to us with pure intelligences, and which he calls natural inclinations.

Though the passions be inseparable from inclinations; and though a man be only capable of sensible love or hatred, because he is capable of spiritual ones; yet does it appear just in that author to distinguish between them. Passions are much stronger and warmer than inclinations; their objects also are different, and so are their causes: in

truth, passions and inclinations differ just as much as sense and imagination.

An ingenious writer has accurately distinguished between our affections and our passions; the former, which we apply indiscriminately to all reasonable beings, may most properly signify the desires and inclinations, founded in the reasonable nature itself, and essential to it; such as self-love, benevolence, and the love of truth. These, when aided and strengthened by additional instinctive determinations, are, properly, passions. Those tendencies within us that are merely arbitrary and instinctive, such as hunger and thirst, and the desires between the sexes, we commonly call appetites or passions, indifferently, but seldom or never affections. *Price's Rev. of Morals*, p. 125, &c.

Passion, says another excellent writer, is a kind of medium between a simple affection of the mind and the appetites and sensations of the body. Passion is an affection of the mind which distinguishes it from the appetites of the body, hunger and thirst, and from bodily sensations; and it is attended with a peculiar and extraordinary emotion of the animal spirits, by which it is distinguished from pure affection, and from the several sensations; in all which, though there be some motion of the blood and spirits, yet that motion is natural and regular; whereas in the agitation occasioned by the passions, the spirits are moved after a more vehement and tumultuous manner. *Grove's System of Moral Philosophy*, vol. i. chap. 7.

But Dr. Cogan, a recent very able writer on this interesting branch of enquiry, in giving a general view of the subject, says, by passions, emotions, and affections, we understand those stronger or weaker feelings, with their correspondent effects upon the system, which are excited within us by the perception or contemplation of certain qualities, which belong, or are supposed to belong to the objects of our attention; and which in some respect or other appear interesting to us. In all cases, when the violence of the emotion is not too powerful for the animal œconomy, the feelings or sensations excited are pleasant or unpleasant, according to the nature of the exciting cause, the ideas entertained of it, or the intenseness with which the mind is struck by it. These feelings differ in degrees of strength, according to the apparent importance of their cause; according to certain peculiarities of temperament; and also according to the manner in which the influential qualities are presented to the mind.

One or other of the three terms, passion, emotion, affection, is always employed to express the sensible effects which objects, or ideas concerning them, have upon the mind; but they are so frequently employed in a vague and indeterminate manner, that some difficulty attends the attempt to restore them to their precise and discriminating significations.

The word passion is thus rendered subject to several peculiarities in the application of it. Sometimes it is used in a generic sense, as expressive of every impression made upon the mind. When we speak of the passions in general, or of a treatise on the passions, we mean not to express the stronger impressions alone; the mildest affections are also included: and if we denominate any one to be a person of strong passions, we mean that he is subject to violent transports of joy, or grief, or anger, &c. indiscriminately. In one instance the word is emphatically employed to express suffering; as our Saviour's passion: in another it indicates anger exclusively; thus when it is said of any one that he

PASSION.

is in a passion, it is universally understood that he is very angry. The term passion, and its adverb passionately, often express a very strong predilection for any pursuit, or object of taste; a kind of enthusiastic fondness for any thing. Thus we remark of one person that he has a passion for music, or that he is passionately fond of music; of another that he is passionately fond of painting, &c.

In a sense similar to this is the word also applied to every propensity which operates strongly and permanently upon the mind; as the selfish passions, the generous passions. Yet when we mean to particularize any of these, a different law of phraseology is observed. The word passion is appropriated by the evil propensities which are uniformly operative. Thus we do not say the affection of pride, or of avarice, but the passion. The term affection on the other hand is appropriated by the virtuous propensities; as the social, friendly, parental, filial, affections, &c. though philosophically considered, the relation they bear to the state and workings of the mind is perfectly analogous.

Nor is this capricious latitude of expression confined to common language, where accuracy is not always to be expected. It is also obvious among philosophers themselves; so that scarcely two authors who have written upon the subject of the passions are agreed in their ideas of the terms they employ. Hence it will not be expected that we should dwell long upon them, in this place; we shall, therefore, refer to the individual articles FEAR, GRIEF, JOY, LOVE, &c. in this work, and for more complete information to Dr. Cogan's very ingenious treatise already quoted.

With regard to the external signs of the passions, we may remark with Lord Kames, that manifold and admirable are the purposes to which they are made subservient by the Author of our nature.

1. The signs of internal agitation displayed externally to every spectator, tend to fix the signification of many words.

2. Society among individuals is greatly promoted by that universal language. Looks and gestures give direct access to the heart; and lead us to select, with tolerable accuracy, the persons who are worthy of our confidence. It is surprising how quickly, and for the most part how correctly, we judge of character from external appearance.

3. After social intercourse is commenced, these external signs, which diffuse through a whole assembly the feelings of each individual, contribute above all other means to improve the social affections. Language, no doubt, is the most comprehensive vehicle for communicating emotions: but in expedition, as well as in power of conviction, it falls short of the signs under consideration; the involuntary signs especially, which are incapable of deceit. Where the countenance, the tones, the gestures, the actions, join with the words in communicating emotions, these united have a force irresistible. Thus all the pleasant emotions of the human heart, with all the social and virtuous affections, are, by means of these external signs, not only perceived but felt. By this admirable contrivance, conversation becomes that lively and animating amusement, without which life would at best be insipid: one joyful countenance spreads cheerfulness instantaneously through a multitude of spectators.

4. Dissocial passions, being hurtful by prompting violence and mischief, are noted by the most conspicuous external signs, in order to put us upon our guard: thus anger and revenge, especially when sudden, display themselves on the countenance in

legible characters. The external signs, again, of every passion that threatens danger raise in us the passion of fear; which frequently operating without reason or reflection, moves us by a sudden impulse to avoid the impending danger.

5. These external signs are remarkably subservient to morality. A painful passion, being accompanied with disagreeable external signs, must produce in every spectator a painful emotion: but then, if the passion be social, the emotion it produces is attractive, and connects the spectator with the person who suffers. Dissocial passions only are productive of repulsive emotions, involving the spectator's aversion, and frequently his indignation. This artful contrivance makes us cling to the virtuous, and abhor the wicked.

6. Of all the external signs of passion, those of affliction or distress are the most illustrious with respect to a final cause, and deservedly merit a place of distinction. They are illustrious by the singularity of their contrivance; and also by inspiring sympathy, a passion to which human society is indebted for its greatest blessing, that of providing relief for the distressed. A subject so interesting deserves a leisurely and attentive examination. The conformity of the nature of man to his external circumstances is in every particular wonderful; his nature makes him prone to society; and society is necessary to his well-being, because in a solitary state he is a helpless being, destitute of support, and in his distresses destitute of relief: but mental support, the shining attribute of society, is of too great moment to be left dependent upon cool reason; it is ordered more wisely, and with greater conformity to the analogy of nature, that it should be enforced even instinctively by the passion of sympathy. Here sympathy makes a capital figure, and contributes more than any other means to make life easy and comfortable. But however essential the sympathy of others may be to our well-being, one beforehand would not readily conceive how it could be raised by external signs of distress: for, considering the analogy of nature, if these signs be agreeable, they must give birth to a pleasant emotion leading every beholder to be pleased with human woes: if disagreeable, as they undoubtedly are, ought they not naturally to repel the spectator from them, in order to be relieved from pain? Such would be the reasoning beforehand, and such would be the effect were man purely a selfish being. But the benevolence of our nature gives a very different direction to the painful passion of sympathy, and to the desire involved in it: instead of avoiding distress, we fly to it in order to afford relief; and our sympathy cannot be otherwise gratified than by giving all the succour in our power. Thus external signs of distress, though disagreeable, are attractive: and the sympathy they inspire is a powerful cause, impelling us to afford relief even to a stranger, as if he were our friend or relation.

It is a noted observation, that the deepest tragedies are the most crowded: which in an overly view will be thought an unaccountable bias in human nature. Love of novelty, desire of occupation, beauty of action, make us fond of theatrical representations; and when once engaged, we must follow the story to the conclusion, whatever distress it may create. But we generally become wise by experience; and when we foresee what pain we shall suffer during the course of the representation, is it not surprising that persons of reflection do not avoid such spectacles altogether? And yet one who has scarce recovered from the distress of a

deep tragedy, resolves coolly and deliberately to go to the very next, without the slightest obstruction from self-love. The whole mystery is explained by a single observation: that sympathy, though painful, is attractive; and attaches us to an object in distress, instead of prompting us to fly from it. And by this curious mechanism it is, that persons of any degree of sensibility are attracted by affliction still more than by joy.

PASSIONS, in painting, are the external expressions of the different dispositions and affections of the mind; but particularly their different effects upon the several features of the face: for though the arms, and indeed every part of the body, serve likewise, by their quick, languid, and variously diversified motions, to express the passions of the soul; yet, in painting, this difference is most conspicuous in the face.

As we have given engravings of Le Brun's drawings of the passions, we shall here subjoin the account which he has given of each of these heads. See plates 127 and 128.

1. The effects of *attention* are, to make the eye-brows sink and approach the sides of the nose; to turn the eye-balls toward the object that causes it; to open the mouth, and especially the upper part; to decline the head a little, and fix it without any other remarkable alteration.

2. *Admiration* causes but little agitation in the mind, and therefore alters but very little the parts of the face; nevertheless the eye-brow rises; the eye opens a little more than ordinary; the eye-ball placed equally between the eye-lids appears fixed on the object; the mouth half opens; and makes no sensible alteration in the cheeks.

3. The motions that accompany *admiration with astonishment* are hardly different from those of simple admiration, only they are more lively and stronger marked; the eye-brows more elevated; the eyes more open; the eye-ball farther from the lower eye-lid, and more steadily fixed; the mouth is more open, and all the parts in a much stronger emotion.

4. *Admiration* begets esteem, and this produces *veneration*, which, when it has for its object something divine or beyond our comprehension, makes the face decline, and the eye-brows bent down; the eyes are almost shut and fixed; the mouth is shut. These motions are gentle, and produce but little alterations in the other parts.

5. Although *rapture* has the same object as *veneration*, only considered in a different manner, its motions are not the same; the head inclines to the left side; the eye-balls and eye-brows rise directly up; the mouth half opens, and the two corners are also a little turned up: the other parts remain in their natural state.

6. The passion of *desire* brings the eye-brows close together and forwards toward the eyes, which are more open than ordinary; the eye-ball is inflamed, and places itself in the middle of the eye; the nostrils rise up and are contracted towards the eyes; the mouth half opens, and the spirits being in motion give a lively glowing colour.

7. Very little alteration is remarked in the face of those that feel within themselves the *sweetness of joy*, or *joy with tranquillity*. The forehead is serene; the eye-brow without motion, elevated in the middle; the eye pretty open and with a laughing air; the eye-ball lively and shining; the corners of the mouth turn up a little; the complexion is lively; the cheeks and lips are red.

8. *Laughter*, which is produced by joy mixed with surprise, makes the eye-brows rise towards the middle of the eye, and bend towards the sides

of the nose; the eyes are almost shut, and sometimes appear wet, or shed tears, which make no alteration in the face; the mouth half open shows the teeth; the corners of the mouth drawn back cause a wrinkle in the cheeks, which appear so swelled as to hide the eyes in some measure; the nostrils are open, and all the face is of a red colour.

9. *Acute pain* makes the eye-brows approach one another, and rise towards the middle; the eye-ball is hid under the eye-brows; the nostrils rise and make a wrinkle in the cheeks; the mouth half opens and draws back: all the parts of the face are agitated in proportion to the violence of the pain.

10. *Simple bodily pain* produces proportionally the same motions as the last, but not so strong. The eye-brows do not approach and rise so much; the eye-ball appears fixed on some object; the nostrils rise, but the wrinkles in the cheeks are less perceivable; the lips are further asunder towards the middle, and the mouth is half open.

11. The dejection that is produced by *sadness* makes the eye-brows rise towards the middle of the forehead more than towards the cheeks; the eye-ball appears full of perturbation; the white of the eye is yellow; the eye-lids are drawn down, and a little swelled; all about the eyes is livid; the nostrils are drawn downward; the mouth is half open, and the corners are drawn down; the head carelessly leaning on one of the shoulders: the face is of a lead colour; the lips pale.

12. The alterations that *weeping* occasions are strongly marked. The eye-brows sink down towards the middle of the forehead; the eyes are almost closed, wet, and drawn down towards the cheeks; the nostrils swelled; the muscles and veins of the forehead appear; the mouth is shut, and the sides of it are drawn down, making wrinkles on the cheeks: the under lip pushed out, presses the upper one: all the face is wrinkled and contracted; its colour is red, especially about the eye-brows, the eyes, the nose, and the cheeks.

13. The lively attention to the misfortunes of another, which is called *compassion*, causes the eye-brows to sink towards the middle of the forehead; the eye-ball to be fixed upon the object; the sides of the nostrils next the nose to be a little elevated, making wrinkles in the cheeks; the mouth to be open; the upper lip to be lifted up and thrust forwards; the muscles and all the parts of the face sinking down and turning towards the object which excites the passion.

14. The motions of *scorn* are lively and strong. The forehead is wrinkled; the eye-brow is knit; the side of it next the nose sinks down, and the other side rises very much; the eye is very open, and the eye-ball is in the middle; the nostrils rise, and draw towards the eyes, and make wrinkles in the cheeks; the mouth shuts, its sides sinking down, and the under lip is pushed out beyond the upper one.

15. An object despised sometimes causes *horror*, and then the eye-brow knits, and sinks a great deal more. The eye-ball, placed at the bottom of the eye, is half covered by the lower eye-lid; the mouth is half open, but closer in the middle than the sides, which being drawn back, makes wrinkles in the cheeks; the face grows pale, and the eyes become livid; the muscles and the veins are marked.

16. The violence of *terror* or *fright* alters all the parts of the face; the eye-brow rises in the middle; its muscles are marked, swelled, pressed one against the other, and sunk towards the nose,

which draws up as well as the nostrils; the eyes are very open; the upper eye-lid is hid under the eye-brow; the white of the eye is encompassed with red; the eye-ball fixes toward the lower part of the eye; the lower part of the eye-lid swells and becomes livid; the muscles of the nose and cheeks swell, and these last terminate in a point toward the sides of the nostrils; the mouth is very open, and its corners very apparent; the muscles and veins of the neck stretched; the hair stands on end; the colour of the face, that is, the end of the nose, the lips, the ears, and round the eyes, is pale and livid; and all ought to be strongly marked.

17. The effects of *anger* show its nature. The eyes become red and inflamed; the eye-ball is staring and sparkling; the eye-brows are sometimes elevated and sometimes sunk down equally; the forehead is very much wrinkled, with wrinkles between the eyes; the nostrils are open and enlarged; the lips pressing against one another, the under one rising over the upper one leaves the corners of the mouth a little open, making a cruel and disdainful grin.

18. *Hatred or jealousy* wrinkles the forehead; the eye-brows are sunk down and knit; the eye-ball is half hid under the eye-brows, which turn towards the object; it should appear full of fire, as well as the white of the eye and the eye-lid; the nostrils are pale, open, more marked than ordinary, and drawn backward so as to make wrinkles in the cheeks; the mouth is so shut as to show the teeth are closed; the corners of the mouth are drawn back and very much sunk; the muscles of the jaw appear sunk; the colour of the face is partly inflamed and partly yellowish; the lips pale or livid.

19. As *despair* is extreme, its motions are so likewise; the forehead wrinkles from the top to the bottom; the eye-brows bend down over the eyes, and press one another on the sides of the nose: the eye seems to be on fire, and full of blood; the eye-ball is disturbed, hid under the eye-brow, sparkling and unfixed; the eye-lid is swelled and livid; the nostrils are large, open, and lifted up; the end of the nose sinks down; the muscles, tendons, and veins are swelled and stretched; the upper part of the cheeks is large, marked, and narrow towards the jaw; the mouth drawn backwards is more open at the sides than in the middle; the lower lip is large and turned out; they gnash their teeth; they foam; they bite their lips, which are pale; as is the rest of the face; the hair is straight, and stands on end.

Other French writers have given instructions respecting the expression of the passions, differing much from those of Le Brun. All of them whom we have consulted make so many divisions and subdivisions of passions, that a philosopher cannot follow them in metaphysical theory, nor a painter exhibit their effects upon canvas. Nature therefore must be his guide, particularly in treating those very minute and almost imperceptible differences, by which, however, things very different from each other are often expressed. This is particularly the case with regard to the passions of laughing and crying; as in these, however contrary, the muscles of the face operate nearly in the same manner. As the famous Pietro de Cortona was one day finishing the face of a crying child in a representation of the iron age, with which he was adorning the floor called hot-bath in the royal palace of Pitti, Ferdinand II. who happened to be looking over him for his amusement, could not forbear expressing his approbation, by

crying out, "Oh how well that child cries!" To whom the artist: "Has your majesty a mind to see how easy it is to make children laugh? Behold, I'll prove it in an instant." And taking up his pencil, by giving the contour of the mouth a concave turn downwards, instead of the convex upwards which it before had, and with little or no alteration in any other part of the face, he made the child, who a little before seemed ready to burst its heart with crying, appear in equal danger of bursting its sides with immoderate laughter; and then, by restoring the altered features to their former position, he soon set the child a crying again. See farther, The Anatomy of Expression in Painting, by Charles Bell.

PASSION-FLOWER. See PASSIFLORA.

PASSION-WEEK, the week immediately preceding the festival of Easter; so called, because in that week our Saviour's passion and death happened. The Thursday of this week is called Maunday Thursday; the Friday, Good-Friday; and the Saturday, the Great Sabbath.

PA'SSIONATE. *a.* (*passionné*, French.)

1. Moved by passion; feeling or expressing great commotion of mind (*Clarendon*). 2. Easily moved to anger (*Prior*).

To PA'SSIONATE. *v. n.* (from *passion*.)

An old word, now obsolete. 1. To affect with passion (*Spenser*). 2. To express passionately (*Shakespeare*).

PA'SSIONATELY. *ad.* (from *passionate*.)

1. With passion; with desire, love, or hatred; with great commotion of mind (*South*). 2. Angrily (*Locke*).

PA'SSIONATENESS. *s.* (from *passionate*.)

1. State of being subject to passion. 2. Vehemence of mind (*Boyle*).

PA'SSIVE. *a.* (*passif*, Fr. *passivus*, Latin.)

1. Receiving impression from some external agent (*South*). 2. Unresisting; not opposing (*Pope*). 3. Suffering; not acting. 4. (In grammar.) A verb *passive* is that which signifies passion or the effect of action: as, *doceor*, I am taught (*Clarke*).

PA'SSIVELY. *ad.* (from *passive*.) With a passive nature (*Dryden*).

PA'SSIVENESS. *s.* (from *passive*.)

1. Quality of receiving impression from external agents. 2. Passibility; power of suffering. (*D. of Piety*). 3. Patience; calmness (*Fell*).

PASSIVITY. *s.* (from *passive*.) Passiveness.

An innovated word (*Cheyne*).

PASSOVER, *פסחא*, a solemn feast, celebrated among the Jews, on the fourteenth day of the moon next after the vernal equinox.

This feast was called, by the ancient Latins and Greeks, *pascha*, not from *פסח*, I suffer, as Chrysostom, Irenæus, and Tertullian imagine, but from the Hebrew *פסח* *pesahh*, passage, leap; the design of the feast being to commemorate the destroying angel's passing over the houses of the Israelites, when he entered in, and destroyed the first-born in those of the Egyptians. Exod. xii. 27. Many erroneously imagine, that it was in memory of their passing the Red Sea that the passover was instituted; though it is certain the feast

was held, and had its name, before the Israelites took a step of their way out of Egypt, and consequently several days before their passing the Red Sea.

Besides the passover observed on the fourteenth of the first month, there was a second passover held on the fourteenth of the second month after the equinox, instituted by God in favour of travellers, and sick persons, who could not attend at the first, nor be at Jerusalem on the day.

The Greeks, and even some of the catholic doctors, from the thirteenth, eighteenth, and nineteenth chapters of St. John, take occasion to conclude, that Jesus anticipated the day marked for the passover in the law; but the authority of three evangelists seems to evince the contrary. See Whitby's Dissertation on this subject, in an appendix to the fourteenth chapter of St. Mark.

F. Lamy is of opinion, that he did not attend at the passover the last year of his life; which sentiment has drawn upon him abundance of opposers. F. Hardouin maintains, that the Galileans celebrated the passover on one day, and the Jews on another.

PASSOVER denotes also the sacrifice killed.

PASS-PAROLE, a command given in the head of an army, and thence communicated to the rear, by passing it from mouth to mouth.

PASS-PAR-TOUT, a master-key; or key that opens indifferently several locks belonging to the same lodge or apartment.

PASSPORT, a licence or letter from a prince or governor, granting liberty and safe-conduct to travel, enter, and go out of, his territories, freely, and without molestation. The passport is properly given to friends, and the safe-conduct to enemies.

The violation of safe-conducts, or passports, expressly granted by the king or his ambassadors to the subjects of a foreign power in time of mutual war, or committing acts of hostility against such as are in amity, league, or truce with us, who are here under a general implied safe-conduct, are breaches of the public faith, without which there can be no intercourse or commerce between one nation and another; and such offences may, according to the writers upon the law of nations, be a just ground of a national war. And it is enacted by the statute 31 Henry VI. c. 4. now in force, that if any of the king's subjects attempt, or offend, upon the sea, or in any port within the king's obeysance, or against any stranger in amity, league, or truce, or under safe-conduct, and especially by attacking his person, or spoiling him, or robbing him of his goods; the lord chancellor, with any of the justices of either the king's bench or common pleas, may cause full restitution and amends to be made to the party injured.

Pasquier takes passport to have been introduced for passe-par-tout. Balzac mentions a very honourable passport given by an emperor to a philosopher in these terms: "If there be any one on land, or sea, hardy enough to molest Potamon, let him consider whether he be strong enough to wage war with Cæsar."

PASSPORT is also used for a licence granted by a prince for the importing or exporting merchandizes, moveables, &c. without paying the duties.

Merchants sometimes procure such passports for certain kinds of commodities; and they are always given to ambassadors and ministers, for their baggage, equipage, &c.

PASSPORT is also a licence obtained for the importing or exporting of merchandizes deemed contraband, and declared such by tariffs, &c. as gold, silver, precious stones, ammunition of war, horses, corn, wool, &c. upon paying duties.

PASSY, a village of France, in the department of Paris, near the town of St. Denys. Here is a considerable manufacture for speedily bleaching cotton and linen cloth.

PAST. *part. a.* (from *pass.*) 1. Not present; not to come (*Swift*). 2. Spent; gone through; undergone (*Pope*).

PAST. *s.* Elliptically used for past time (*Fenton*).

PAST. *pre.* 1. Beyond in time: *it is past the time of history* (*Hebrews*). 2. No longer capable of: *he is past learning* (*Hayward*). 3. Beyond; out of reach of: *the ship is past cannon-shot* (*Calamy*). 4. Beyond; further than: *we are not past the fens* (*Numbers*). 5. Above; more than: *the well was past ten feet deep* (*Spenser*).

PASTE, *s.* (*paste*, French.) 1. Any thing mixed up so as to be viscous and tenacious (*Dryden*). 2. Flour and water boiled together so as to make a cement. 3. Artificial mixture, in imitation of precious stones.

To PASTE, *v. a.* (*paster*, Fr. from the noun.) To fasten with paste (*Locke*).

PASTEBOARD. *s.* (*paste* and *board*.) Masses made anciently by pasting one board on another; now made sometimes by macerating paper, and casting it in moulds, and sometimes by pounding old cordage and casting it in forms (*Dryden*).

PA'STEBOARD. *a.* Made of pasteboard (*Mortimer*).

PASTER OF A HORSE, the part which intervenes between the joint of that name and the coronet of the hoof. This part should be short, especially in middle-sized horses; because long pasterns are weak, and cannot so well endure labour. Some horses indeed have them so long and flexible, that in walking they almost touch the ground with them, which is a great imperfection, and shows the animal unfit for any sort of fatigue.

PASTER-JOINT, in the manage, the fetlock of a horse: the joint above the pastern, which serves for a second knee in each fore-leg, and a second hough in each hind-leg. A horse is short or long-jointed, according to the shortness or length of the pastern, the short-jointed is the most esteemed.

PASTES for birds: the common food provided for them in aviaries, which may be thus prepared.

Grind half a peck of the finest horse beans, well dried, very fine, and bolt them through a fine boulder, such as is used for wheat meal;

or if your stock of birds do not require so great a quantity, use in the following proportion.

Take of the above meal, two pounds; of the best sweet almonds, blanched, one pound; beat these very well in a mortar, and add a quarter of a pound of fresh butter: put them into a copper saucepan, well tinned, mix all well together, and set the pan over a charcoal fire, that the paste may not smell of smoak, and keep continually stirring it all the while it stands upon the fire with a wooden-spoon, that so it may boil gradually, and not burn; then take four yolks of eggs, and a little saffron, and when the butter is melted, having some virgins-honey ready, drop in some by degrees, continually stirring it, that all the ingredients may incorporate.

This being done, take a fine cullender, and strain the compound through, which should be thin, and not in lumps; the remainder of the paste may be beaten in a mortar again, and if it will not pass through the holes, set it upon the fire again, and let it boil gently, and then try it through the cullender, till it comes to such a quantity and quality as is fit for the number of birds you keep. Repeat this as often as you have occasion.

This paste may be mixed with any bird-meat whatever, is a strengthening diet, and will continue good for six months if you pour a little melted clarified honey upon it.

PASTES for fishing are variously compounded; almost according to the angler's own fancy; but there should always be a little cotton wool, shaved lint, or fine flax, to keep the parts of it together, that it may not fall off the hook. White bread and honey will make a proper paste for carp or tench. Fine white bread alone, with a little water, will serve for roach and dace; and mutton suet and soft new cheese for barbels. Strong cheese with a little butter, and coloured yellow with saffron, will make a good winter paste for a chub.

But among all the variety of pastes, there is none so often used as the simple and plain one made with white bread and milk, which requires only clean hands.

The following observations concerning pastes may be of use to a young angler, being all founded on experience:

In September, and all the winter months, when you angle for chub, carp, and bream, with paste, let the bait be as big as a large hazle nut: but for roach and dace, the bigness of an ordinary bean is sufficient.

You may add to any paste, assa-fœtida, oil of ivy, oil of petre, gum ivy, and many other things, which sometimes wonderfully increase your sport.

PASTE, in the glass-trade, a kind of coloured glass, made of calcined crystal, lead, and other metallic preparations so as to imitate the natural gems. The basis of these compositions is a pure glass, prepared from pounded quartz, fused with alkali, with the addition of borax and of oxyd of lead. The latter gives density to the glass, a susceptibility of receiving a higher polish, and a greater refractive power, by which the lustre is increased. Different

colours are obtained by the addition of various metallic oxyds. The oxyd of gold gives a red; of cobalt, blue; of manganese, purple; of lead, yellow; and of iron, green: and these colours are so rich, as to be equal, or even superior, to those of natural gems, though in lustre, hardness, and durability, the pastes are far inferior. They may be distinguished by their inferior specific gravity, and their softness, which is such that they can be scratched by the knife.

PASTIL or PASTEL, among painters, a kind of paste made of different colours ground up with gum-water, in order to make crayons.

PASTIL, in pharmacy, is a dry composition of sweet-smelling resins, aromatic woods, &c. sometimes burnt to clear and scent the air of a chamber.

PASTIME. *s.* (*pass* and *time*.) Sport; amusement; diversion (*Watts*).

PASTINACA. Parsnep. In botany, a genus of the class pentandria, order digynia. Fruit elliptic, compressed, flat; petals involute, entire. Three species.

1. *P. lucida*. Lucid parsnep. Leaves simple, heart-shaped, lobed, lucid, acutely crenate. A native of the south of Europe.

2. *P. opoponax*. Rough parsnep. Leaves pinnate; leaflets incomplete at the base on the upper side; root-leaves simple, heart-shaped, acutely crenate; flowers umbelled, yellow, appearing in July: a native of the south of Europe. The inspissated juice of the stem is the opoponax of the shops.

3. *P. sativa*. Common parsnep. Leaves simply pinnate, downy underneath, sometimes glabrous. Its roots are sweet and nutritious, and in high esteem as an article of food. They possess an aromatic flavour, more especially those of the wild plant, and are exhibited in calculous complaints for their diuretic and sheathing qualities. The parsnep is to be propagated by sowing the seeds in February or March, in a rich mellow soil, which must be deep dug, that the roots may be able to run deep without hindrance.

It is a common practice to sow carrots at the same time, upon the same ground with the parsneps; and if the carrots are designed to be drawn young, there is no harm in it. The parsneps when they are grown up a little, must be thinned to a foot distance, and carefully kept clear of weeds. They are finest tasted just at the season when the leaves are decayed; and such as are desirous to eat them in spring, should have them taken up in autumn, and preserved in sand. When the seeds are to be saved, some very strong and fine plants should be left for it at four feet distance, and towards the end of August, or in the beginning of September, the seeds will be ripe: they must then be carefully gathered, and dried on a coarse cloth. They should always be sown the spring following, for they do not keep well.

PASTO, or ST. JUAN DE PASTO, a town of New Granada, in Popayan, seated in a valley, 120 miles N. by E. of Quito. Lon. 76. 55 W. Lat. 1. 50 N.

PASTOR, originally, signifies one that (*pasceit*) feeds. Hence it was anciently used

for a shepherd, or advocate; and is now appropriated to a minister, or one that has the cure of souls.

PASTORAL, something that relates to shepherds, *pastores*. The poets represent the innocence of a pastoral life, and pastoral manners, in the most agreeable light. We must not imagine them so beautiful in nature as in their descriptions.

PASTORAL, in poetry, denotes a composition the subject whereof is something in the pastoral, or at least in rural life, and the persons shepherds, or at least rustics.

Most authors, except the English, esteem pastoral of the dramatic kind; and define it a dramatic piece, wherein the persons are clad like nymphs and shepherds, and act their own amours. The scene is always in the fields or the woods; whence Tasso calls pastoral, *favola boscareccia*.

Such are the Pastor Fido, of Guarini; the Aminta, of Tasso; the Sylvia, of Mairet, the French poet; and the Comus, of Milton, &c. Tasso assumes to himself the honour of having invented pastoral; but the first idea of this kind of drama seems to be Beccari's, who made the first attempt of this kind in 1552. But Tasso's Aminta, which did not appear till the year 1573, effacing what had been done by Beccari, the first author was forgot, and Tasso was left as the inventor.

It is certain this kind of pastoral fable, composed according to the rules of the stage, was unknown among the ancients. The Greeks and Latins have indeed introduced shepherds in their eclogues; but these eclogues had nothing theatrical in them; nor were the shepherds ever brought upon the stage.

This kind of dramatic pastoral is as yet but little known among us: nor have we any thing considerable under the title pastorals, but country pieces after the manner of the eclogues or idyllions of the ancients.

Every pastoral, even in this last view, should have a little plot or fable, which may deserve the title of a pastoral scene. It must be simple, and but one; yet not so as to refuse all digressions, provided they be but short. This rule of the plot is every where observed by Virgil.

PASTORAL, *a.* (*pastoralis*, Latin.) 1. Rural; rustic; beseeching shepherds; imitating shepherds (*Sidney*). 2. Relating to the care of souls (*Hooker*).

PASTORAL-STAFF. See **CROSIER**.

PASTORALE (Ital.) In music, an epithet applied to soft rural movements, generally written in twelve quavers, and moving by alternate crotchets and quavers, like the Siciliano.

PASTRY, *s.* (*pastisserie*, Fr. from *paste*.) 1. The act of making pies (*King*). 2. Pies or baked paste (*Tusser*). 3. The place where pastry is made (*Shakspeare*).

PASTRY-COOK, *s.* (*pastry* and *cook*.) One whose trade is to make and sell things baked in paste (*Arbutnot*).

PASTURABLE, *a.* (from *pasture*.) Fit for pasture.

PASTURAGE, *s.* (*pasturage*, French.) 1. The business of feeding cattle (*Spenser*). 2. Lands grazed by cattle (*Addison*). 3. The use of pasture (*Arbutnot*).

PASTURE, *s.* (*pasture*, Fr.) 1. Food; the act of feeding (*Brown*). 2. Ground on which cattle feed (*Locke*). 3. Human culture; education (*Dryden*).

To PASTURE, *v. a.* (from the noun.) To place in a pasture.

To PASTURE, *v. n.* (from the noun.) To graze on the ground (*Milton*).

PASTURE LAND. See **HUSBANDRY**.

PASTY, *s.* (*paste*, French.) A pie of crust raised without a dish (*Shakspeare*).

PAT, *a.* (from *pas*, Dutch, *Skinner*.) Fit; convenient; exactly suitable (*Atterbury*).

PAT, *s.* (*patte*, French.) 1. A light quick blow; a tap (*Collier*). 2. A small lump of matter beat into shape with the hand.

To PAT, *v. a.* (from the noun.) To strike lightly; to tap (*Bacon*).

PATACHE, *s.* A small ship (*Ainsworth*).

PATACCOON, *s.* A Spanish coin worth four shillings and eight pence English (*Ains*).

PATÆCI, in mythology, images of gods which the Phœnicians carried on the prows of their galleys. Herodotus, lib. iv. calls them *πατακιοι*. The word is Phœnician, and derived from *pethica*, i. e. *titulus*. See Bochart's Chanaan, lib. ii. cap. 3. But Scaliger does not agree. Morin derives it from *πατακας*, monkey, this animal having been an object of worship among the Egyptians, and hence might have been honoured by their neighbours. Mr. Elsner has observed, that Herodotus does not call the patæci, gods; but that they obtained this dignity from the liberality of Hesychius and Suidas, and other ancient lexicographers, who place them at the stern of ships; whereas Herodotus placed them at the prow. Scaliger, Bochart, and Selden have taken some pains about this subject.—Mr. Morin has also given us a learned dissertation on this head in the *Memoires de l'Acad. des Inscript. et Belles Lettres*, tom. i.; but Mr. Elsner thinks it defective in point of evidence.

PATAGONIA, a country in the most southern part of S. America, bounded on the N. by Paraguay and Chili, and extending 1100 miles on the eastern coast, from Rio de la Plata to the straits of Magellan. The natives of Patagonia are tall, stout, and well made, some of them six feet five and seven inches in height; but their hands and feet are remarkably small. Their colour is a kind of bronze. They are all painted, and clothed nearly in the same manner: the circles round the two eyes are, some white and red, and some red and black. Their teeth are as white as ivory, remarkably even and well set. They have no other clothing than skins, which they wear with the hair inward; and a piece of leather covers their private parts. This country has no timber in the S. parts, though the N. contains an immense quantity, and numerous flocks of cattle. The E. coast is generally low. The principal harbour is that of port St. Julian.

PATANI, a town on the N.E. coast of the peninsula of Malaya, capital of a kingdom of the same name, with a well-defended harbour. The inhabitants have some trade with the Chinese: It is 300 miles N. by W. of Malacca. Lon. 100. 50 E. Lat. 7. 5 N.

PATAY, a town of France, in the département of Loiret, where the English were defeated in 1429, by Joan of Arc. It is 15 miles N.W. of Orleans.

PATAVINITY, among critics, denotes a peculiarity of Livy's diction; derived from Patavium or Padua, the place of his nativity; but wherein this patavinity consists, they are by no means agreed. Asinius Pollio, according to Quintilian, taxed Livy with patavinity. But what he meant by this censure we believe no man can say. Morhof believes it to be a singular turn of expression, and some phrases peculiar to the Paduese. All we certainly know about it is, that it was a fault in the language of Livy, not in the sentiments or manner. In all probability, it is one of those delicacies that are lost in a dead language. Dan. Georg. Morhof published a treatise De Patavinitate Liviana, at Kiel, in 1685, where he explains, very learnedly, the urbanity and pergerinity of the Latin tongue.

PATARA, a town of Lycia, situate on the eastern side of the mouth of the river Xanthus, with a capacious harbour, a temple and an oracle of Apollo, surnamed Patareus. The god was supposed by some to reside for the six winter months at Patara, and the rest of the year at Delphi.

To PATCH. v. n. (*putzer*, Danish; *pezzare*, Ital.) 1. To cover with a piece sewed on (*Locke*). 2. To decorate the face with small spots of black silk (*Addison*). 3. To mend clumsily; to mend so as that the original strength or beauty is lost (*Dryden*). 4. To make up of shreds or different pieces.

PATCH. s. (*pezzo*, Ital.) 1. A piece sewed on to cover a hole (*Dryden*). 2. A piece inserted in mosaic or variegated work (*Locke*). 3. A small spot of black silk put on the face (*Suckling*). 4. A small particle; a parcel of land (*Shakspeare*). 5. A paltry fellow: obsolete (*Shakspeare*).

PATCHER. s. (from *patch*.) One that patches; a butcher.

PATCHERY. s. (from *patch*.) Butchery; bungling work: not used (*Shakspeare*).

PATCHWORK. s. (*patch* and *work*.) Work made by sewing small pieces of different colours interchangeably together (*Swift*).

PATE. s. The head (*Spenser. South*).

PATED. a. (from *pate*.) Having a pate. It is used only in composition: as, long-pated or cunning; shallow-pated or foolish.

PATEE, or PATTEE, in heraldry, a cross small in the centre, and widening to the extremes, which are very broad.

PATEFACTION. s. (*patefactio*, Lat.) Act or state of opening (*Ainsworth*).

PATEL, a celebrated French painter, commonly called by his countrymen the French Claude, from his successful imitation of that

great master. His works shew a mind that had studied nature with great observation. We have so little knowledge of him, that it is not known in what age he lived.

PATELLA. (*patina*, a dish; so named from its shape). *Rotula*. The knee pan. A small flat bone, which in some measure resembles the common figure of the heart with its point downwards, and is placed at the fore part of the joint of the knee. It is thicker in its middle part than at its edge. Anteriorly, it is a little convex, and rough for the insertion of muscles and ligaments; posteriorly, it is smooth, covered with cartilage, and divided by a middle longitudinal ridge, into two slightly concave surfaces, of which the external one is the largest and deepest. They are both exactly adapted to the pulley of the os femoris. The edges of this posterior surface are rough and prominent, where the capsular ligament is attached, and below is a roughness at the point of the bone, where the upper extremity of a strong tendinous ligament is fixed, which joins this bone to the tuberosity at the upper end of the tibia. This ligament is of considerable thickness, about an inch in breadth, and upwards of two inches in length. The rotula is composed internally of a cellular substance, covered by a thin bony plate; but its cells are so extremely minute, that the strength of the bone is, upon the whole, very considerable. In new-born children it is entirely cartilaginous. The use of this bone seems to be, to defend the articulation of the joint of the knee from external injury. It likewise tends to increase the power of the muscles which act in the extension of the leg, by removing their direction farther from the center of motion, in the manner of a pulley. When we consider the manner in which it is connected with the tibia, we find that it may very properly be considered as an appendix to the latter, which it follows in all its motions, so as to be to the tibia what the olecranon is to the ulna; with this difference, however, that the rotula is moveable, whereas the olecranon is a fixed process. Without this mobility the rotatory motion of the leg would have been prevented.

PATELLA. Limpet. In zoology, a genus of the class vermes, order testacea. Animal a limax; shell univalve, subconic, shaped like a bason; without spine. Two hundred and forty species, scattered over the globe; but the greater part found in a fossil state, or thrown up by the tide, and the natural residence unknown. About eight are inhabitants of our own coasts. The genus was known to the ancient Greeks, who employed the animal as an esculent. It is subdivided into the following sections.

A. Furnished with an internal lip; shell entire.

B. With the margin angular, or irregularly toothed.

To this division belongs

1. *P. vulgata*, or common limpet-shell. Found on our own shores: with about fourteen obsolete angles, and a dilated, acute crenate margin; crown central. It is found

inhabiting the marine rocks of Europe and India; two inches high, three or four wide: in the older shells the margin is nearly even, and the number of ribs irregular. The shell varies in colour and marks, but is generally cinereous, white or reddish, with or without bands.

2. *P. badia*. Shell subconvex, brown, within bay, with twelve larger rays each surrounded by a rib, and as many smaller ones. Residence unknown: two and three quarters inches long. Shell more or less flat, rarely pellucid, often sprinkled with green or cinereous dots, varied or undulate with grey; sometimes inclining to pale yellow, or liver-colour, or spotted with black; the margin and the crown varied with rays of different colours, the latter often with five rows of blue dots; the bottom with a spatulate liver-colour, or greenish spot surrounded with a single or double differently coloured band; the inner surface often inclining to brown, pale yellow, liver-colour, or grey.

C. With a pointed recurved tip or crown.

3. *P. lacustris*. Shell very entire, oval, membranaceous, with a nearly central mucronate reflected shell. Inhabits the fresh waters of our own country and of other parts of Europe; from one and a half to two and a half lines long. Shell very thin and brittle, pellucid, white, above convex, beneath concave; crown with a very minute point: the inhabitant with two truncate concealed tentacles, furnished with eyes at the interior angle.

D. Very entire, and not pointed at the tip or crown.

E. With the crown or tip perforated.

PATELLÆ. In conchology, dish-shells, so denominated from their shape: larger in general than the nautilus, pearl or mother-of-pearl shells, as oysters, &c.

PATEN. *s.* (*petina*, Latin.) A plate (*Shakspeare*).

PATENT, something that stands open or expanded: thus a leaf is said to be patent when it stands nearly at right angles with the stalk.

PATENT, or *LETTERS PATENT*, are writings sealed with the great seal of England, by which a man is authorised to do, or to enjoy, any thing which of himself he could not. They are so called on account of their form, being open, with their seal affixed, ready to be exhibited for the confirmation of the authority delegated by them. Letters patent for new inventions are obtained by petition to the crown: they go through many offices, and are usually granted for the term of 14 years, upon condition that the patentee specify his invention or improvement, in such a manner that the public may receive the benefit of it, and may be at liberty to practise or employ such contrivance at the expiration of the exclusive privilege. If, however, it should be found or proved, that the patentee's claims are not supported by originality; or, that he has wilfully disguised his invention, by giving a confused and erroneous specification, the privilege becomes void; and any person is permitted to adopt and make use of it with impunity. Many pa-

tents, indeed, are believed to have been surreptitiously obtained by speculative persons; who, from sordid, lucrative motives, swear themselves to be the inventors of things which they have read in foreign books, such as are not in general circulation. These unprincipled adventurers ought to be rigorously examined, whether they have any, and what pretensions to an art or manufacture, of which they profess to be adepts. Thus, it would be easily discovered, that they are plagiarists, and impostors, who evade the provisions made by law. A patent at the lowest cost, and when no opposition is given to it, will, for fees of office, specification, &c. cost for the three branches of the United Kingdom about three hundred pounds. The only complete published repository of specifications of patent inventions is the Repertory of Arts and Manufactures, now extending to several octavo volumes: it is published monthly, and contains descriptions of many highly curious and important inventions. Abridgements of several of these specifications may be seen in the Retrospect of Discoveries, the Monthly Magazine, and a few other periodical publications.

PATENTEE. *s.* One who has a patent.

PATER (Paul), born at Menensdorf, in Hungary, in 1656, and driven from his country when very young, because of his attachment to the protestant religion. The duke of Wolfembuttel made him his librarian; and he became professor of mathematics in the college of Dantzic, where he died in 1724. He was the author of numerous works on philosophy and literature. (*Watkins*).

PATER (John Baptiste), a celebrated landscape painter, born at Valenciennes, in 1695, and the disciple of Anthony Watteau. He had a good taste for colouring, but he neglected the study of nature. He died in 1736. (*Watkins*).

PATERA, among antiquaries, a goblet, or vessel, used by the Romans in their sacrifices, wherein they received the blood of their victims, offered their consecrated meats to the gods, and wherewith they made libations. The word is formed from *pateo*, I am open, *quot pateat*; because it had a great aperture; in contradistinction to bottles, &c.

The patera is an ornament in architecture, frequently introduced in friezes, fascias, and imposts, over which are hung festoons of husks or flowers; and they are sometimes used by themselves, to ornament a space; and in this case it is common to hang a string of husks or drapery over them.

PATERCULUS (Caius Velleius), an ancient Roman historian, who flourished under the emperor Tiberius Cæsar. He commanded the cavalry in Germany under Tiberius, whom he accompanied for nine years successively, and was rewarded with the prætorship. He wrote an epitome of the Roman history in two books, which is extant. He is supposed to have died in the year of Rome 784, and in his 50th year.

One manuscript only has had the luck to be

found, as well of this author among the Latins, as Hesychius among the Greeks: in which, says a great critic of our own nation, "the faults of the scribes are found so numerous, and the defects so beyond all redress, that, notwithstanding the pains of the learned and most acute critics for two whole centuries, these books still are, and are like to continue, a mere heap of errors." No ancient author but Priscian makes mention of Paterculus: the moderns have done him infinitely more justice, and have illustrated him with notes and commentaries. He was first published, from the manuscript of Morbac, by Rhenanus, at Basil, in 1520; afterwards by Lipsius, at Leyden, in 1851; then by Gerard Vossius, in 1639; next by Boeclerus, at Strasburg, in 1642; then by Tysius and others; and, lastly, by Peter Berman, at Leyden, 1719, in 8vo. To the Oxford edition in 1693, 8vo. were prefixed the *Annales Velleiani* of Mr. Dodwell, which show deep learning and a great knowledge of antiquity.

PATERNAL. *a.* (*paternus*, Latin.) 1. Fatherly; having the relation of a father; pertaining to a father (*Hammond*). 2. Hereditary; received in succession from one's father (*Dryden*).

PATERNITY. *s.* (from *paternus*, Latin.) Fathership; the relation of a father (*Arbuth.*).

PATER-NOSTER, the Lord's prayer, so called from the two first words thereof in Latin. It is also sometimes used for a chapel or string of beads. And, in architecture, the same term is used for a sort of ornament cut in the form of beads, either oval or round, used on astragals, baguettes, &c.

PATH. *s.* (*pað*, Saxon.) Way; road; track; a narrow way; any passage (*Addison*).

PATH OF THE VERTEX, a term frequently used by Mr. Flamsteed, in his *Doctrine of the Sphere*, denoting a circle, described by any point of the earth's surface as the earth turns round its axis. This point is considered as vertical to the earth's centre; and is the same with what is called the vertex or zenith in the Ptolemaic projection.

PATHETIC, whatever relates to the passions, or that is proper to excite or awake them. The word comes from the Greek *παθος*, passion or emotion. See **PASSION**.

PATHETIC, in music, something very moving, expressive, or passionate; capable of exciting pity, compassion, anger, or other passions. Thus we speak of the pathetic style, a pathetic figure, pathetic song, &c. The chromatic genus, with its greater and lesser semitones, either ascending or descending, is very proper for the pathetic; as is also an artful management of discords; with a variety of motions, now brisk, now languishing, now swift, now slow. Nieuwentyt speaks of a musician at Venice who so excelled in the pathetic, that he was able to play any of his auditors into distraction: he says also, that the great means he made use of was the variety of motion, &c.

PATHETICALLY. *ad.* In such a manner as may strike the passions (*Dryden*).

PATHETICALNESS. *s.* (from *pathetical*)

Quality of being pathetic; quality of moving the passions.

PATHETICI. (from *παθος*, an affection, because they direct the eyes to express the passions of the mind.) In anatomy, trochleatores. The fourth pair of nerves. They arise from the crura of the cerebellum laterally, and are distributed in the musculus obliquus superior seu trochlearis.

PATHLESS. *a.* (from *path*.) Untrodden; not marked with paths (*Sandys*).

PATHOGNOMONIC. (*παθογνωμονικός*; from *παθος*, a disease, and *γνωσκω*, to know). A term given to those symptoms which are peculiar to a disease. They are also termed proper or characteristic symptoms.

PATHOLOGICAL. *a.* (from *pathology*.) Relating to the tokens or discoverable effects of a distemper.

PATHOLOGIST. *s.* (*παθος* and *λεγω*.) One who treats of pathology.

PATHOLOGY. (*παθολογία*; from *παθος*, a disease, and *λογος*, a discourse.) The doctrine of diseases. It comprehends nosology, ætiology, symptomatology, and therapia. See **MEDICINE**.

PATHOS. A Greek term literally signifying passion.

PATHWAY. *s.* (*path* and *way*.) A road; a narrow way to be passed on foot (*Shakspeare*).

PATIBLE. *a.* (from *pator*, Lat.) Sufferable; tolerable.

PATIBULARY. *a.* (*patibulaire*, Fr. from *patibulum*, Lat.) Belonging to the gallows.

PATIENCE. *s.* (*patience*, Fr. *patientia*, Lat.) 1. The power of suffering; calm endurance of pain or labour (*Prior*). 2. The quality of expecting long without rage or discontent (*Matthew*). 3. Perseverance; continuance of labour (*Harte*). 4. The quality of bearing offences without revenge or anger (*Harte*). 5. Sufferance; permission (*Hooker*).

For some of the best remarks on the nature of patience, and on the unreasonable expectations with regard to patience from those that are well of those that are sick, with an account of the constituent parts of patience, and remedies against real impatience, we refer to Jeremy Taylor's *Holy Dying*, chap. iii. sections 2, 3, 4, and 5.

PATIENCE, in botany. See **RUMEX**.

PATIENT. *a.* (*patient*, Fr. *patients*, Latin.) 1. Having the quality of enduring (*Ray*). 2. Calm under pain or affliction (*Dryden*). 3. Not revengeful against injuries. 4. Not easily provoked (*Thessalonians*). 5. Persevering; calmly diligent (*Newton*). 6. Not hasty; not vitiously eager or impetuous (*Prior*).

PATIENT. *s.* (*patient*, French.) 1. That which receives impressions from external agents (*Gov. of the Tongue*). 2. A person diseased, under the care of another (*Addison*).

To **PATIENT.** *v. a.* (*patienter*, French.) To compose one's self: obsolete (*Shaks.*).

PATIENTIA. (from *pator*, to bear or suffer). The herb monk's rhubarb, from its gentle purging qualities. See **RHABBARBARUM**.

P A T

P A T

PATIENTLY. *ad.* (from *patient*.) 1.

Without rage under pain or affliction (*Swift*).

2. Without vitious impetuosity (*Calamy*).

PATINE. *s.* (*patina*, Lat.) The cover of a chalice (*Ainsworth*.)

PATKUL (John Reinhold), count, a brave and accomplished man, a native of Livonia, employed to represent the grievances of that province to Charles XI. king of Sweden, in 1689, which commission he discharged with a noble intrepidity and freedom. This remonstrance was construed as rebellious, for which the whole body underwent a process, and Patkul was condemned to lose his estates and honours, and to have his right hand and head cut off. To avoid so cruel a sentence, he fled, and entered into the Russian service. When Charles XIth was dead, and Charles XIIth had deposed Augustus, king of Poland, he obliged that unfortunate prince to deliver Patkul up to him, though he was then invested with the character of envoy extraordinary from the court of Russia. Charles caused him to be broken on the wheel, with every circumstance of ignominy and refined cruelty, in 1707.

PATLY. *ad.* (from *pat*.) Commodiously; fitly.

PATMOS, or **PATINO**, an island of the Archipelago, lying 26 miles S. of the isle of Samos. It is 20 miles in circumference, and one of the most barren in the Archipelago; but is famous for being the place where St. John composed the book of Revelation. A few valleys only are capable of some cultivation; but it abounds with partridges, rabbits, quails, turtles, pigeons, and snipes. In the midst of the island rises a mountain, terminated by the convent of St. John; the abbot of which is the prince of the country, and pays a certain tribute to the grand seignor. The hermitage of the Apocalypse is situate on the side of the mountain between the convent and the port of Scala. It leads to the church of the Apocalypse, which is built against a grotto in a rock, pointed out as the asylum of St. John, during his exile at Patmos. The inhabitants are chiefly Greek Christians, sailors or ship-builders; and have some trade in cotton, and stockings of their own manufacture. The women are generally pretty, but they disfigure themselves by the excessive use of paint. Lon. 26. 24 E. Lat. 37. 24 N.

PATNA, a city of Hindoostan, capital of Bahar, seated on the right bank of the Ganges, opposite the influx of the Gunduck, and fortified with a wall and citadel. In the citadel were confined the prisoners taken in 1764, by Meer Cossim, nabob of Bengal, by whose order they were massacred. The buildings are high, but the streets are narrow. It is a place of considerable trade, 400 miles N.W. of Calcutta. Lon. 85. 0 E. Lat. 25. 35 N.

PATOMAC. See **POTOMAC**.

PATONCE, in heraldry, is a cross, flory at the ends; from which it differs only in this, that the ends, instead of turning down like a fleur-de-lis, are extended somewhat in the pattee form.

PATRAS, an ancient and flourishing town in the Morea, with a Greek archbishop's see. The Jews, who are one-third of the inhabitants, have four synagogues, and there are several handsome mosques and Greek churches. The Jews carry on a great trade in silk, leather, honey, wax, and cheese. There are cypress trees of a prodigious height, and excellent pomegranates, citrons, and oranges. It has been taken and retaken several times; but the Turks are now masters of it. It is seated on the declivity of a hill, near the sea, 20 miles S.W. of Lepanto. Lon. 21. 45 E. Lat. 38. 17 N.

PATRIA, a town of Naples, in Terra di Lavoro, situate near a lake, to which it gives name, 13 miles N.W. of Naples.

PATRIARCH. (*patriarcha*, formed of *πατρις*, a family, and *αρχων*, chief.) One of those first fathers who lived towards the beginning of the world; and who became famous by a long line of descendants.

Abraham, Isaac, and Jacob, and his twelve sons, are the patriarchs of the Old Testament. Seth, Enoch, &c. were antediluvian patriarchs.

Long life and a number of children were the blessings of the patriarchs.

The patriarchal government consisted in the fathers of families, and their first-born after them, exercising all kinds of ecclesiastical and civil authority in their respective households: and to this government, which continued till the time of the Israelites dwelling in Egypt, some have ascribed an absolute and despotic power, extending even to the punishment by death. In proof of this, they allege the curse pronounced by Noah upon Canaan, Gen. ix. 25; but it is replied, that in this affair Noah seems to have acted rather as a prophet than a patriarch. Another instance of supposed despotic power is Abraham's turning Hagar and Ishmael out of his family, Gen. xxi. 9, &c.; but this furnishes no evidence of any singular authority vested in the patriarchs, as such, and peculiar to those ages. The third instance alleged to the same purpose is that of Jacob's denouncing a curse upon Simeon and Levi, Gen. xlix. 7, which is maintained by others to be an instance of prophetic inspiration, more than of patriarchal authority. The fourth instance is that of Judah with regard to Tamar, Gen. xxxviii. 24; with regard to which it is observed, that Jacob, the father of Judah, was still living, that Tamar was not one of his own family, and that she had been guilty of adultery, the punishment of which was death by burning, and that Judah on this occasion might speak only as a prosecutor.

PATRIARCH is also used, in christendom, for the bishops in possession of some of the grand sees, independent of the papal jurisdiction.

The patriarchate has been always esteemed the supreme dignity in the church: so that, to rise by degrees, the bishop had only under him the territory of the city whereof he was bishop; the metropolitan commanded a province, and

had for suffragans the bishops of his province; the primate was the chief of a diocese, and had several metropolitans under him; and the patriarch had under him several dioceses, and the primates themselves were under him. But this order was not always observed.

Usher, Pagi, De Marca, and Morinus, attribute the establishment of the grand patriarchates to the apostles. They suppose that the apostles, according to the description of the world then given by geographers, pitched on the three principal cities in the three parts of the known world; viz. Rome, in Europe; Antioch, in Asia; and Alexandria, in Africa: and thus formed a trinity of patriarchs.

Others, far from attributing this institution to the apostles, maintain that the name patriarch was unknown at the time of the council of Nice; and that, for a long time afterwards, patriarchs and primates were confounded together; as being all equally chiefs of dioceses, and equally superior to metropolitans, who were only chiefs of provinces. Hence it is that Socrates gives the title patriarch to all the chiefs of dioceses, and reckons ten of them. In effect, it does not appear that the dignity of patriarch was appropriated to the five grand sees of Rome, Constantinople, Alexandria, Antioch and Jerusalem, till after the council of Chalcedon, in 451. For when the council of Nice regulated the limits and prerogatives of the three patriarchs of Rome, Antioch, and Alexandria, it did not give them the title of patriarchs, though it allowed them the pre-eminence and privileges thereof. Thus, when the council of Constantinople adjudged the second place to the bishop of Constantinople, who, till then, was only a suffragan of Hecleia, it said nothing of the patriarchate.

Nor is the term patriarchate found in the decree of the council of Chalcedon, whereby the fifth place is assigned to the bishop of Jerusalem; nor did these five patriarchs govern all the churches.

PATRIARCH is also applied to the chief of several churches in the East, who live out of communion with the Roman church: such are the patriarch of the Armenians, residing in the monastery of St. Gregory; the patriarch of the Abyssinians, called Abuna; the patriarchs of the Copti, the Jacobites, &c.

PATRIARCHAL. *a. (patriarchal, Fr.)*

1. Belonging to patriarchs; such as was possessed or enjoyed by patriarchs (*Norris*).
2. Belonging to hierarchial patriarchs (*Atkiffe*).

PATRIARCHAL CROSS, in heraldry, is that where the shaft is twice crossed; the lower arms being longer than the upper ones.

PATRIARCHATE. **PATRIARCHSHIP**. *s. (patriarchat, French, from patriarch.)* A bishopric superiour to archbishoprics (*Atkiffe*).

PATRIARCHY. *s.* Jurisdiction of a patriarch; patriarchate (*Brerewood*).

PATRICIAN. *a. (patricius, Latin.)* Senatorial; noble; not plebeian (*Addison*).

PATRICIAN, a title given, among the an-

ent Romans, to the descendants of the hundred, or, as some will have it, of the two hundred first senators chosen by Romulus; and by him called *patres*, fathers. Romulus established this order after the example of the Athenians; who were divided into two classes, viz. the *εὐπατρίδες*, *patricios*, and *δυναμῖνες*, *populares*. Patricians, therefore, were originally the nobility; in opposition to the plebeians. They were the only persons whom Romulus allowed to aspire to the magistracy; and they exercised all the functions of the priesthood till the year of Rome 495. But the cognizance and character of these ancient families being almost lost and extinguished by a long course of years, and frequent changes in the empire, a new kind of patricians were afterwards set on foot, who had no pretensions from birth, but whose title depended entirely on the emperor's favour. This new patriciate, Zosimus tells us, was erected by Constantine, who conferred the quality on his counsellors, not because they were descended from the ancient fathers of the senate, but because they were the fathers of the republic or of the empire. This dignity in time became the highest of the empire. Justinian calls it *summam dignitatem*.

PATRICIAN DEITIES, *Patricii Dei*, in mythology, were Janus, Saturn, the Genius, Pluto, Bacchus, the Sun, the Moon, and the Earth.

PATRICK (St.), the apostle and tutelar saint of Ireland, born in 377, and died in 460, after having founded the church of Armagh, the metropolitan see of that country. Some works falsely attributed to him were printed at London, in 1656, 8vo.

PATRICK (Peter), born at Thessalonica, under the reign of Justinian, who sent him in 534, as ambassador to Amalasonta, queen of the Goths; and in 550 to Chosroes, king of Persia, to conclude a peace with him. He was rewarded for these services with the office of master of the palace. We have by him the fragment of a work, entitled *The History of Ambassadors*, to be found in the collection of Byzantine historians, in 1648, folio.

PATRICK (Simon), a learned English bishop, born at Gainsborough, in Lincolnshire, in 1626. He was educated at Queen's college, Cambridge, and afterwards became chaplain to sir Walter St. John. He had the rectory of St. Paul's, Covent-garden: where he continued all the time of the plague in 1665. In 1678, he was made dean of Peterborough. During the reign of king James, the dean preached and wrote against the errors of the church of Rome. The year after the revolution he was appointed bishop of Chichester, and employed, with others newly consecrated, to settle the affairs of the church of Ireland. In 1691, he was translated to the see of Ely, in the room of the deprived bishop Turner. He died in 1707, after having published many works, among which his *Paraphrase and Commentaries on the Holy Scriptures*, 3 vols. fol. are most distinguished.

PATRIMONIAL. *a. (patrimonial, Fr.)* Possessed by inheritance (*Temple*).

PATRIMONY. *s.* (*patrimonium*, Latin; *patrimoine*, French.) An estate possessed by inheritance (*Davies*).

PATRIMONY OF ST. PETER, a province of Italy, in the Ecclesiastical State. It is 35 miles long and 30 broad; bounded on the N. by Orvieto, on the E. by Umbria and Sabina, on the S. by Campagna di Roma, and on the S.W. by the sea. Viterbo is the capital.

PATRINGTON, a town in the East riding of Yorkshire, with a market on Saturday. Here the Roman road from the Picts Wall ended. It is seated at the mouth of the Humber, 50 miles S.E. of York, and 191 N. of London. Lon. 0. 8 E. Lat. 53. 49 N.

PATRIOT. *s.* One whose ruling passion is the love of his country (*Tickel*).

PATRIOTISM. *a.* (from *patriot*.) Love of one's country; zeal for one's country.—“Zeal for the public good (says Mr. Addison), is the characteristic of a man of honour, and a gentleman, and must take place of pleasures, profits, and all other private gratifications: that whosoever wants this motive, is an open enemy, or an inglorious neuter to mankind, in proportion to the misapplied advantages with which nature and fortune have blessed him.” This love of our country does not import an attachment to any particular soil, climate, or spot of earth, where perhaps we first drew our breath, though those natural ideas are often associated with the moral ones; and, like external signs or symbols, help to ascertain and bind them; but it imports an affection to that moral system of community, which is governed by the same laws and magistrates, and whose several parts are variously connected one with the other, and all united upon the bottom of a common interest. Wherever this love of our country prevails in its genuine vigour and extent, it swallows up all sordid and selfish regards; it conquers the love of ease, power, pleasure, and wealth; nay, when the amiable partialities of friendship, gratitude, private affection, or regards to a family, come in competition with it, it will teach us to sacrifice all, in order to maintain the rights, and promote and defend the honour and happiness of our country. To pursue therefore our private interests in subordination to the good of our country; to be examples in it of virtue, and obedient to the laws; to choose such representatives as we apprehend to be the best friends to its constitution and liberties; and, if we have the power, to promote such laws as may improve and perfect it; readily to embrace every opportunity for advancing its prosperity; cheerfully to contribute to its defence and support; and, if need be, to die for it:—these are among the duties which every man, who has the happiness to be a member of our free and protestant constitution, owes to his country.

The constitution of man is such, that the most selfish passions, if kept within their proper bounds, have a tendency to promote the public good. There is no passion of more general utility than patriotism; but its origin may unquestionably be termed selfish. The

love of one's relations and friends is the most natural expansion of self-love: this affection connects itself too with local circumstances, and sometimes cannot easily be separated from them. It often varies, as relationship or place varies; but acquires new power when the whole community becomes its object. It was therefore with singular propriety that the poet said, “Self-love and social are the same.”—History furnishes a variety of instances of this exalted virtue, to which individuals of every civilized nation have occasionally aspired. The love of their country, and of the public good, seems to have been the predominant passion of the Spartans. Pedarethus having missed the honour of being chosen one of the three hundred who had a certain rank of distinction in the city, went home extremely pleased and satisfied; saying, “He was overjoyed there were three hundred men in Sparta more honourable than himself.”

For more on this subject, see Dr. Parr's Sermon preached at the parish church of Hatton, and Parsons's True Patriot, preached at Leeds.

PATROCINATE. *v. a.* (*patrocinor*, Lat.) To patronise; to protect; to defend.

PATROCLUS, one of the Grecian chiefs during the Trojan war; son of Menætius, by Sthenela. In consequence of an accidental murder he fled from Opus, where his father reigned, and retired to the court of Peleus king of Phthia, where he was kindly received, and where he contracted the most intimate friendship with Achilles the monarch's son. When the Greeks went to the Trojan war Patroclus also accompanied them, and he embarked with 10 ships from Phthia. He was the constant companion of Achilles, and when his friend refused to appear in the field, Patroclus imitated his example, and by his absence was the cause of the overthrow of many Greeks. But at last Nestor prevailed upon him to return to the war, and Achilles permitted him to appear in his armour. He soon routed the victorious armies of the Trojans, and obliged them to fly within their walls for safety. Apollo, who interested himself for the Trojans, placed himself to oppose him, and Hector, at the instigation of the god, attacked him. The engagement was obstinate, but at last Patroclus was overpowered by the valour of Hector, and the interposition of Apollo. His arms became the property of the conqueror, but his body was recovered and carried to the Grecian camp, where Achilles received it with the greatest lamentations. His funeral was observed with the greatest solemnity. Upon the death of Patroclus Achilles forgot his resentment, and entered the field to avenge the death of his friend. The patronymic of Aetorides is often applied to Patroclus, because Actor was father to Menætius.

PATROL, in war, a round or march made by the guards or watch in the night-time, to observe what passes in the streets, and to secure the peace and tranquillity of a city or camp. The patrol generally consists of a body of five or six men, detached from a body on guard,

and commanded by a serjeant: They go every hour of the night, from the beating of the tattoo until the reveille: they are to walk in the streets in garrisons, and all over the camp in the field, to prevent disorders, or any number of people from assembling together: they are to see the lights in the soldiers barracks put out, and to take up all the soldiers they find out of their quarters. Sometimes patrols consist of an officer and 30 or 40 men, as well infantry as cavalry; but then the enemy is generally near at hand, and consequently the danger greater.

TO PATRO'L. *v. n.* (*patrouiller*, Fr.) To go the rounds in a camp or garrison (*Black.*). 2. To guard a turnpike road, or to clear it of robbers.

PATRON. *s.* (*patronus*, Latin.) 1. One who countenances, supports, or protects (*Prior*). 2. A guardian saint (*Spenser*). 3. Advocate; defender; vindicator (*Locke*). 4. One who has donation of ecclesiastical preferment (*Wesley*).

PAT'RONAGE. *s.* (from *patron*.) 1. Support; protection (*Sidney*). 2. Guardianship of saints (*Addison*). 3. Donation of a benefice; right of conferring a benefice.

TO PA'TRONAGE. *v. a.* (from the noun.) To patronise; to protect (*Shakspeare*).

PATRONAGE (Arms of), in heraldry, are those on the top of which are some marks of subjection and dependance: thus the city of Paris lately bore the fleurs-de-lis in chief, to show her subjection to the king; and the cardinals, on the top of their arms, bear those of the pope, who gave them the hat, to show that they are his creatures.

PATRONAL. *a.* (from *patronus*, Latin.) Protecting; supporting; guarding; defending; doing the office of a patron (*Brown*).

PATRONESS. *s.* (feminine of *patron*.) 1. A female that defends, countenances, or supports (*Fairfax*). 2. A female guardian saint. 3. A woman that has the gift of a benefice.

TO PAT'RONISE. *v. a.* (from *patron*.) To protect; to support; to defend; to countenance (*Bacon*).

PATRONYMIC. *s.* (πατρωνυμικός.) Name expressing the name of the father or ancestor: as, *Tydidēs*, the son of Tydeus (*Broome*).

Patronymics are derived, 1. From the father, as *Pelides*, i. e. *Achilles*, the son of *Peleus*. 2. From the mother, as *Philyrides*, i. e. *Chiron*, the son of *Philyra*. 3. From the grandfather on the father's side, as *Æacides*, i. e. *Achilles*, the grandson of *Æacus*. 4. From the grandfather by the mother's side, as *Atlantiades*, i. e. *Mercury*, the grandson of *Atlas*: and, 5. From kings and founders of nations, as *Romulidæ*, i. e. the Romans, from their founder, king *Romulus*.

PATROS, mentioned by *Jeremiah* and *Ezekiel*, appears from the context to be meant of a part of Egypt. *Bochart* thinks it denotes the Higher Egypt: the Septuagint translate it the country of Pathure: in *Pliny* we have the *Nomos Pathurites* in the Thebais; in *Ptolemy*, *Pathyris*, probably the metropolis. From

the Hebrew appellation *Patros* comes the gentilitious name *Pathrusim*, *Moses*.

PATRU (*Oliver*), a French lawyer, born at Paris, in 1604. He was elected a member of the academy in 1640, on which occasion he made a most elegant oration of thanks, and gave rise to the custom ever after of admisory speeches. He died at Paris, Jan. 16, 1681. Patru was a rigid, though just, censor, inasmuch that, when *Racine* was thought to have made some observations, rather too subtle, upon the works of *Boileau*, the latter, by a parody on the Latin proverb, *ne sis mihi patruus*, replied, *ne sis mihi PATRU*.

PATTEN of a pillar. *s.* Its base (*Answer*).

PATTEN. *s.* (*patin*, French.) A shoe of wood with an iron ring, worn under the common shoe by women, to keep them from the dirt (*Camden*).

PATTENMAKER. *s.* (*patten* and *maker*.) He that makes pattens.

PATTENSEN, a town of Lower Saxony, in the principality of *Calemburg*, formerly surrounded with walls, moats, and ramparts. It is six miles S. of *Hanover*.

PATTEN-SHOE, in farriery, a horse-shoe so called, under which is soldered a sort of half-ball of iron, hollow within. It is designed for hip-shot horses, and put upon a sound foot, to the end that the horse, not being able to stand upon that foot without pain, may be constrained to support himself upon the lame foot, and so counteract the disposition, in the sinews, to contract the haunch.

Many ignorant pretenders, when a horse has been recently lamed in the shoulder, peg the other foot, or set on a patten-shoe to bring the lame shoulder upon a stretch; and some turn them immediately out to grass: but all this, as *Gibson* observes, is very preposterous, and the direct way to render him incurably lame; a patten-shoe being only necessary in old lamenesses, where the muscles have been a long while contracted.

TO PA'TTER. *v. n.* (from *patte*, Fr. the foot.) To make a noise like the quick steps of many feet (*Dryden*).

PATTERN. *s.* (*patron*, French; *patroon*, Dutch.) 1. The original proposed to imitation; the archetype; that which is to be copied; an exemplar (*Rogers*). 2. A specimen; a part shown as a sample of the rest (*Swift*). 3. An instance; an example (*Hooker*). 4. Any thing cut out in paper to direct the cutting of cloth, &c.

TO PA'TTERN. *v. a.* (*patronner*, French.) 1. To make in imitation of something; to copy (*Shakspeare*). 2. To serve as an example to be followed (*Shakspeare*).

PATTI, a town of Sicily, in *Val di Demona*, with a bishop's see, seated on the gulf of Patti, 28 miles W. of *Messina*. Lon. 15. 22 E. Lat. 38. 11 N.

PATTIARY, a town of *Hindustan Proper*, in the country of *Oude*, 55 miles N.W. of *Canogue*, and 55 E.N.E. of *Agra*. Lon. 79. 45 E. Lat. 27. 33 N.

PATTUN, or **PUTTAN**, a town of *Hin-*

dustan Proper, capital of a circar of the same name, in the country of Guzerat. It is 48 miles N. of Amedabad, and 132 S.W. of Oudipour. Lon. 72. 30 E. Lat. 23. 45 N.

PATULCIUS, a surname of Janus, which he received a *pateo*, because the doors of his temple were always open in the time of war. Some suppose that he received it because he presided over gates, or because the year began by the celebration of his festivals.

PAU, a town of France, in the department of the Lower Pyrenees, with a castle where Henry IV. was born. It is seated on an eminence, at the foot of which runs the Gave, 97 miles S. of Bourdeaux. Lon. 0. 4 W. Lat. 43. 15 N.

PAVAN, or **PAVANE**, a grave dance used among the Spaniards, and borrowed from them; wherein the performers made a kind of wheel or tail before each other, like that of *pavo*, a peacock; from whence the name is derived.

PAVANÆ LIGNUM. See **LIGNUM PAVANÆ**.

PAUCILOQUY. *s.* (*pauciloquium*, Lat.) Sparing and rare speech.

PAUCITY. *s.* (*paucitas*, Latin.) 1. Fewness; smallness of number (*Boyle*). 2. Smallness of quantity (*Brown*).

PAUTION (Alexis John Peter), a learned mathematician, born near Lussan in 1732. He distinguished himself by that great work, the *Metrologie*, which was a collection of the measures of all countries, and was first published in 1780. He was assisted, in the foreign department, by the astronomer Lalande. In this excellent production are introduced, Observations and Calculations on the ancient Measures, with Dissertations on Population, Agriculture, &c. He was also the author of *An Essay on the Screw of Archimedes*; and *A Theory of the Laws of Nature*, published in 1781, in which he attempts to refute the systems of Newton and Nollet. He died in 1799.

To PAVE. *v. a.* (*pavio*, Latin.) 1. To lay with brick or stone; to floor with stone (*Shakspeare*). 2. To make a passage easy (*Bacon*).

PAVEMENT, a layer of stone, or other matter, serving to cover and strengthen the ground of divers places for the more commodious walking on. In London the pavement for coach-ways is chiefly a kind of granite from Scotland: and on the footpath Yorkshire paving is used; courts, stables, kitchens, halls, churches, &c. are paved usually with tiles, bricks, flags, or fire-stones; and sometimes with a kind of free-stone and rag-stone. In France, the public roads, streets, courts, &c. are paved with gres, a kind of free-stone. In Venice, the streets, &c. are paved with brick; churches sometimes with marble, and sometimes with Mosaic work. In Amsterdam, and the chief cities of Holland, they call their brick pavement the burgomaster's pavement, to distinguish it from the stone or flint pavement, which is usually in the middle of the street, serving for the passage of their horses, carts,

coaches, and other carriages; the brick borders being designed for the passage of people on foot. Pavements of free-stone, flints, and flags, in streets, &c. are laid dry, that is, are retained in a bed of sand; those of courts, stables, ground-rooms, &c. are laid in mortar of lime and sand, or in lime and cement, especially if there be vaults or cellars underneath. Some masons, after laying a floor dry, especially of brick, spread a thin mortar over it, sweeping it backwards and forwards, to fill up the joints. Thirty-two statute bricks laid flat, pave a yard square; sixty-four edgewise. The square tiles used in paving, called paving bricks, are of various sizes, from six to twelve inches square. Pavements of churches, &c. frequently consist of stones of different colours, chiefly black and white, and of several forms, but chiefly square and lozenges, artfully disposed.

PAVEMENT OF TERRACE, is that which serves for the covering of a platform, whether it be over a vault, or on a wooden floor. Those over vaults are usually stones squared, and bedded in lead. Those on wood are either stones with beds, for bridges; tiles for ceilings in rooms; or layers of mortar made of cement and lime, with flints or bricks laid flat, as is still practised by people in the east and south, on the tops of their houses.

PAVETTA, in botany, a genus of the class tetrandria, order monogynia. Corol one-petalled, funnel-form, superior; stigma curved, berry two-seeded. Seven species, trees or shrubs of China or India.

PAVIA, a fortified town of Italy, in the duchy of Milan, with a celebrated university, and a bishop's see. In the centre of the town is a castle, where the ancient dukes of Milan resided. It has been often taken and retaken, the last time by the Austrians in 1746. It is seated on the Tesno, over which is a bridge, 15 miles S. of Milan. Lon. 9. 15 E. Lat. 45. 13 N.

PAVIER, or **PAVER**, one who paves or lays with stones.

PAVILION, in architecture, signifies a kind of turret or building, usually insulated, and contained under a single roof; sometimes square, and sometimes in form of a dome: thus called from the resemblance of its roof to a tent. Pavilions are sometimes also projecting pieces, in the front of a building, marking the middle thereof; sometimes the pavilion flanks a corner, in which case it is called an angular pavilion. The Louvre is flanked with four pavilions; the pavilions are usually higher than the rest of the building. There are pavilions built in gardens, commonly called summer-houses, pleasure-houses, &c. Some castles or forts consist only of a single pavilion.

PAVILION, in military affairs, signifies a tent raised on posts, to lodge under in the summer time.

PAVILION, is also sometimes applied to flags, colours, ensigns, standards, banners, &c.

PAVILION, in heraldry, denotes a covering in form of a tent, which invests or wraps up

the armories of divers kings and sovereigns, depending only on God and their sword. The pavilion consists of two parts; the top, which is the chapeau, or coronet; and the curtain, which makes the mantle. None but sovereign monarchs, according to the French heralds, may bear the pavilion entire, and in all its parts. Those who are elective, or have any dependence, say the heralds, must take off the head, and retain nothing but the curtains.

PAVILIONS, among jewellers, the undersides and corners of the brilliants, lying between the girdle and the collet.

To PAVILION. *v. a.* (from the noun.) 1. To furnish with tents (*Milton*). 2. To be sheltered by a tent.

PAUL, formerly named SAUL, was of the tribe of Benjamin, a native of Tarsus in Cilicia, a Pharisee by profession: first a persecutor of the church, and afterwards a disciple of Jesus Christ, and apostle to the Gentiles. It is thought he was born about two years before our Saviour, supposing that he lived 68 years, as we read in a homily which is in the sixth volume of St. Chrysostom's works. He was a Roman citizen (*Acts* xxii. 27, 28.), because Augustus had given the freedom of the city to all the freemen of Tarsus, in consideration of their firm adherence to his interests. His parents sent him early to Jerusalem, where he studied the law at the feet of Gamaliel, a famous doctor (*id.* xxiii. 3.). He made very great progress in his studies, and his life was always blameless before men; being very zealous for the whole observation of the law of Moses (*id.* xxvi. 4, 5.). But his zeal carried him too far; he persecuted the church, and insulted Jesus Christ in his members (*1 Tim.* i. 13.); and when the protomartyr St. Stephen was stoned, Saul was not only consenting to his death, but he even stood by and took care of the clothes of those that stoned him (*Acts* vii. 58, 59.). This happened in the 33d year of the common era, some time after our Saviour's death. The holy scriptures give the detail of St. Paul's conversion and subsequent proceedings very fully. As an orator he appears to have been very distinguished, Longinus himself having spoken of him in terms of approbation. Some very eloquent addresses of his are preserved in the *Acts* of the Apostles; and out of the twenty-seven inspired books of the New Testament, fourteen were written by Paul. Lord Lyttleton has a very valuable tract, in which the arguments for the truth of Christianity resulting from the conversion of St. Paul are very forcibly stated.

PAUL (Mark), or MARCO PAULO, a Venetian traveller. He penetrated, 1272, as far as the capital of Cublai Chan, of which he published an interesting account. Some authors imagine that Cambalus which he mentions is the town of Pekin. He makes no mention of the great wall of China.

PAUL I; pope after Stephen II. 757, died 10 years after.

PAUL II. (Peter Barbo), pope after Pius II. 1464, permitted the cardinals to wear a purple

habit, and the red cap of silk, and the mitre which hitherto had distinguished the sovereign pontiff. He died 1471, aged 54.

PAUL III. (Alexander Farnese), was pope after Clement VII. 1534. In his time began the famous council of Trent, whose first sitting was in 1545. He made a treaty with the Venetians and the emperor against the Turks, and pursued measures of severity against Henry VIII. He was respectable in private life, and at all times anxious to procure concord among the Christian princes. He died 1549, aged 82.

PAUL IV. (John Peter Caraffa), succeeded Marcellus II. 1555, aged near 80. He behaved with great haughtiness, and threatened with his severest displeasure Charles V. because he did not oppose sufficiently vigorous measures against the protestants; and when Elizabeth announced to him her accession, he complained that she had ascended the throne without the concurrence of the holy see, on which all the crowns of Europe were dependent. He died unlamented, 1559.

PAUL V. (Camillus Borghese), was pope after Leo XI. 1605. He was engaged in a dispute with the Venetians, and deserved the gratitude of the Romans for the various embellishments which he introduced, the collections of paintings, sculpture, &c. which he made, and the erection of public fountains and aqueducts. He died 1621, aged 69.

PAUL (Petrowitz), emperor of Russia, son of the great Catherine, was born 1754. He married, 1774, the daughter of the landgrave of Hesse Darmstadt, who died two years after, and for his second wife he took a princess of Wirtemberg, niece to the king of Prussia. He travelled in 1780, and during 14 months visited Poland, Austria, Italy, France, and Holland. On the death of his mother in 1796, he ascended the throne, and took an active part in the general confederacy of Europe, against France. He sent Suwarrow into Italy, where victory followed his steps, and he attacked the northern frontiers of France, in conjunction with the English; but all at once he was reconciled to his enemies, and seizing the property of the English, he banished their unhappy sailors to Siberia. This extravagance was stopped by sudden death. The unfortunate Paul was assassinated in April, 1801, by some of his discontented nobles. The cause of his extraordinary change of politics has been ascribed to the influence of a beautiful mistress, who was sent by the cabinet of Paris to second the labours of diplomatic intrigue. (*Lempriere*).

PAUL'S BETONY. See VERONICA.

PAULA, a Roman lady, born in 347, and descended from the Scipios and the Gracchi. She added to the brightest qualities of the mind, the virtues of Christianity. She founded a monastery at Bethlehem, where she practised the most rigid austerities. She was well versed in the Hebrew scriptures, and was the intimate friend of St. Jerome. She died in 407.

PAULI (Simon), physician to the king of

Denmark. He was the author of the *Flora Danica*, and of a treatise on the Use and Abuse of Tobacco and Tea. He died in 1682, aged 77.

PAULIANISTS, PAULIANISTÆ, a sect of heretics, so called from their founder Paulus Samosatenus, a native of Samosata, elected bishop of Antioch in 262. His doctrine seems to have amounted to this: that the Son and the Holy Ghost exist in God in the same manner as the faculties of reason and activity do in man; that Christ was born a mere man; but that the reason or wisdom of the Father descended into him, and by him wrought miracles upon earth, and instructed the nations; and finally, that on account of this union of the Divine word with the man Jesus, Christ might, though improperly, be called God. It is also said, that he did not baptize in the name of the Father and of the Son, &c.; for which reason the council of Nice ordered those baptized by him to be re-baptized.

Being condemned by Dionysius Alexandrinus in a council, he abjured his errors, to avoid deposition; but soon after he resumed them, and was actually deposed by another council in 269. He may be considered as the father of the modern Socinians; and his errors are severely condemned by the council of Nice, whose creed differs a little from that now used, under the same name, in the church of England. The creed agreed upon by the Nicene fathers, with a view to the errors of Paulus Samosatenus, concludes thus: *τοὺς δὲ λεγούσας ἢ πρὸς οὐκ ἔστιν, καὶ πρὶν γεννηθῆναι, οὐκ ἦν, &c. τοὺς αὐθεματίζει ἡ καθολικὴ καὶ ἀποστολικὴ ἐκκλησία.*—"But those who say he was when he was not, and was not before he was born, the catholic and apostolic church anathematizes." To those who have any veneration for the council of Nice, this must appear a very severe, and perhaps not unjust, censure of the modern Hutchinsonians as well as of the Socinians.

PAULICIANS, a branch of the ancient Manichees, so called from their chieftain, one Paulus, an Armenian, in the seventh century: who with his brother John, both of Samosata, formed this sect; though others are of opinion, that they were thus called from another Paul, an Armenian by birth, who lived under the reign of Justinian II. A certain zealot, called Constantine, revived, in the seventh century, under the government of Constantine, this drooping faction, which had suffered much from the violence of its adversaries, and was ready to expire under the severity of the imperial edicts, and of those penal laws which were executed against its adherents with the utmost rigour. However, the Paulicians, by their number, and the countenance of the emperor Nicephorus, became formidable to all the East.

But the cruel rage of persecution, which had for some years been suspended, broke forth with redoubled violence under the reigns of Michael Curopalates, and Leo the Armenian,

who inflicted capital punishment on such of the Paulicians as refused to return into the bosom of the church.

The empress Theodora, tutress of the emperor Michael, in 845, would oblige them either to be converted, or to quit the empire: upon which, several of them were put to death, and more retired among the Saracens; but they were not all exterminated.

The first religious assembly the Paulicians had formed in Europe is said to have been discovered at Orleans, in 1017, under the reign of Robert; many of whom were condemned to be burnt alive. The ancient Paulicians, according to Photius, expressed the utmost abhorrence of Manes and his doctrine. The Greek writers comprise their errors under the six following particulars. 1. They denied that this inferior and visible world is the production of the supreme Being, and they distinguish the Creator of this world, and of human bodies from the most high God, who dwells in the heavens; and hence some have been led to conceive, that they were a branch of the Gnostics rather than of the Manichæans. 2. They treated contemptuously the virgin Mary, or, according to the usual manner of speaking among the Greeks, they refused to adore and worship her. 3. They refused to celebrate the institution of the Lord's Supper. 4. They loaded the cross of Christ with contempt and reproach; by which we are only to understand, that they refused to follow the absurd and superstitious practice of the Greeks, who paid to the pretended wood of the cross a certain sort of religious homage. 5. They rejected, after the example of the greatest part of the Gnostics, the books of the Old Testament, and looked upon the writers of that sacred history as inspired by the Creator of this world, and not by the supreme God. 6. They excluded presbyters and elders from all part in the administration of the church.—Mosheim's *Eccl. Hist.* vol. ii. p. 178. 8vo.

PAULINA, the wife of the philosopher Seneca, who attempted to kill herself, when Nero had ordered her husband to die. The emperor however prevented her, and she lived some few years after in the greatest melancholy.

PAULINIA, in botany, a genus of the class octandria, order trigynia. Calyx five-leaved; petals four; nectary four-leaved, unequal; capsule turbinate, triangular, three-celled, the cells one-seeded. Fourteen species; natives of the West Indies and South America.

PAULINUS, a bishop who flourished in the early part of the 7th century. He was the apostle of Yorkshire, having been the first archbishop of York. This dignity seems to have been conferred on him about the year 626. He built a church at Almonbury, and dedicated it to St. Alban, where he preached to and converted the Brigantes. Camden mentions a cross at Dewsborough, which had been erected to him with this inscription, *Paulinus*

hic predicavit et celebravit. York was so small about this time, that there was not so much as a small church in it in which king Edwin could be baptized. Constantius is said to have made it a bishopric. Pope Honorius made it a metropolitan see. We are told that Paulinus baptized in the river Swale, in one day, 10,000 men, besides women and children, on the first conversion of the Saxons to Christianity, besides many at Halystone. At Walstone in Northumberland, he baptized Sebert king of the East Saxons. Bede says, "Paulinus coming with the king and queen to the royal manor called Ad-Gebrin (now Yeverin), staid there 36 days with them, employed in the duties of catechizing and baptizing. In all this time he did nothing from morning to night but instruct the people, who flocked to him from all the villages and places, in the doctrine of Christ and salvation; and, after they were instructed, baptizing them in the neighbouring river Glen." According to the same Bede, "he preached the word in the province of Lindissi; and first converted the governor of the city of Lindocollina, whose name was Blecca, with all his family. In this city he built a stone church of exquisite workmanship, whose roof being ruined by long neglect or the violence of the enemy, only the walls are now standing." He is also said to have founded a collegiate church of prebends near Southwell, in Nottinghamshire, dedicated to the Virgin Mary. This church he is said to have built when he baptized the Coritani in the Trent.

Assuming the correctness of the above account, which is taken verbatim from the *Encyclopædia Britannica*, it seems pretty obvious (and it is curious as a matter of fact), that the first archbishop of York baptized men, women, and children, by immersion.

PAULUS ÆMYLIUS, a Roman celebrated for his victories, and surnamed Macedonicus from his conquest of Macedonia. In the early part of life he distinguished himself by his fondness for military discipline. In his first consulship his arms were directed against the Ligurians, whom he totally subjected. When Perseus, king of Macedonia, declared war against Rome, he was again appointed consul in the 60th year of his age, and in a general engagement near Pydna obtained a complete victory. In two days the conqueror made himself master of all Macedonia, and soon after the fugitive monarch was brought into his presence. Paulus did not exult over his fallen enemy. When he had finally settled the government of Macedonia with ten commissioners from Rome, and after he had sacked 70 cities of Epirus, and divided the booty amongst his soldiers, Paulus returned to Rome, where Perseus with his wretched family adorned the triumph of the conqueror. The riches which the Romans derived from this conquest were immense, and the people were freed from all taxes till the consulship of Hirtius and Pansa; but the conqueror himself

was poor, having appropriated for his own use nothing of the treasures except the library of Perseus. He died about 168 years B. C. universally regretted by all the Romans.

PAUNCH. *s.* (*panse*, French; *pantex*, Latin.) The belly; the region of the guts (*Bacon*).

To PAUNCH. *v. a.* (from the noun.) To pierce or rip the belly; to eviscerate; to take out the paunch; to eviscerate (*Garth*).

PAVO. Peacock. In zoology, a genus of the class aves, order gallinæ. Bill convex, robust; head covered with revolute feathers; nostrils large; feathers of the rump long, broad, expansile, and covered with eye-like spots. Four species.

1. *P. cristatus*. Crested peacock. Head with a compressed crest; spurs solitary. Two other varieties.

♂ Cheeks, throat, belly, and wing coverts white.

♀ Body entirely white.

If empire were obtained by beauty, and not by force, the crested peacock, without dispute, would be the king of birds. There is none of the feathered offspring, upon which nature has heaped her treasures with such boundless profusion. Of a tall stature, majestic step, and elegant proportions, every thing belonging to this bird seems to announce a creature of importance and distinction. It is crowned with a fine moveable crest, of the richest hue, which adorns and heightens, without burdening its head. The plumage and tail of this magnificent bird are adorned with colours so rich and various, that no human art can imitate, nor language describe them. When it struts in the sunshine, every moment produces a thousand shades of undulating and evanescent colours, that are continually replaced by other shades, always different, and always admirably beautiful.

But this brilliant plumage, which exceeds the lustre of the finest flowers, fades, like them, every year, and drops in the moulting season; when the poor bird, as if afflicted on account of his loss, and afraid to be seen in so humiliating a condition, always seeks to conceal himself in some gloomy retreat, till the return of spring again restores him his splendid dress. At that season he resumes his station in the open field, to receive the homage due to his beauty; for it is alleged, that nothing so much gratifies his pride as the admiration of his gaudy apparel.

Peacocks, though spread over the greatest part of Europe, came originally from India; where they are found in vast flocks, in some parts of the hither peninsula and the islands of the Indian ocean. So early as the days of Solomon, they were imported into Judea, by the fleets which that monarch equipped upon the Red Sea; and which, in all probability, traded to the coast of Malabar.

Ælian relates, that they were brought into Greece by the barbarians (by whom he means the Asiatics), where they were at first so rare,

that for thirty years after their arrival, they were exhibited at Athens as a show to strangers; and he adds, that multitudes flocked to see them from Lacedemon and Thessaly, who were, each for a certain sum, admitted to the spectacle. This was after the time of Alexander; for that conqueror, though well acquainted with Greece, had never seen them till he marched into India, where he found them flying wild on the banks of the river Hyarotis, and was so struck with their beauty, that he decreed a severe punishment on all who killed or disturbed them. Towards the latter end of his reign they had so greatly multiplied in Greece, that Aristotle, who survived his pupil only two years, speaks of them as birds well known to his countrymen.

The peacock tribe being thus introduced from Asia into Greece, soon spread over the rest of Europe. They have even been carried as far north as Sweden; but in those cold countries they are produced only in small numbers, reared with difficulty, and not without considerable diminution of their beauty. From the great intercourse of the Europeans with America, they are now introduced into almost every part of the new world.

At first the Europeans established them upon the coast of Africa, where they are now domesticated by the princes of those countries, particularly of Congo and Angola. They have been long since transported into Mexico, Peru, and the West India islands, where they never could have appeared but from the aid of man: because, according to a general law of nature, all quadrupeds, and birds of heavy flight, peculiar to the warm climates, cannot, without human assistance, escape from one continent to the other. The short wings, heavy bodies, and embarrassing tail of the peacock, must have for ever debarr'd him from attempting to fly over such an extent of sea.

When the peacock was first brought into Greece, it was only to gratify the eye with the sight of its plumage. The Romans, however, who were richer, and carried by consequence every excess of luxury to a greater length, soon served them up as one of their most delicate dishes. Hortensius, the orator, is said to have first made the peacock an article of food. His example was soon followed by the epicures in Rome, insomuch that the price paid for these birds soon became exorbitant. The luxurious and effeminate emperors that succeeded, refining upon the luxury of former times, took a pride in collecting immense dishes of the heads or brains of peacocks; dainties which had nothing to recommend them but the prodigious expence at which they were provided. The same thing may be said of their flesh, which is hard and dry. But probably the Roman cookery, which was carried to a very high degree of perfection, might compensate for these defects. Only the young at present are deemed good eating: the old are seldom dressed, except at some formal and splendid feast. In France, they were formerly served up with all their plumage, merely for show; a

purpose for which they are perfectly suited, as their flesh is said to remain unaffected by corruption for a longer period than that of most birds.

It is not till the third year that the males are at their full size and vigour. Then their feathers are all in perfection; and the superfluous nourishment, having nothing farther to add to the individual, is employed in reproducing the species. The female, soon after fecundation, lays her eggs in some retreat where she may be concealed from the male, who would destroy them were he to discover her charge. In these northerly climates she lays only from four to five eggs; but in Greece, according to Aristotle, she produced twelve, and in India sometimes lays twice that number, so powerfully does climate operate upon the fertility of birds of this, and perhaps of every genus. In these countries also, the female, when deprived of the male, will produce barren eggs, which by the ancients were denominated zephyrian, as supposing them to be the result of the warm stimulus of the vernal gales.

The young, when excluded, are fed with crumbs of bread, cheese, and grass. The ancients paid very particular attention to the rearing of these birds: they put each of the young ones into a separate cage, to prevent them from fighting. The male does not recognize the young for his own till after they have got the crest; before that time he chases them like strangers.

The peacock, like all other birds of the poultry kind, feeds upon grain; but it is extremely capricious, and there is hardly any kind of food which it will not, at times, covet and pursue. Insects and tender plants are often eagerly sought for, at a time when it has a sufficiency of its natural food at hand. In the indulgence of these irregular appetites, walls cannot easily confine it. It strips the tops of houses of their tiles and thatch; it lays waste the labours of the gardener; roots up his choicest seeds; and nips his favourite flowers in the bud. Thus, its beauty but ill compensates for the mischief it occasions; and many of the more homely looking fowls are very deservedly preferred to it.

The cry of the peacock, which is harsh and disagreeable, is rendered still more intolerable, by the time in which it is most frequently uttered. It perches upon the house tops, and, in the dead of night, often interrupts the repose of other animals by those hideous screams, from which Varro alleges it derived its Latin name. (*Volucres pleræque a suis vocibus appellatæ; ut hæ, upupa, cuculus, ulula, pavo. De lingua Latina, Lib. iv.*) According to Ælian's account, adopted by Willoughby, the peacock lives no less a period than an hundred years. Aristotle and Pliny, however, assign it the more moderate space of twenty-five, a longevity which accurate observations would probably confirm.

As it is only in India that these birds are found in their natural freedom; so it is there

also that the inhabitants have invented a method of hunting them. Although they are spread in vast flocks over the fields, there is no possibility of approaching them by day, so quickly do they penetrate the thickets, where they cannot be pursued. In the kingdom of Cambaya, where this diversion is practised, the fowler observes the trees upon which they perch; and in the night approaches them with a kind of banner, upon each side of which a peacock is painted to the life. A lighted torch is placed upon the top of this decoy; and the peacock, when disturbed, flies to what it takes for another bird of its kind, and is caught in a noose placed there for that purpose.

Of the origin of the white varieties of this species we are ignorant. The hare and the ermine become in some countries white from the coldness of the climate, but resume their natural colour when transported into a warmer latitude. This fact however does not hold with respect to the white peacock, for it produces a constant race of the same colour; and its eggs, though transported into the most sultry climes, will yield birds of the parent hue.

This whiteness of plumage has justly been deemed by naturalists the effect of migration. Norway, and the other countries of the north, have given birth to this species, for there they are found wild; and from these frozen regions they annually retire to spend the winter in Germany. Whether this species was introduced into the north of Europe by a voluntary migration from Asia, or by the intervention of man, is a point which cannot now be determined. It is probable that it was wholly unknown to the ancients, since no mention is made of it in any of their writings; and it is to be presumed also, that its migration into the north is not very ancient, for, though now common there, it was deemed extremely rare by all former naturalists.

The feathers of these varieties, though white, still retain some shades of their primitive lustre. Those of the tail, particularly, show some faint traces of that beautiful eye, which sparkles at the end of each feather in the common variegated species. It is probable, that were this bird removed into the milder regions of Asia, its original colours would return in a few generations.

2. *P. bicalcaratus*. Iris peacock. Brown; head subcrested; spurs two. Bill blackish, the upper mandible from the nostrils to the tip red; irides yellow; crown black; face naked; temples white; neck shining brown with black lines; upper part of the back, shoulders, and wing coverts brown, with yellowish stripes, the feathers near the tip with a large purple-gold spot; lower part of the back and rump spotted with white; body beneath brown, with transverse black streaks; quill-feathers dusky; legs brown. Inhabits China: rather larger than the pheasant.

3. *P. Thibetanus*. Thibet peacock. Cinereous streaked with blackish; head subcrested; spurs two; wing-coverts, back, and

rump, grey, with small white spots, besides which the coverts have shining blue spots. Inhabits Thibet; twenty-five and a half inches long.

4. *P. muticus*. Japan peacock. Head with a subulate crest; spurless; body blue mixed with green; head and neck greenish, with blue spots, and a white streak down the middle. Inhabits Japan: size that of *P. cristatus*.

PAVO, in astronomy, a constellation of the southern hemisphere, unknown to the ancients, and not visible in our latitudes. It consists of 14 stars, which, arranged according to their magnitudes, are 0, 1, 3, 5, 4, 1.

PAVONIA, in botany, a genus of the class monadelphia, order polyandria. Calyx double, the outermost many-leaved; stigmas ten; capsules five, two-valved, one-seeded. Fifteen species; natives of the Indies; and several of them formerly, but erroneously, ranged under the genus *hibiscus*, as some few were under that of *urena*.

PAVOR, an emotion of the mind which received divine honours among the Romans. Tullus Hostilius, the third king of Rome, was the first who built her temples, and raised altars to her honour, as also to Pallor, the goddess of paleness.

PAUPER. *s.* (Latin.) A poor person; one who receives alms.

PAUSANIAS. There were many of this name, the most remarkable of whom are the following: 1. A Spartan general, who greatly signalized himself at the battle of Platæa, against the Persians. He was afterwards set at the head of the Spartan armies, and extended his conquests in Asia, but his haughtiness created him many enemies. Pausanias was dissatisfied with his countrymen, and he offered to betray Greece to the Persians, if he received in marriage, as the reward of his perfidy, the daughter of their monarch. His intrigues were discovered by means of a youth intrusted with his letters to Persia. The letters were given to the ephori of Sparta, and the perfidy of Pausanias laid open. He fled for safety to a temple of Minerva, which was surrounded with heaps of stones, the first of which was carried there by his own mother. He was starved to death in the temple, and died about 471 years before the Christian era.—2. Another at the court of king Philip of Macedon, who stabbed Philip as he entered a public theatre. After this bloody action, he attempted to make his escape, but was pursued by Aitalus and Perdicas, friends of Philip, who fell upon him, and immediately dispatched him: Some suppose that Pausanias committed this murder at the instigation of Olympias, the wife of Philip, and of her son Alexander.—3. A celebrated orator and historian, who settled at Rome A. D. 170, where he died in a very advanced age. He wrote an history of Greece in ten books, in the Ionic dialect, in which he gives with great precision and geographical knowledge an account of the situation of its different cities; their antiquities, and the several curiosities which they contained. He has

also interwoven mythology, in his historical account, and introduced many fabulous traditions and superstitious stories.—4. There was another Pausanias, a native of Cæsaræa, in Cappadocia, who wrote some declamations, and who is often confounded with the historian of that name.

PAUSE. *s.* (*pausa*, low Latin; *παυω*.) 1. A stop; a place or time of intermission (*Addison*). 2. Suspense; doubt (*Shakspeare*). 3. Break; paragraph; apparent separation of the parts of a discourse (*Locke*). 4. Place of suspending the voice marked in writing, thus —.

PAUSES or **RESTS**, in speaking or reading, are a total cessation of the voice, during a perceptible, and in many cases a measurable space of time. There are two kinds of pauses; first, emphatical pauses; and next, such as mark the distinctions of sense. See **READING**.

PAUSE, in music, a mark, or character, consisting of a curve drawn over a dot, and signifying that the note, or the rest, over which it is placed, is to be continued beyond the regular time. The exact length of the pause is not dictated by any stated rule, but left to the judgment, taste, and feeling of the performer, who sometimes is licensed by the words *ad libitum* to introduce extempore embellishments. See **MUSIC**.

To PAUSE. *v. n.* 1. To wait; to stop; not to proceed; to forbear for a time (*Milton*). 2. To deliberate (*Knolles*). 3. To be intermitted (*Tickel*).

PAUSER. *s.* (from *pause*.) He who pauses; he who deliberates (*Shakspeare*).

PAUSIAS, a painter of Sicily, who lived about 350 years B.C. He was the first who understood how to apply colours to wood or ivory, by means of fire. He made a beautiful painting of his mistress Glycere, which was bought by Lucullus for two talents.

PAUSUS. In zoology, a genus of the class insecta, order coleoptera. Antennas two-jointed; the upper joint very large, inflected, hooked, pedicellate; head pointing forwards with a convex jugular triangle; thorax narrow, unequal, scutellate; shells flexile, deflected, truncate; fore-feet placed at the fore-part of the breast; thighs with minute appendages, tarsi four-jointed. Five species, all exotics: the following are chiefly entitled to notice.

1. *P. sphærocerus*. Head horned; club globular; shells shorter than the abdomen, punctured; shanks dilated at the tip: body polished, chesnut; thorax the same breadth as the head: wings shining, of changeable violet. It inhabits Sierra Leona; wanders about in the night during the months of January and February, and becomes blind or benumbed on the approach of light: the globes of the antennas give a kind of phosphoric light in the dark.

2. *P. microcephalus*. Head unarmed; body an oblong sphere, dark chesnut-brown; shells as long as the body, not punctured; shanks linear; shield two-parted; pivots of the antennas black, upper joint of the club

much larger than the head; wings sooty. Inhabits the Bananas and neighbouring islands.

PAW. *s.* (*pawen*, Welsh; *patte*, French.) 1. The foot of a beast of prey (*More*). 2. Hand: in contempt (*Dryden*).

To PAW. *v. n.* (from the noun.) To draw the forefoot along the ground (*Pope*).

To PAW. *v. a.* 1. To strike with a drawn stroke of the fore-foot (*Tickel*). 2. To handle roughly. 3. To fawn; to flatter (*Ainsworth*).

To PAW THE GROUND. A horse is said to paw the ground, when his leg being either tired or painful, he does not rest it upon the ground. Spirited horses are also said to paw the ground when they shew an impatience to go on by throwing out one of the fore feet repeatedly.

PAWED. *a.* (from *paw*.) 1. Having paws. 2. Broad-footed.

PAWLE, in a ship, a small piece of iron bolted to one end of the beams of the deck, close to the capstan; but yet so easily, as that it can turn about. Its use is, to stop the capstan from turning back, by being made to catch hold of the whelps: they therefore say, heave a pawle; that is, heave a little more, for the pawle to get hold of the whelps; and this they call pawling the capstan.

PAWN. *s.* (*pand*, Dutch; *pan*, French.) 1. Something given to pledge as a security for money borrowed or promise made (*Howel*). 2. The state of being pledged (*Shakspeare*). 3. A common man at chess (*Cowley*).

PAWN, a pledge lodged for the security of the payment of a sum of money borrowed. As the party that pawns the goods has a general property therein, they cannot be forfeited by the person that has them in pawn, for any offence of his: neither can they be taken in execution for his debt: on the other hand, where goods are repawned for money, if after judgment is obtained against the pawnor for debt, the goods in the pawnee's hands are not liable to execution until such time as the money lent is paid to the pawnee. He that borrows money on a pawn is to have again the pledge, when he repays the same, or he may bring an action for detaining it; and his very tender of the money revests the special property in him. Likewise it has been held, that where a broker refuses, on tendering the money, to redeliver the goods, he thereupon shall be indicted. In case goods are pawned for lent money, and no day fixed for their redemption, they are said to be redeemable at any time during the pawnor's life; and though they may not be redeemed after his death, they may after the death of the pawnee. Where the pawn is redeemable on a certain day, it must be strictly observed, or upon failure of payment it may be sold. Also it is the common practice of the brokers, when no day is fixed for redemption, not to stay longer than a year for their money, at the expiration of which time they usually sell the goods. See also 39 and 40 Geo. III. c. 99.

To PAWN. *v. a.* (from the noun.) To pledge; to give in pledge (*Shakspeare*).

PA'WNBROKER. *s.* (*pawn and broker.*) One who lends money upon pledge (*Arbutnot*).

PAX, an allegorical divinity among the ancients. The Athenians raised her a statue, representing her as holding Plutus, the god of wealth, in her lap, to intimate that peace gives rise to opulence. She was represented among the Romans with the horn of plenty; and also carrying an olive branch in her hand. The emperor Vespasian built her a celebrated temple at Rome, which was consumed by fire in the reign of Commodus.

PAXU, an island in the Mediterranean sea, a little to the S. of that of Corfu, about 15 miles in circumference. It is part of the republic of Seven Islands, and produces wine, oil, and almonds. San Nicolo is the only town, and has a good harbour. Lon. 20. 0 E. Lat. 39. 12 N.

To PAY. *v. a.* (*paier*, French.) 1. To discharge a debt (*Dryden*). 2. To dismiss one to whom any thing is due with his money: as, *he had paid his labourers*. 3. To atone; to make amends by suffering (*Roscommon*). 4. To beat (*Shakspeare*). 5. To reward; to recompense (*Dryden*). 6. To give the equivalent for any thing bought (*Locke*).

PAY. *s.* (from the verb.) Wages; hire; money given in return for service (*Temple*).

PAY'ABLE. *a.* (*païable*, French.) 1. Due; to be paid (*Bacon*). 2. Such as there is power to pay (*South*).

PAY'DAY. *s.* (*pay* and *day*.) Day on which debts are to be discharged, or wages paid.

PAY'ER. *s.* (*paieur*, French.) One that pays.

PAYMASTER. *s.* (*pay* and *master*.) One who is to pay; one from whom wages or reward is received (*Taylor*).

PAYMENT. *s.* (from *pay*.) 1. The act of paying (*Bacon*). 2. The thing given in discharge of debt or promise (*Bacon*). 3. A reward (*South*). 4. Chastisement; sound beating (*Ainsworth*).

PAYS (*René le*), a French poet, controller of the imposts of Dauphiné and Provence, was the favourite of the ladies, by his miscellanies, called *amitiés, amours, & amourettes*, published 1685. He died 1690. He wrote besides *Zelotide*, a romance, colloquies, sonnets, &c.

PAYS DE VAUD, a new canton of Switzerland, extending along the lake of Geneva, and rising gradually from the edge of that lake. It is richly laid out in vineyards, corn-fields, and meadows, and chequered with many villages and towns. Lausanne is the capital.

To PAYSE. *v. n.* (used by *Spenser* for *poize*.) To balance.

PAY'SER. *s.* (for *poizer*.) One that weighs (*Carew*).

PAZ, a city of Peru, capital of a province of its name, in the audience of Charcos, and an archbishop's see. Beside the cathedral, it contains four churches, an hospital, a college,

and several convents. It is seated at the foot of a mountain, in a valley abounding in wine and fruits, 220 miles N.W. of Plata. Lon. 68. 50 W. Lat. 17. 0 S.

PAZZI (James), a banker of Florence. He headed the faction which opposed the Medicis, and conspired to cut off the two brothers, Julian and Laurent, and to seize upon the sovereign power. The elevation of the host, 1478, was the signal for this murderous action, and at the moment of this solemn ceremony, Julian was stabbed to the heart by a brother of Pazzi; but Laurent escaped with a slight wound. The popularity of the Medicis, and the atrocity of the deed, armed the people in their favour, and the conspirators were seized, and punished with death. The house of the Pazzis was afterwards allied to the Medicis by marriage.

PEA (Wood). See **OROBUS**.

PEACE. *s.* (*paix*, French; *pax*, Latin.) 1. Respite from war (*Addison*). 2. Quiet from suits or disturbances (*Davies*). 3. Rest from any commotion. 4. Stillness from riots or tumults (*Shakspeare*). 5. Reconciliation of differences (*Isaiah*). 6. A state not hostile (*Ba.*). 7. Rest; quiet; content; freedom from terror; heavenly rest (*Tillotson*). 8. Silence; suppression of the thoughts (*Dryden*).

PEACE, in law, signifies a quiet and harmless behaviour towards the king and his people. The king, by his office and dignity royal, is the principal conservator of the peace within all his dominions, and may give authority to any other to see the peace kept, and to punish such as break it: hence it is usually called the king's peace. All the great officers of state are generally conservators of the peace throughout the kingdom, and may commit all breakers of it, or bind them in recognizance to keep it. Also the sheriff, coroner, constables, and tithingmen are conservators of the peace within their own jurisdiction; and may apprehend all breakers of the peace, and commit them till they find sureties to keep the peace. 1 Black. 350.

PEACE (Justices of the), are persons appointed by the king's commission to attend to the peace of the county where they dwell. They were called guardians of the peace till the 36th year of Edw. III. c. 12, where they are called justices.

A justice of the peace must, before he acts, take the oath of office, which is always done at the general quarter sessions for the county, by virtue of a *dedimus potestatem* out of chancery.

Sheriffs, coroners, attorneys, and proctors, may not act as justices of the peace.

The power, office, and duty of this magistrate extends to an almost infinite number of instances, specified in some hundreds of acts of parliament, and every year accumulating.

The commission of the peace does not determine by the demise of the king, nor until six months after, unless sooner determined by the successor: but before his demise, the king may determine it, or may put out any particular person; which is most commonly done by a new commission, leaving out such person's name.

Justices of the peace can only be appointed by the king's special commission, and such commission must be in his name; but it is not requisite that there should be a special suit or application to, or warrant from, the king for the granting thereof, which is only requisite for such as are of a particular nature; as constituting the mayor of such a town, and his successors, perpetual justices of the peace within their liberties, &c. which commissions are neither revocable by the king, nor determinable by his demise, as the common commission of the peace is, which is made of course by the lord chancellor, according to his discretion. 1 Lev. 219.

The form of the commission of the peace, as it is at this day, was, according to Hawkins, settled by the judges about the 23 Eliz. 4 Inst. 471.

Qualifications.—On renewing the commission of the peace (which generally happens when any person is newly brought into the same), a writ of *dedimus potestatem* is issued out of chancery to take the oath of him who is newly inserted, which is usually in a schedule annexed; and to certify the same into that court at such a day as the writ commands. Unto which oath are usually annexed the oaths of allegiance and supremacy. Lamb. 53.

Jurisdiction.—It seems now to be settled, that justices of the peace have no power to hear and determine felonies, unless they are authorized so to do by the express words of their commissions; and that their jurisdictions to hear and determine murder, manslaughter, and other felonies and trespasses, is by force of the word *assignavimus* in their commission, which gives them, or two of them (whereof one is of the quorum), power to hear and determine felonies, &c. 2 Haw. P. C. 38. And hence it has been lately adjudged, that the caption of an indictment of trespass before justices of the peace, without adding *neon ad diversas felonias*, &c. assignant, is naught. Trin. 7 G. 1. in B. R. But though justices of the peace, by force of their commission, have authority to hear and determine murder and manslaughter, yet they seldom exercise a jurisdiction herein, or in any other offences in which clergy is taken away, for two reasons: 1. By reason of the monition and clause in their commission, viz. in cases of difficulty to expect the presence of the justices of assize. 2. By the direction of the statute of 1 and 2 P. and M. c. 13, which directs justices of the peace in case of man-

slaughter and other felonies, to take the examination of the prisoner, and the information of the fact, and put the same in writing; and then to bail the prisoner if there is cause, and to certify the same with the bail at the next general gaol-delivery; and therefore in cases of great moment they bind over the prosecutors, and bail the party, if bailable, to the next general gaol-delivery; but in smaller matters, as petty larceny, and in some other cases, they bind over to the sessions; but this is only in point of discretion and convenience, not because they have not jurisdiction of the crime.

As to inferior offences, the jurisdiction herein given to justices of the peace by particular statutes is so various, and extends to such a multiplicity of cases, that it would be endless to endeavour to enumerate them. 6 Mod. 128. It has been held, that not only assaults and batteries, but libels, barratry, and common night-walking, and haunting bawdy-houses, and such like offences, which have a direct tendency to cause breaches of the peace, are cognizable by justices of the peace, as trespasses within the proper and natural meaning of the word. 1 Lev. 139.

Duty.—Justices of the peace are to hold their sessions four times in the year, viz. the first week after Michaelmas, the Epiphany, Easter, and St. Thomas. They are justices of record; for none but justices of record can take a recognizance of the peace. Every justice of the peace has a separate power, and may do all acts concerning his office apart and by himself, and even may commit a fellow-justice upon treason, felony, or breach of the peace; and this is the ancient power which conservators of the peace had at common law. By several statutes justices may act, in many cases, where their commission does not reach; the statutes themselves being a sufficient commission. Wood, Inst. 79, 80.

Justices of the peace are authorised to do all things appertaining to their office, so far as they relate to the laws for the relief, maintenance, and settlement of the poor; for passing and punishing vagrants; for repair of the highways; or to any other laws concerning parochial taxes, levies, or rates; notwithstanding they are rated or chargeable with the rates, with any place affected by such their acts. Provided that this shall not empower any justice for any county at large to act in the determination of any appeal to the quarter-sessions of such county, from any order, matter, or thing, relating to any such parish, township, or place where such justice is so charged or chargeable. 16 Geo. II. c. 18.

PEACE. interjection. A word commanding silence (*Crashaw*).

PEACE-OFFERING: *s.* (*peace and offer*.) Among the Jews, a sacrifice or gift offered to God for atonement and reconciliation for a crime or offence (*Leviticus*).

PEACEABLE. a. (*from peace*;) 1. Free from war; free from tumult (*Swift*). 2. Quiet;

undisturbed (*Spenser*). 3. Not violent; not bloody (*Hale*). 4. Not quarrelsome; not turbulent (*Shakspeare*).

PEACEABLENESS. *s.* (from *peaceable*.) Quietness; disposition to peace (*Hammond*).

PEACEABLY. *ad.* (from *peaceable*.) 1. Without war; without tumult (*Swift*). 2. Without tumults or commotion (*Swift*). 3. Without disturbance (*Shakspeare*).

PEACEFUL. *a.* (*peace and full*.) 1. Quiet; not in war (*Dryden*). 2. Pacific; mild (*Dryden*). 3. Undisturbed; still; secure (*Pope*).

PEACEFULLY. *ad.* (from *peaceful*.) 1. Without war. 2. Quietly; without disturbance (*Dryden*). 3. Mildly; gently.

PEACEFULNESS. *s.* (from *peaceful*.) Quiet; freedom from war or disturbance.

PEACEMAKER. *s.* (*peace and maker*.) One who reconciles differences (*Shakspeare*).

PEACEPARTED. *a.* (*peace and parted*.) Dismissed from the world in peace (*Shakspeare*).

PEACH-TREE, in botany. See AMYGDALUS.

PEACH (Wolf's). See SOLANUM.

PEACH, in mineralogy, chlorite, a species of talc. See TALCUM.

To PEACH. *v. n.* (corrupted from *impeach*.) To accuse of some crime (*Dryden*).

PEACH-COLOURED. *a.* (*peach and colour*.) Of a colour like a peach (*Shakspeare*).

PEACHICK. *s.* (*pea and chick*.) The chick of a peacock (*Southern*).

PEACOCK, in ornithology. See PAVO.

PEAHEN, the female of the bird pavo.

PEAK. *s.* (*peac*, Saxon.) 1. The top of a hill or eminence (*Prior*). 2. Any thing acuminated. 3. The rising forepart of a headdress.

To PEAK. *v. n.* 1. To look sickly (*Shakspeare*). 2. To make a mean figure; to sneak (*Shakspeare*).

PEAK, a mountainous district in the N.W. part of Derbyshire, which abounds in lead, iron, millstones, marble, alabaster, coal, and a coarse sort of crystals. It is much visited on account of its extraordinary caverns, perforations, and other curiosities. The Wonders of the Peak have been celebrated both in prose and verse; and they are noticed in this work under the articles BUXTON, CASTLETON, CHATSWORTH, and TIDESWELL.

PEAK OF TENERIFFE. See TENERIFFE.

PEAL. *s.* A succession of loud sounds: as of bells, thunder, cannon (*Hayward*).

To PEAL. *v. n.* (from the noun.) To play solemnly and loud (*Milton*).

To PEAL. *v. a.* To assail with noise (*Milton*).

PEAR (Avocado). See LAURUS.

PEAR (Prickly). See CACTUS.

PEAR (Garlic). See CRATEVA.

PEARCE (Zachary), son of a distiller in Holborn, was educated at Westminster school and Trinity college, Cambridge. Distinguished at the university, and by some entertaining papers in the Guardian and the Spectator, he was patronized by Parker, earl of Macclesfield, to

whom he dedicated his edition of Longinus, and from whom he obtained preferment. In 1739 he was made dean of Winchester, in 1748 bishop of Bangor, and in 1756 bishop of Rochester, and dean of Westminster. These last honours were unsolicited, and the bishop, who longed for the privacy of retired life, was anxious to resign; but he was permitted to divest himself only of the deanery of Westminster, in favour of Dr. Thomas. He died 1774. Dr. Pearce was eminent for his classical knowledge. He wrote a vindication of the miracles against Woolston, besides an account of Trinity college, Cambridge—letters against Conyers Middleton, &c.—a review of Milton's text—an essay on the origin of temples—sermons, &c. After his death appeared his commentary on the four evangelists, and the acts, 2 vols. 4to.—and 4 vols. of sermons, 8vo.

PEARCH. See PERCA and PERCH.

PEARL, in natural history, a hard concretion, of a brilliant silvery, or bluish white colour, found in some species of the oyster and muscle. See MARGARITA, OSTREA, and MYTILUS.

Pearls, though esteemed of the number of gems by our jewellers, and highly valued, not only at this time but in all ages, are supposed to proceed from a distemper in the creature that produces them, analogous to the bezoars and other stony concretions in several animals of other kinds.

The fish in which these are usually produced is the East Indian pearl-oyster, as it is commonly called. Besides this shell, there are many others that are found to produce pearls; as the common oyster, the muscle, and several others; the pearls of which are often very good; but those of the true Indian berberi, or pearl-oyster, are in general superior to all. The small or seed-pearls, also called ounce-pearls, from their being sold by the ounce and not by tale, are vastly the most numerous and common; but, as in diamonds, among the multitudes of small ones, there are smaller numbers and larger found, so in pearls there are larger and larger kinds; but as they increase in size, they are proportionably less frequent; and this is one reason of their great price. We have Scotch pearls frequently as big as a little tare, some as big as a large pea, and some few of the size of a horse bean; but these are usually of a bad shape, and of little value in proportion to their weight. Philip II. of Spain had a pearl perfect in its shape and colour, and of the size of a pigeon's egg. The finest, and what is called the true shape of the pearl, is a perfect round; but if pearls of a considerable size are of the shape of a pear, as is not unfrequently the case, they are not less valued, as they serve for ear-rings and other ornaments. Their colour ought to be a pure white; and that not a dead and lifeless, but a clear and brilliant one: they must be perfectly free from any foulness, spot, or stain; and their surfaces must be naturally smooth and glossy; for they bring their

natural polish with them, which art is not able to improve.

All pearls are formed of the matter of the shell, and consist of a number of coats spread with perfect regularity one over another, in the manner of the several coats of an onion, or like the several strata of the stones found in the bladders or stomachs of animals, only much thinner.

PEARL (Mother of), is the shell, not of the pearl oyster, but of another sea fish of the oyster kind. This shell is extremely smooth on the inside, and of the whiteness and water of pearl itself: it has a like lustre on the outside, after the first laminæ or scales have been cleared off with aquafortis and the lapidaries mill. Mother of pearl is used in inlaid works, and in several toys, as snuff-boxes, &c.

PEARL, in heraldry, in blazoning with precious stones, is the same with argent, or white.

PEARL ASH, an alkali used in various manufacturing processes: it is potash mixed with different heterogeneous substances. See **POT-ASH**.

PEARL BARLEY. See **HORDEUM**.

PEARL SPAR, in mineralogy, a name given to a species of iron ore, and of spar: see the articles **FERRUM** and **SPATHUM**.

PEARL FISHERY. The most important fishery to England at present is that at Ceylon. The origin of this method of procuring a valuable ornament for the person must have arisen from accidentally discovering the pearl within oysters taken for food is evident; but it is impossible to ascertain when the search became systematical, though it is extremely probable it has been so for very many ages.

The pearl oysters of the coast of Ceylon are all of one species, and possess the same regularity of form; but they assume different qualities, and have different denominations, suited to the nature of the ground where they are situated, and from the appearance of zoophytes adhering to the external surface of their shells. See **MYTILUS MARGARITIFERUS**.

They resemble a cockle in shape, which is an imperfect oval, and their circumference is generally about nine inches and a half, having a segment as it were cut off where the joint of the two shells occurs. The interior of those is far more brilliant and beautiful than the pearl they enclose, and the outside is smooth, except when injured by the usurpations of sponges, corals, and other marine productions. The flesh of the animal is white, and of a glutinous consistency.

Perhaps no class of animated nature undergoes more unmerited persecution and destruction than the pearl-oyster; when situated in their native regions, they afford a foundation for the habitations of other animals, and millions of them are dragged from their banks, and thrown away, for what they are vainly supposed to contain, and that an intruder or a disease. One of the banks at Ceylon furnishes oysters to which zoophytes are attached, apparently belonging to the class of sponges, and those generally resemble a funnel or cup, and grows

to a size that completely overshadows the oyster; others of different banks have a substance adhering to them tinged with red. The above are found to contain the finest pearls: some escape free from incumbrance, and thousands are compelled to bear trees of coral on them of five times their own weight.

The oyster is fastened to the rocks at the bottom of the sea by quantities of hairy fibres. By this means they are not readily swept from their original station, and yet possess the advantage of being conveyed to some distance from it by the motion of the water; besides they are connected to each other in the same manner. It frequently happens that an old oyster, surrounded by young ones, is brought up by the divers, and the latter have been ascertained to possess, even when little larger than a grain of sand, the power of moving themselves by the extension and contraction of what is termed the beard. The violence of the waves at the time of the monsoons occasions great changes in the state of the banks, when incredible numbers of them are buried by the shifting of sand, and that is sometimes removed by the same power acting in a contrary direction.

It is supposed, from many concurring circumstances, that the pearl-oyster arrives at maturity at the close of seven years; after this period it is imagined that it dies, when the body decaying is washed away by the sea: a bed was discovered a few years since composed almost wholly of empty shells. The precious substance, which invites the exertions of man to obtain it, has been generally supposed to be a disease peculiar to the animal; but were this the fact, it is extremely prevalent amongst this description of oysters, as every individual of the species is found to be accompanied by a certain proportion of minute particles, which are evidently the pearl in the first stages of formation; hence it may be fairly supposed, that they are in some essential degree useful, rather than prejudicial to the inhabitant of the shells, of the nature of which it decidedly partakes, and is composed of a number of layers, moveable by a skilful person to the improvement of the pearl, as it sometimes happens the exterior coat only may be discoloured or injured. When the pearl is in a state of perfection they are of a brilliant white, some have been found of a beautiful tint of pink, of the colour of gold, and a few entirely black. These variations are, however, very uncommon.

The pearls are discovered near the angles of the shell, and close to the hinge, where the animal is most thick and fleshy; they are generally numerous, and in some instances 150 have been taken from one oyster; on the other hand, an hundred oysters have been opened whence a pearl could not be extracted fit for any purpose whatever.

Attempts were made some years past to transplant this species of oysters, but without success, as they invariably died during their transportation.

The first step previously to a fishery is the

PEARL FISHERY.

examination of the banks, which takes place at the end of October, during the short interval of fine weather usual between the close of the south-west monsoon and the commencement of the north-east. One pilot, two divers, and eight or more sailors, to each boat, are employed upon this service, and there are generally nine boats. The superintendant on the part of government accompanies the principal arripaana, or pilot, who is taught his profession from his infancy, inheriting it from his father, in the manner of most occupations in the East. The boats visit the banks in a body, and the divers frequently descending, ascertain its exact position, and at the same time bring up a thousand or more oysters as specimens, which are examined by persons who, from experience, are enabled to judge whether it is probable they are of an age calculated to answer the purposes of the intended fishing: this examination is not, however, deemed sufficient, and the oysters are opened, when the pearls are extracted, and after sorting them they are valued. It is really shocking to humanity to reflect, that if one thousand oysters produce as many pearls as are worth three pounds sterling, the fishery is undertaken, as it has been found that the examination of that number is a sufficient designation of success, or the reverse.

In the progress of this preliminary part of the undertaking, the oysters are found at various periods of their growth: those not more than one year old are very small, being less than an inch in circumference, and the full grown oysters are as large as the palm of the hand of a man: between the ages of four and five years the seed pearl only is discovered; but after this period they increase in size very rapidly; and, as has been before observed, they die after the eighth year. After completely satisfying themselves as to the probability of future success, the result is published, for the information of those who may be inclined to partake of the probable advantages. Since the island of Ceylon has been a part of the British empire, each fishing season has either been reserved for the exclusive use of government, or rented to speculative persons: but the produce has never amounted to 200,000*l.* on any one occasion. The most common practice is to farm the season to an individual, who lets the right of partaking to others.

The fourteen banks, or beds, on which the oysters are found, are situated in the bottom of the gulph of Manaar, and are included in a space about thirty miles in length, from north to south, and twenty-four in breadth. It has been ascertained, that the largest of those beds is ten miles long, and two broad; the remainder are much smaller; nor are they all equally productive, as it seldom happens that more than three beds can be marked for use in any given season. The spots where the oysters lay are not raised higher than the surrounding parts, except by their accumulation, and the coral rocks, on which the most valuable are placed, are on a level with the sand: the depth

of water over them varies from eighteen to ninety feet, and the most convenient and best fishing is at the depth of between six and eight fathoms. When it is thought proper to undertake a fishery, advertisements are issued in the English and Malabar languages, inviting the possessors of boats suited for the purpose, and all divers, to meet on the 20th of February in the bay of Condaatchy: vessels of this description assemble from various places on the coast of Coromandel, completely equipped, and furnished with every necessary for the accomplishment of their intentions: those are open, of about one ton burthen, forty-five feet in length, seven or eight wide, and three deep in the hold; and are so constructed as to draw not more than eight or ten inches water, unless they are heavily laden, and are navigated with one sail only. They have a complement of twenty-three men, whose employments are thus appropriated: one pilot, one man for the helm; another to take care of the boat; one to lade out water; ten divers; ten mundrees, who haul up the divers, the stones, and the baskets: and a peon attends on the part of the renter, to take care that his interests do not suffer from fraud.

A second examination of the banks takes place a few days before the operations begin, which is merely for the purpose of anchoring buoys to point out the situation of the banks, and those parts of them most abounding with the object of search. A small sloop is from the first stationed in the centre of the banks, where she remains for the double purpose of guarding the buoys, and as a guide to the boats. The pilot boats make a circuit of twelve or fifteen miles round the sloop, sounding and sending down the divers, and upon discovering a place remarkable for the number of oysters, a buoy is immediately placed over it, which consists of triangular rafts of wood, fastened by a cable attached to a wooden anchor, sunk by two stones. The rafts support flags of various colours; and drawings of those are inserted in a book, where a minute description is given of the name, quality, and age, of the oysters on the bank under each flag. Three hours sailing of the boats employed in the pearl fishery from the shore of Condaatchy, or a distance of about fifteen miles, occurs between the banks and that place: unfortunately the land near them is so low, that it is impossible to make use of it in ascertaining their position; it becomes, therefore, absolutely necessary to renew at each fishery the fatiguing operation of sounding and diving, the buoys being all removed at the close of their labours, as they would serve to point out the places for depredators to dive with success.

Mr. Cordiner, from whose late interesting account of Ceylon we have extracted most of the preceding particulars, says, "As the boats arrive at Condaatchy to be employed in the fishery, they are regularly numbered, and their description and the names of their crew are registered in a book. The fishery for the season of 1804 was let by government to a native

PEARL FISHERY.

of Jaffnapatam, who had resided for some years previously to it on the coast of Coromandel. For thirty days fishing, with 150 boats, he came under an obligation to pay 300,000 Porto Novo pagodas, or 120,000l. sterling. He sold the right of fishing to some of the best equipped boats for 3000. pagodas each, and that of others for 2500; but kept by far the greater part of them to fish on his own account."

After every arrangement is completed, and the boats are ready to put to sea, their navigators and the divers are roused from their slumbers by the discharge of a cannon, the sounding of horns, and the beating of a kind of drum, called by the natives *tom toms*: this signal is generally made rather before midnight, when a breeze from the land prevails; the confusion that immediately follows the movements of upwards of six thousand persons in the dark may be better conceived than described; but in defiance of every obstacle, these silly people will not depart till they have performed certain ablutions and incantations, calculated, as they suppose, to forward their views. When they have reached the banks they cast anchor, and wait the approach of day; which no sooner arrives than each boat takes its station: at six or seven o'clock the diving commences. To facilitate this operation, a species of open scaffolding is projected from each side of the vessel, and it is from the scaffold the tackle is suspended, three stones on one side and two on the other. The author we have just mentioned gives so clear and comprehensive an account of this dangerous business, which he saw performed, that we shall give part of it in his own words. "The diving stone hangs from an oar by a light country rope, and slip knot, and descends about five feet into the water. It is a stone of 56lb. weight, of the shape of a sugar loaf. The rope passes through a hole in the top of a stone, above which a strong loop is formed, resembling a stirrup-iron, to receive the foot of the diver," who is entirely naked, except a piece of *enhio* wrapped round his waist; swimming near the side of the vessel, he takes the rope in one hand, and places his foot in the stirrup on the stone; a basket is then thrown into the water to him, made of a hoop and net work below it, in which he places the other foot: after preparing his lungs for ceasing to breathe, he presses his nostrils firmly with one hand, and with the other pulls the rope forming the slip-knot; the stone carries him instantly to the bottom, where he no sooner arrives, than he disengages himself from the stirrup, which, with the stone, is immediately drawn up by the people in the boat. The diver throws himself forward upon his face, and grasps every thing in his way as rapidly as possible, and putting it into the basket, gives a signal when it is full by pulling the rope, when that also is hauled up; he then ascends by the rope, and frequently arrives at the surface before the basket: such is the consequence of custom, that though the diver cannot descend

again without an interval of rest, he seldom enters the boat, remaining swimming and floating about during the whole day.

Besides the other dangers peculiar to this pursuit, the divers are liable to be devoured by sharks: but whatever may be the cause, an accident seldom occurs, which these superstitious people attribute to the powerful aid of shark charmers, without whom, and the exercise of their diabolical incantations, they will on no account undertake their labours. The most experienced diver has never been known to remain longer than one minute and a half under water, in which time he may gather 150 oysters, if they are numerous; but he sometimes gains not more than from five to a dozen, accompanied by coral pieces of rock and other substances, for he has no time to separate and examine what he seizes. When 300 boats are employed in the fishery, it is supposed that at least 1500 divers are constantly descending, the noise of which resembles the incessant roaring of a cataract. The return of the fleet in regular order, at one or two P. M. and their arrival, with the crowds waiting to welcome their return, presents a very animating and gratifying spectacle.

The method adopted to extract the pearls is dreadfully disgusting and unwholesome, as they do not undertake this operation till the oysters have been deposited in heaps for ten days, or till the flesh has become decidedly putrid: the reason for so doing is obvious, as the particles of decayed matter and maggots are readily floated off by repeated washings in inclined receptacles, so contrived as to arrest the progress of even the smallest pearls, as they descend by their weight. Every possible precaution is taken, by picking and sifting, to secure the whole of the produce, and yet it is said that vast numbers are lost.

After the most valuable are selected, they are sent to be drilled; a most ingenious and delicate operation, which is thus performed: a piece of wood in the shape of an inverted cone is placed upon three legs, raising it about one foot from the ground: holes of various dimensions are made in the surface to receive the pearls: the person who drills sits close to the machine; he then drives the pearls steady into their sockets. "A well-tempered needle is fixed in a reed five inches long, with an iron point at the other end, formed to play in the socket of a cocoa nut shell, which presses on the forehead of the driller. A bow is formed of a piece of bamboo and a string. The workman brings his right knee in a line with the machine, and places on it a small cup, formed of part of a cocoa nut shell, which is filled with water to moderate the heat of friction. He bends his head over the machine, and applying the point of the needle to a pearl sunk in one of the pits, drills with great facility, every now and then dexterously dipping the little finger of his right hand in the water, and applying it to the middle, without impeding the operation. In this manner he bores a

pearl in the space of two or three minutes, and in the course of a day perforates 300 small, or 600 large pearls."

There are different methods of fishing for pearls practised in other parts of the world; but as the Ceylon fishery eclipses them all, and the simplicity of the invention is so obvious, it would be well if it were universally adopted.

PEARLSTEIN, or PEARLSTONE, in mineralogy, occurs in round and longish vesicles. Its lustre is shining and pearly, and its colour varies from the pearl to the flesh red and greyish black. It is composed of thin, concentric, lamellar concretions. It is translucent on the edges, easily frangible, and soft. It occurs in porphyry, and contains balls of obsidian, and is found in Hungary. It is composed of

Silex	75.25
Alumina	12.
Oxid of iron	1.6
Potash	4.5

PEARLS (Artificial). Attempts have been made to take out stains from pearls, and to render the foul opaque-coloured ones equal in lustre to the oriental. Abundance of processes are given for this purpose in books of secrets and travels; but they are very far from answering what is expected from them. Pearls may be cleaned indeed from any external foulnesses by washing and rubbing them with a little Venice soap and warm water, or with ground rice and salt, with starch and powder-blue, plaster of Paris, coral, white vitriol and tartar, cuttle-bone, pumice-stone, and other similar substances; but a stain that reaches deep into the substance of pearls is impossible to be taken out. Nor can a number of small pearls be united into a mass similar to an entire natural one, as some pretend.

There are, however, methods of making artificial pearls in such manner as to be with difficulty distinguished from the best oriental. The ingredient used for this purpose was long kept a secret; but it is now discovered to be a fine silver-like substance found upon the under side of the scales of the blay or bleak fish. The scales, taken off in the usual manner, are washed and rubbed with fresh parcels of fair water, and the several liquors suffered to settle: the water being then poured off, the pearly matter remains at the bottom, of the consistence of oil, called by the French essence d'orient. A little of this is dropped into a hollow bead of blueish glass, and shaken about so as to line the internal surface; after which the cavity is filled up with wax, to give solidity and weight. Pearls made in this manner are distinguishable

from the natural only by their having fewer blemishes.

PEAR'LED. *a.* (from *pearl*.) Adorned or set with pearls (*Milton*).

PEAR'LEYED. *a.* (*pearl* and *eye*.) Having a speck in the eye.

PEARLWORT. See *SAGINA*.

PEARLY. *a.* (from *pearl*.) 1. Abounding with pearls; containing pearls (*Woodward*).

2. Resembling pearls (*Drayton*).

PEA'RMAIN. *s.* An apple (*Mortimer*).

PEARSON (John), a very learned English bishop in the 17th century, was born at Snoring in 1613. After his education at Eton and Cambridge, he entered into holy orders in 1639, and was the same year collated to the prebend of Netherhaven in the church of Sarum. In 1640 he was appointed chaplain to the lord keeper Finch, and by him presented to the living of Torrington in Suffolk. In 1650 he was made minister of St. Clement's, East-cheap, in London. In 1657, he and Mr. Gunning had a dispute with two Roman Catholics upon the subject of schism; a very unfair account of which was printed at Paris in 1658. Some time after, he published at London an Exposition of the Creed, in folio, dedicated to his parishioners of St. Clement's, East-cheap, to whom the substance of that excellent work had been preached several years before, and by whom he had been desired to make it public. The same year he likewise published *The Golden Remains of the ever memorable Mr. John Hales of Eton*; to which he prefixed a preface, containing, of that great man, with whom he had been acquainted for many years, a character drawn with great elegance and force. Soon after the Restoration, he was presented by Juxon, then bishop of London, to the rectory of St. Christopher's in that city; created doctor of divinity at Cambridge, in pursuance of the king's letters mandatory; installed prebendary of Ely; archdeacon of Sarum; and made master of Jesus college in Cambridge: all before the end of the year 1660. March 25th, 1661, he was appointed Margaret professor of divinity in that university; and, the first day of the ensuing year, was nominated one of the commissioners for the review of the liturgy in the conference at the Savoy. April 14th, 1662, he was admitted master of Trinity college in Cambridge; and, in August, resigned his rectory of St. Christopher's and prebend of Sarum. In 1667 he was admitted a fellow of the Royal Society. In 1672 he published at Cambridge, in 4to, *Vindiciæ Epistolæ S. Ignatii*, in answer to Mons. Dailé; to which is subjoined, *Isaaci Vossii epistolæ duæ adversus Davidem Blondellum*. Upon the death of the celebrated Wilkins, Pearson was appointed his successor in the see of Chester, to which he was consecrated February 9th, 1672-3. In 1682, his *Annales Cyprianici, sive tredecim annorum, quibus S. Cyprian, inter Christianos versatus est, historia chronologica*, was published at Oxford, with Fell's edition of that father's works. Pearson was disabled from all

public service by ill health a considerable time before his death, which happened at Chester, July 16th, 1686.

PEAR-TREE, the tree that bears pears. See PYRUS.

PEASANT, a hind; one whose business is rural labour. It is amongst this order of men that a philosopher would look for innocent and ingenuous manners. The situation of the peasantry is such as secludes them from the devastations of luxury and licentiousness; for, when the contagion has once reached the recesses of rural retirement, and corrupted the minds of habitual innocence, that nation has reached the summit of vice, and is hastening to that decay which has always been the effect of vicious indulgence. The peasantry of this country till lately retained that simplicity of manners and rustic innocence which ought to be the characteristic of this order of society; and, in many parts, their condition is still such as, were all its advantages sufficiently known, would create envy in the minds of those who have toiled through life, amidst the bustle of the world, in quest of that happiness which it could not confer.

*O fortunatos nimium, sua si bona norint,
Agricolae.* — VIRGIL.

In other countries the peasants do not enjoy the same liberty as they do in our own, and are consequently not so happy. In all feudal governments they are abject slaves, entirely at the disposal of some petty despot. Much of the happiness and of the real prosperity of a country depend upon the state of the peasantry.

"Ill fares the land, to hastening ills a prey,
Where wealth accumulates, and men decay:
Princes and lords may flourish, or may fade;
A breath can make them as a breath has made;
But a bold peasantry, their country's pride,
When once destroy'd, can never be supplied."

GOLDSMITH.

PEASANTRY. *s.* Peasants; rustics; country people (*Locke*).

PEASCOD. **PEASHELL**. *s.* (*pea, cod* and *shell*). The husk that contains peas (*Gay*).

PEASE. *s.* Food of peas (*Arbutnot*).

PEAT, in mineralogy, a combustible material often called turf, consisting of a congeries of vegetable matter, in which the remains of organization are more or less visible; comprising trunks of trees, chiefly oak, fir, birch, alder, hazle, and willow; of leaves and fruits, particularly hazle-nuts; and of long stringy fibres which appear for the most part the remains of the sphagnum palustre, and other aquatic mosses. It occurs, for the most part, in extensive beds called peat-mosses, either occupying the surface of the soil, or covered to the depth of a few feet with sand, gravel and other alluvial matters. It is met with abundantly in the northern and in some of the central districts of Europe, in all moist uncultivated mountainous tracts, as high as vegetation extends; it is also frequent in low vallies and fenny plains; and in several parts of the western shore of Great Britain runs into the sea, to an

unknown extent, as in the harbour of Oban in Argyleshire; in Lancashire, a little town to the north of Liverpool; and near Towyn in Merionethshire.

The depth of peat-mosses is very various; from a few feet to twelve or fifteen yards or even more. The consistence of peat is equally various, being sometimes in a semifluid state, forming a black impassable wilderness, studded here and there by tufts of rushes. When more solid it is scantily covered over with heath and coarse grasses, and is then passable by sheep and other larger animals, especially during the dry season of the year. In all deep peat-mosses it is found that the upper part of the peat is looser, of a lighter colour, and less inflammable than that which forms the lower part of the bed. When of a good quality it is moderately compact, and may readily be cut into solid masses like bricks with a sharp thin spade. If it manifests any considerable degree of elasticity and resistance to the spade, its quality is always found to be very inferior. By exposure to the air it dries slowly, being very retentive of moisture, acquires a brownish black colour, becomes moderately hard, and in this state is very inflammable. By the further action of the weather it falls gradually to pieces, and is decomposed though very slowly. When kindled in an open grate the best kind burns with a yellowish-blue flame almost like charcoal, and a less quantity of smoke than wood affords: it gives out a great quantity of heat, and is reduced to light ashes of a white or reddish-yellow colour. Some varieties of peat are considerably charged with iron pyrites, on which account they effloresce and vitriolize when exposed to the air, and in burning give out a strong sulphureous odour, much smoke and little heat, and afford a heavy reddish-brown ash. Sulphats of soda and magnesia are also occasionally found in peat, and produce a similar bad effect on it, considered as a combustible.

By digestion in boiling water peat affords a deep brown solution, slightly bitter to the taste, and containing an uncombined vegetable acid considerably resembling the suberic, with a portion of extract, and a little sulphat.

By dry distillation there comes over a watry ammoniacal liquor, an empyreumatic oil, and carburetted hydrogen, a considerable quantity of charcoal remaining in the retort.

Many ingenious attempts have been made, especially in France and Germany, to substitute with economy the charcoal of peat for that of wood, for culinary and metallurgical purposes, and it seems to be satisfactorily proved that a given bulk of the former burns somewhat longer, and affords a more considerable heat than of the latter; but it appears to be incapable of withstanding the action of a forge bellows, and is apt to deteriorate the quality of iron that is smelted by it. Another objection however occurs to the employment of peat charcoal on the score of its being less economical, except in very particular circumstances, than wood charcoal. It cannot be prepared in

the manner of common charcoal, on account of its loose texture, without a prodigious loss of the substance and deterioration of quality: the manufacturer must therefore have recourse to distillation in iron cylinders, or other vessels; but to effect this so large a quantity of peat must be consumed as fuel, that the value of the charcoal, the oil and ammonia will hardly cover the expence. Hence it is that all the establishments in France for this purpose have of late been entirely abandoned. See the article *TURFA*.

PEAT. s. (from *petit*, Fr.) A little fondling; a darling: now commonly *pet* (*Donne*).

PEAUCIER, in anatomy, a name given by Winslow, in his Treatise on the Head, and by some of the French writers, to the muscle called by Albinus *latissimus colli*; and by others *dehrens quadratus*, and *quadratus genæ*. Santorini has called the part of this which arises from the cheek *musculus risorius novus*; and some call the whole *platysma myoides*.

PEBBLES, the name of a genus of fossils, distinguished from the flints and homocroa by their having a variety of colours. These are defined to be stones composed of a crystalline matter debased by earths of various kinds in the same species, and then subject to veins, clouds, and other variegations, usually formed by incrustation round a central nucleus, but sometimes the effect of a simple crystallization; and veined like the agates, by the disposition which the motion of the fluid they were formed in gave their differently coloured substances.

The variety of pebbles is so great, that an hasty describer would be apt to make almost as many species as he saw specimens. A careful examination will teach us, however, to distinguish them into a certain number of essentially different species, to which all the rest may be referred as accidental varieties. When we find the same colours, or those resulting from a mixture of the same, such as nature frequently makes in a number of stones, we shall easily be able to determine that these are all of them the same species, though of different appearances; and that whether the matter be disposed of in one or two, or in 20 crusts, laid regularly round a nucleus; or thrown irregularly, without a nucleus, into irregular lines; or, lastly, if blended into an uniform mass.

See *PYROMACHUS* and *PETROSILEX*.

PEBBLED. a. (from *pebble*.) Sprinkled or abounding with pebbles (*Thomson*).

PEBBLY. a. (from *pebble*.) Full of pebbles.

PECARI, in mastiology. See *Sus*.

PECCABILITY. s. (from *peccable*.) State of being subject to sin (*Decay of Piety*).

PECCABLE. a. (from *pecco*, Lat.) Liable to sin.

PECCADILLO. s. (Spanish; *peccadille*, Fr.) A petty fault; a slight crime; a venial offence (*Atterbury*).

PECCANCY. s. (from *peccant*.) Bad quality (*Wiseman*).

PECCANT. a. (*peccant*, Fr.) 1. Guilty; criminal (*South*). 2. Ill-disposed; corrupt;

bad; offensive to the body; injurious to health (*Arbutnot*). 3. Wrong; bad; deficient; informal (*Ayliffe*).

PECHBLENDE, in mineralogy, a species of *URANIUM*, which see.

PECHLARN, a town of Austria, on the right bank of the Danube. The river is very wide; and here the Romans, who called it *Præclara*, had a harbour for their navy. It is 14 miles W. of St. Polten, and 48 E. of Linz.

PECHURIM CORTEX. An highly aromatic bark, the produce of a species of *laurus*. It is extremely fragrant, like that of cinnamon, which it greatly resembles in its properties. In Lisbon it is much esteemed in the cure of dysenteries, and for allaying obstinate vomitings.

PECHURIM FABA. See *FABA PECHURIM*.

PECHURIS. See *PECHURIM*.

PECHYS, a name used by some anatomical writers for the elbow.

PECK (Francis), an antiquary, born 1692, at Stamford, Lincolnshire. He was educated at Cambridge, and obtained the living of Godeby, near Melton, Leicestershire, where he died 1743. He published 1727, in folio, *The Antiquarian Annals of Stamford, &c.*—*Memoirs of Cromwell and of Milton*, 2 vols. 4to. He published besides *Desiderata Curiosa*, 2 vols. containing curious pieces of English history, &c.

PECK. s. (from *poea*, Saxon.) 1. The fourth part of a bushel (*Hudibras*). 2. Proverbially. (In low language.) A great deal (*Suckling*).

To PECK. v. a. (*becquer*, Fr. *picken*, Dut.) 1. To strike with the beak as a bird. 2. To pick up food with the beak (*Addison*). 3. To strike with any pointed instrument (*Carew*). 4. To strike; to give blows (*South*).

PECKER. s. (from *peck*.) 1. One that pecks. 2. A kind of bird: as the wood-pecker (*Dryden*).

PECKLED. a. (corrupted from *speckled*.) Spotted; varied with spots (*Walton*).

PECKWELL (Henry), a divine of the church of England, and rector of Bloxham, in Lincolnshire. He was born in 1747, and attached himself to the Calvinistic methodists, among whom he was very popular. Dr. Peckwell was the principal founder of a society for visiting the sick at their own homes; and, to make himself the more useful, he studied physic. In opening a young person who died of a putrid fever, he unfortunately wounded himself in the hand, which mortified, and ended in his death in 1787. He printed some sermons preached on particular occasions.

PECORA. In the general system of Linneus, the fifth order in the class mammalia, thus ordinarily characterized: without fore-teeth in the upper jaw, many in the lower; feet hoofed, cloven; food, herbs which they pluck; they chew the cud; have four stomachs, the paunch to macerate and ruminate the food, the bonnet, reticulate, to receive it, the omasus or manipples of numerous folds to digest it, and

the abomasus or caille, fasciate, to give it ascescency and prevent putrefaction. See ZOOLOGY.

PECQUET (John), a celebrated physician, born at Dieppe. He immortalized his name by the discovery of the lacteal vein which conveys the chyle to the heart, and from him termed the reservoir of Pecquet. In 1654, he published, at Paris, a work entitled *Experimenta nova Anatomica*, and in 1661, at Amsterdam, *De Thoracis Lacteis*, which added greatly to his reputation. He died at Paris in 1674.

PECQUET (Antoine), a celebrated French scholar, born in 1704. His writings, which are numerous, shew at once the philosopher, the politician, and the moralist. His *Spirit of the Laws*, and of *Political Maxims*, and *Thoughts on Man*, are the most esteemed. He was made grand-master of the water-works and forests of Rouen, and died in 1762. (*Watkins*).

PECQUET'S DUCT. See **THORACIC DUCT**.

PECTEN. See **OSTREA**.

PECTINÆUS, in myology. See **PECTINALIS**.

PECTINALIS. (*pectinalis musculus*, so named from its arising at the *pecten*, or pubis.) *Pectinæus* of Albinus. In myology. This is a small flat muscle, situated obliquely between the pubis and the little trochanter, at the upper and anterior part of the thigh. It arises broad and fleshy from all the anterior edge of the os pectinis, or pubis, as it is more commonly called, as far as its spine, and descending obliquely backwards and outwards, is inserted by a short and broad tendon, into the upper and anterior part of the *linea aspera* of the os femoris a little below the lesser trochanter. This muscle serves to bend the thigh, by drawing it upwards and inwards, and likewise assists in rolling it outwards.

PECTINATE LEAF. A sort of pinnate leaf, in which the leaflets are toothed like a comb: as in *artemisia pectinata*. The term is also used in the same sense in zoology.

PECTINATI MUSCULI. (*Pectinatus*, from *pecten*, a comb; so named from their supposed resemblance.) The fasciculated muscular fibres of the right auricle of the heart.

PECTINATION. *s.* The state of being pectinate.

PECTIS, in botany, a genus of the class syngenesia, order polygamia superflua. Receptacle naked; seeds crowned with three or four awns; calyx five-leaved; florets of the ray five. Five species, natives of the West Indies.

PECTORAL, a sacerdotal habit or vestment, worn by the Jewish high-priest. The Jews called it *hoshchen*, the Greeks *κορυμβιον*, the Latins *rationale* and *pectorale*, and in our version of the Bible it is called *breastplate*. It consisted of embroidered stuff, about a span square, and was worn upon the breast, set with twelve precious stones, ranged in four rows, and containing the names of the twelve tribes. It was fastened to the shoulder by two chains

and hooks of gold. God himself prescribed the form of it. See **BREASTPLATE**.

PECTORALIS. In anatomy. See **PECTORALIS MAJOR**.

PECTORALIS MAJOR. (*masculus pectoralis*; from *pectus*, the breast.) *Pectoralis* of Albinus. This is a broad, thick, fleshy, and radiated muscle, situated immediately under the integuments, and covering almost the whole anterior part of the breast. Winslow calls it *pectoralis major*, to distinguish it from the *serratus anticus*, which he has named *pectoralis minor*. It arises from the cartilaginous extremities of the fifth and sixth ribs, from the last of which its tendinous fibres descend over the upper part of the obliquus externus and rectus abdominis, helping to form a part of the sheath in which the latter is included. It likewise springs from almost the whole length of the sternum by short tendinous fibres, which evidently decussate those on the other side; and tendinous and fleshy from more than a third of the anterior part of the clavicle. From these origins the fibres run in a folding manner towards the axilla, and are inserted by a broad tendon into the os humeri, above the insertion of the deltoid muscle, and at the outer side of the groove which lodges the tendon of the long head of the biceps: some of its fibres likewise extend into that groove; and, from the lower part of this tendon, which is spread near two inches along the os humeri, we find it sending off other fibres, which help to form the fascia that covers the muscles of the arm. It often happens, that that part of the *pectoralis* which arises from the clavicle is separated from the inferior portion, so as to appear like a distinct muscle. This has induced Winslow to divide it into parts, one of which he calls the *clavicular*, and the other the *thoracic portion*. Sometimes these two portions are inserted by separate tendons, which cross one another at the upper and inner part of the os humeri, the tendon of the thoracic portion being inserted at the outer edge of the bicipital groove, immediately behind the other. This muscle, and the *latissimus dorsi*, form the cavity of the axilla or arm-pit. The use of the *pectoralis* is to move the arm forwards, or to raise it obliquely towards the sternum. It likewise occasionally assists in moving the trunk upon the arm; thus, when we exert any efforts with the hand, as in raising ourselves from off an arm-chair, or in sealing a letter, the contraction of this muscle is particularly observable. To these uses Haller adds that of assisting in respiration, by raising the sternum and ribs. He tells us he well remembers, that when this muscle was affected by rheumatism, his breathing was incommoded: and that, when troubled with difficulty of respiration, he has often found himself greatly relieved by raising and drawing back his shoulders, keeping his arms at the same time firmly fixed. Winslow, however, has denied this use, and Albinus has omitted it, probably because it does not take place in a natural state.

PECTORALIS MINOR. *Serratus anticus* of K 2

Albinus. Douglas calls this muscle serratus minor anticus, and Winslow gives it the name of pectoralis minor. It is a fleshy and pretty considerable muscle, situated at the anterior and lateral part of the thorax, immediately under the pectoralis major. It arises from the upper edges of the third, fourth, and fifth ribs, near where they join with their cartilages by an equal number of tendinous and fleshy digitations, which have been compared to the teeth of a saw, whence this and some other muscles, from their having a similar origin or insertion, have gotten the name of serrati. From these origins it becomes thicker and narrower as it ascends, and is inserted by a flat tendon into the upper part of the coracoid process of the scapula. The principal use of this muscle is to draw the scapula forwards and downwards; and when that is fixed, it may likewise serve to elevate the ribs.

PECTORALS. (*medicamenta pectoralia*, from *pectus*, the breast,) Medicines that relieve disorders of the chest.

PECTUS. The breast. See **THORAX**.

PECULATE. **PECULATION.** *s.* (*peculatus*, Lat. *peculat*, Fr.) Robbery of the public; theft of public money.

PECULATOR. *s.* (Latin.) Robber of the public.

PECULIAR. *a.* (*peculiaris*, Lat.) 1. Appropriate; belonging to any one with exclusion of others (*Swift*). 2. Not common to other things (*Locke*). 3 Particular; single (*Milton*).

PECULIAR. *s.* 1. The property; the exclusive property (*Milton*). 2. Something absconded from the ordinary jurisdiction (*Carew*).

PECULIAR, in the canon law, signifies a particular parish or church that has jurisdiction within itself for granting probates of wills and administrations, exempt from the ordinary or bishop's court. The king's chapel is a royal peculiar, exempt from all spiritual jurisdiction, and reserved to the visitation and immediate government of the king himself. There is likewise the archbishop's peculiar: for it is an ancient privilege of the see of Canterbury, that wherever any manors or advowsons belong to it, they forthwith become exempt from the ordinary, and are reputed peculiars: there are 57 such peculiars in the see of Canterbury. Besides these, there are some peculiars belonging to deans, chapters, and prebendaries, which are only exempted from the jurisdiction of the archdeacon: these are derived from the bishop, who may visit them, and to whom there lies an appeal.

PECULIARS (Court of), is a branch of, and annexed to, the court of Arches. It has a jurisdiction over all those parishes dispersed through the province of Canterbury in the midst of other dioceses, which are exempt from the ordinary's jurisdiction, and subject to the metropolitan only. All ecclesiastical causes arising within these peculiar or exempt jurisdictions are originally cognizable by this court; from which an appeal lay formerly to the pope, but now, by the stat. 25 Henry VIII. c. 19. to the king in chancery.

PECULIARITY. *s.* (from *peculiar*.) Particularity; something found only in one (*Swift*).

PECULIARLY. *ad.* (from *peculiar*.) 1. Particularly; singly (*Woodward*). 2. In a manner not common to others (*Fell*).

PECUNIARY. *a.* (*pecuniarius*, Lat.) 1. Relating to money (*Brown*). 2. Consisting of money (*Bacon*).

PED. *s.* (commonly pronounced *pad*). 1. A small packsaddle (*Tusser*). 2. A basket; a hamper (*Spenser*).

PEDAGOGICAL. *a.* (from *pedagogue*.) Suited or belonging to a schoolmaster.

PEDAGOGUE. *s.* (*παιδαγωγος*.) One who teaches boys; a schoolmaster; a pedant (*Dryden*).

To PEDAGOGUE. *v. a.* (*παιδαγωγῶ*.) To teach with superciliousness (*Prior*).

PEDAGOGY. *s.* (*παιδαγωγία*.) Preparatory discipline (*South*).

PEDAL. *a.* (*pedalis*, Lat.) Belonging to a foot.

PEDALE. (Ital.) In music. An epithet applied to a fixed or stationary bass, during which the superior parts evolve through various independent harmonies.

PEDAL-NOTE. A holding note, during which the harmony formed by the other parts of the composition is allowed to proceed independently.

PEDALS, the largest pipes of an organ, so called because played and stopped with the foot. The pedals are made square, and of wood; they are usually 13 in number. They are of modern invention, and serve to carry the sounds an octave deeper than the rest. See **ORGAN**.

PEDALIUM, in botany, a genus of the class didynamia, order angiospermia. Calyx five-parted; corol somewhat ringent, with the border five-cleft; nut corky, four-sided, with spinous angles, two-celled; seeds two. One species; a native of India, with stem simple, and axillary, solitary flowers.

PEDANEUS. *a.* (*pedaneus*, Lat.) Going on foot.

PEDANT. *s.* (*pedant*, Fr.) 1. A schoolmaster (*Dryden*). 2. A man vain of low knowledge (*Swift*).

PEDANTICAL. **PEDA'NTIC.** *a.* (*pedantesque*, Fr. from *pedant*.) Awkwardly ostentatious of learning (*Hayward*).

PEDANTICALLY. *ad.* With awkward ostentation of literature (*Dryden*).

PEDANTRY. *s.* (*pedanterie*, Fr.) Awkward ostentation of needless learning (*Cowley*).

PEDATE, in zoology, deeply cut into segments connected with the petiole on the inner side only, like a bird's foot.

PEDATE LEAF. (*pes*, a foot). In botany. Cum petiolus bifidus latere tantum interiore adnecit foliola plura. When a bifid petiole connects several leaflets on the inside only. This is a species of compound leaf, and bears some resemblance to a bird's foot. It is exemplified in *passiflora*, *arum*, and *helleborus foetidus*. It is applied also to the raceme.

P E D

PEDATIFID LEAF. In botany. This is to pedate, what pinnatifid is to pinnate: the parts of the leaf not being separate; but connected, as in the feet of water fowl. Exemplified in *arum muscivorum*.

To PEDDLE. *v. n.* To be busy about trifles: commonly written *piddle* (*Ainsworth*).

PEDDLING. *a.* Petty-dealing; trifling; unimportant (*Decay of Piety*).

PEDEE, a river of the United States which rises in N. Carolina, and is there called Yadkin river; on entering S. Carolina, it takes the name of Pedee, and flows into Winyaw bay, at Georgetown.

PEDERASTS, the same with Sodomites.

PEDERERO. *s.* (*pedrero*, Span.) A small cannon managed by a swivel. It is frequently written *paterero*.

PEDES HIPPOCAMPI. (*pes*, *pedes*). In anatomy, two columns at the end of the fornix of the brain, which diverge posteriorly. They are so named from their resemblance to the feet of the hippocampus, or sea-horse.

PEDESTAL. *s.* (*pedestal*, Fr.) The lower member of a pillar; the basis of a statue (*Add*).

PEDESTRIOUS. *a.* (*pedestris*, Lat.) Not winged; going on foot (*Brown*).

PEDIÆAN, in Grecian antiquity. The city of Athens was anciently divided into three different parts; one on the descent of an hill; another on the sea-shore; and a third in a plain between the other two. The inhabitants of the middle region were called *παιδαί*, *Pediæans*, formed from *παιδιον*, plain, or flat; or, as Aristotle will have it, *Pediaci*: those of the hill, *Diacrians*; and those of the shore, *Paraliens*. These quarters usually composed so many different factions. Pisistratus made use of the *Pediæans* against the *Diacrians*. In the time of Solon, when a form of government was to be chosen, the *Diacrians* chose it democratic; the *Pediæans* demanded an aristocracy; and the *Paraliens* a mixed government.

PEDICEL, or **PEDICLE**, in botany. In Philos. Botan. it is interpreted—*pedunculus partialis*, a partial peduncle. But in Delin. Pl. a partial peduncle is a subdivision of a common peduncle, supporting a few flowers. The genuine notion of a pedicel is, that it supports one flower only where there are several on a peduncle; or, it is the ultimate subdivision of a common peduncle, immediately connected with the flower itself.

PEDICELLARIA, in zoology, a genus of the class vermes, order molusca. Body soft and seated on a rigid fixed peduncle; aperture single. Three species; all inhabitants of the North Seas, and found in the midst of the spines of echini. *P. globifera* has a spherical head, but no neck; its body is minute and resembles a mucor; the colour of the head is reddish, and has the appearance of a small cherry; peduncle or stem tawny and covered with a gelatinous hyaline skin.

PEDICULAR. *a.* (*pedicularis*, Lat.) Having the phthyriasis or lousy distemper (*Ainsworth*).

PEDICULARIA. (*pedicularia*, from *pedi-*

P E D

culus, a louse; so called from its use in destroying lice.) The herb staves acre. See **STAPHISAGRIA**.

PEDICULARIS. Louse-wort. In botany, a genus of the class didynamia, order angiospermia. Calyx mostly five-cleft, inflated; corol with the upper lip compressed and emarginate; capsule two-celled, mucronate, oblique; seeds few, angular, mucronate. Thirty-four species. Almost all European plants; two common to the marshes or pastures of our own country.

PEDICULUS. Louse. In zoology, a genus of the class insecta, order aptera. Mouth with a retractile, recurved sucker without proboscis; tentacleless; antennae as long as the thorax; eyes two; abdomen depressed; legs six, formed for running. Sixty-six species; about half of them common to our own country, and found on the bodies of man, quadrupeds, birds, and the larger insects. They live by extracting animal juices: the larvae and pupae are six-footed and nimble, resembling the insect in its perfect state. It is highly probable, though not more than sixty-six species have yet been classified, that there is no tribe of quadrupeds or birds that is not infested by a pediculus of its own. Their specific names are derived from the animal they inhabit: hence we have *P. humanus*, *P. suis*, *P. ovis*, *P. anseris*, &c. Man appears to be infested by three distinct species:

1. *P. humanus*. Common louse, with lobed cinereous abdomen, found in the heads and on the garments of such as are naturally uncleanly, especially boys.

2. *P. pubis*. Crab-louse, with chaliciform legs, and the abdomen emarginate behind: found on the groins and eye-brows of uncleanly men.

3. *P. ricinoides*: with reddish body, abdomen orbicular with a white line; scutell three-lobed; and white sucker armed with small hooks beneath. Inhabits America, and gets into the legs of the naked inhabitants, where it draws blood; and depositing its eggs in the wound, occasions foul and malignant ulcers.

Lewenhoeek affirms, that the first of these is, in the male sex, furnished with a sting at the extremity of the abdomen, and that hence proceeds the irritation the animal inflicts. The male is easily distinguished from the female, the tail or tip of the abdomen being rounded in the former, and forked or bifid in the latter. He found that in six days a female will lay fifty eggs; and upon dissecting it after that period, he discovered as many more in the ovary, whence he concluded that in twelve days it would have laid a hundred eggs; these eggs hatching in six days, which he found to be their natural time, would probably produce fifty males and as many females; and these females, attaining their full growth in eighteen days, might each of them be supposed, after twelve days more, to lay also a hundred eggs; which in six days further (the time required to hatch them), might produce a

younger brood of five thousand; so that in eight weeks a single insect might see five thousand of its own descendants.

The phthiriasis, or disease of lice, spoken of by Pliny and other ancient writers, referred to in the sacred scriptures, and treated of by medical writers in modern times, does not appear to be produced by insects of this tribe.

PEDIGREE. *s.* (*per* and *dégré*, *Skinner.*) Genealogy; lineage; account of descent.

PEDILUVIUM. (from *pedes*, the feet; and *lavo*, to wash.) A bath for the feet.

PEDIMENT, in architecture, a kind of low pinnacle; serving to crown porticos, or finish a frontispiece; and placed as an ornament over gates, doors, windows, niches, altars, &c.

The pinnacles of the ancient houses, Vitruvius observes, gave architects the first idea of this noble part; which still retains the appearance of its original.

The parts of the pediment are, the tympanum and its cornice. See **ARCHITECTURE**.

PEDLAR, or **PE'DLER.** *s.* (a contraction from *petty-dealer.*) One who travels the country with small commodities (*Shakspeare*).

PEDLERY. *s.* (from *pedler.*) Wares sold by pedlars (*Swift*).

PEDOBAPTISM. *s.* (*παιδος* and *βαπτισμ.*) Infant baptism.

PEDOBAPTIST. *s.* (*παιδος* and *βαπτιστης.*) One that holds or practises infant baptism.

PEDOMETER, or **PODOMETER**, formed from *πες*, *pes*, foot; and *μετρον*, measure, way-wiser; a mechanical instrument, in form of a watch, consisting of various wheels with teeth, catching in one another, all disposed in the same plane; which, by means of a chain or string fastened to a man's foot, or to the wheel of a chariot, advance a notch each step, or each revolution of the wheel; so that the number being marked on the edge of each wheel, one may number the paces, or measure exactly the distance from one place to another. There are some of them which mark the time on a dial-plate, and are in every respect much like a watch, and are accordingly worn in the pocket like a watch.

Figs. 5, 6, and 7, plate 129, serve to illustrate the mechanism and principle of one of Spencer and Perkins's ingenious pedometers, which when worked in the pocket ascertains the number of steps made by the wearer. The external appearance, fig. 5, is somewhat like that of a watch: in the place of the watch-chain is a brass lever *A*, figs. 5 and 7, one end of which is bent into a hook; the other has a hole *a* through it, as shown in fig. 6, and has a cleft cut in it through the hole; through this hole a wire passes, which wire is fixed between the two studs *b b*, figs. 5 and 7, so as to turn round freely; it also goes through the two arms of the piece *B*, fig. 6, and is made fast to them so that they turn with it the arm *x*, which is higher than the other, and has a narrow opening cut in it, into which is jointed a piece of steel *D* by a pin through its top; the end of the lever *A* has two small screws in it so as to

close up the hole *a*, and pinch the wire which passes through the hole tight. When the lever *A* is moved backwards and forwards, it turns the wire by friction, and moves the piece *B* up or down till it is stopped by its leaf *d* coming either against the under side of the dial, or against the back of the case, as shown in fig. 7; the lever then slips round the pin. When the piece *B* is moved up or down, it pushes or pulls the piece *D* in or out of the case: the end of this is in two branches *e f*; the latter ends in the plain point, the other is bent into a hook; these branches take on each side of a small ratchet wheel, in fig. 7; which has 10 teeth. When the lever *A* is moved so as to draw back the piece *D*, the hook *e* takes one of the teeth of the ratchet wheel *n*, and moves it round one tooth: at the same time the point *f* slips over the sloping side the opposite tooth, and when the piece *D* is pushed in, it also moves the wheel round one tooth in the same direction as while the hoof *e* slips over the teeth ready for the next movement. The ratchet *m* has a pinion of six teeth on its under side, which tacks into a wheel *n* of 60 teeth; on the spindle of this wheel (which projects through the dial) is fastened the long hand *i*, fig. 5. As the wheel *m* makes one revolution for ten strokes of the lever *A*, and its pinion has one-tenth of the number of teeth in the wheel *n*, it is evident that 100 strokes of the lever will be required for one revolution of the wheel *n*, and hand *i*. The wheel *n* has a pinion of six leaves on it, which gives motion to a wheel *o* of 60 teeth, which turns *r* of 60 teeth, on whose about the hand *t*, fig. 5, is fastened: the wheel *o* has a pinion of six leaves on the under side of it, which moves a wheel *y* of 72 teeth, which carries the hand *s*, fig. 1; by this arrangement the hand *t* will turn once round for 1000 strokes of the lever *A*; its dial is divided into 10 each, answering to 100, or 1 revolution of the hand *t*. The index *s* will turn round once for 1200 strokes of the lever; and its circle is divided into 12 parts, each of which denotes one revolution of the hand *t*, or 100 strokes of the lever; the hands are not fastened to their spindle, but can be turned round to set them all to *O* when it is going to be used. The best method of placing the machine, is with a case upon the thigh, the lever *A* brought towards the button of the waistband, and if possible, the joints of the lever over the joints of the thigh; so that the lever being over the belly, is at rest, while the motion of the thigh moves the case part of the machine at every step. Set all the hands to *O*; and when 100 paces are walked, the long hand will have made one revolution, and the hand will move to the figure 1, and so on as before described. Persons of middle stature are found to make about 1000 paces in a mile; but it is best to walk a mile several times, observing each time by the machine, the number of paces each time, and the average of these will serve to calculate by.

PEDRAZA, a town of Spain, in Old Castile, with a castle. It is the birth-place of the

Fountain Pen?

Multon, & Puffell Co.

P E D

emperor Trajan, and stands on the Cega, near its source, 25 miles N.E. of Segovia.

PEDRO POINT, the most northern point of the island of Ceylon, opposite Point Calymere, on the continent of Hindustan. Lon. 80. 27 E. Lat. 9. 52 N.

PEDRO (St.), one of the islands in the Pacific ocean, called Marquesas. Lon. 138. 51 W. Lat. 9. 58 S.

PEDUNCLE. (from *pedo*, *pedare*, the same with *fulcire*, or prop or support, and not as Dr. Berkenhout derives it from the noun *pedo*, splay-footed.) A peduncle. By older writers called the foot-stalk; by several moderns the fruit-stalk. To the first of these we object, because we have then the same term for the support of the fructification and of the leaf: to the second, because the peduncle being the support of the flowers as well as the fruit, we are reduced to the absurdity of saying a many-flowered fruit-stalk. To both we object, because peduncle is generally received, and is intelligible in every nation where botany is studied.

The peduncle is the fulcrum of the fructification, or a partial stem supporting that only. The explanation in Philos. Bot. is thus expressed: *truncus partialis elevans fructificationem, nec folia*. In Delin. Pl. thus: *fulcrum sustinens fructificationem*. In Regn. Veget. it is said to be *ramus caulis floriferus*; a flower-bearing branch from the stem. The last is the least accurate of the three, and wants the exclusion of the leaves as in the first.

Ray and other old writers use the classical term *pediculus*. Linnæus probably changed it for *pedunculus*, because the former signified a sort of insect, as well as the little stalk that supports a fruit.

With respect to its place, a peduncle may be,

1. Radical, or proceeding immediately from the root: as in the primrose.
2. Cauline, or proceeding from the stem.
3. Ramous, or proceeding from a branch. These may be called in English, a root-peduncle; a stem-peduncle; a branch-peduncle.
4. Petiolar, or proceeding from the petiole.
5. Cirriferous, or tendril-bearing.
6. Terminal, or proceeding from the top of the stem.
7. Axillary, or proceeding from the angle made by the leaf and stem, or the branch and stem.

8. Opposite-leaved.

9. Lateral flowered, or having the flower on the side of it.

10. Interfoliaceous, or rather among the leaves. I rather think that this is a mistake for, perhaps, intrafoliaceous, within the leaf.

11. Extrafoliaceous. Without, or on the outside of the leaf.

12. Suprafoliaceous. Inserted into the stem higher than the leaf or its petiole.

With respect to its direction, a peduncle may be,

1. Pressed close to the stem.
2. Upright.

P E E

3. Spreading.

4. Drooping. Pointing to the ground.

5. Upside down.

6. Bowed or curved downwards.

7. Nodding. Curved downwards more than in n. 6. but less than in n. 4.

8. Rising gradually.

9. Weak, so as to bend with the weight of the flower.

10. Pendulous or loose, so as to tend downwards with the leaf.

11. Stiff and straight.

12. Flexuous, or bending this way and that.

13. Bent backwards as if broken.

With respect to their situation, peduncles may be,

1. Opposite to each other; or, 2. Alternate.

3. Scattered; without any regular order.

4. Verticillate, or in whorls.

With respect to their number, they may be,

1. Solitary or single.

2. Double; two together, or in pairs.

In an umbellule there are several equal peduncles diverging from the same point or centre.

According to the number of flowers which a peduncle bears, it is called uniflorous, biflorous, triflorous, &c. and multiflorous. One, two, three-flowered, and many-flowered.

With respect to its measure, a peduncle is,

1. Short, very short.

2. Long, very long.

With respect to its structure, a peduncle is,

1. Round, cylindric, or rather columnar.

2. Triquetrate. Three-sided.

3. Tetragonous. Four-cornered.

4. Filiform. Like a thread. Of the same thickness in all its parts.

5. Attenuate. Tapering gradually towards the top.

6. Incrassate. Growing gradually thicker towards the top.

7. Clavate. Club-shaped. Thick at the end.

8. Nude, or naked.

9. Squamous. Scaly.

10. Foliate, or leafy.

11. Bracteate, or furnished with bractes.

12. Geniculate, or kneed. Bent at the joints.

13. Articulate, or jointed.

PEDUNCULAR. Growing from a peduncle: as same tendrils do.

PEDUNCULATE. Flower or whorl: in opposition to one that is close to the stem, sessile.

PEEBLES, a borough of Scotland, capital of Peebleshire, seated on the Tweed, over which is an elegant bridge. It has manufactures of carpets and serges, and is noted for its excellent beer. On a projecting rock, near the Tweed, stands Nidpath castle; and on an eminence on the E. stands Horseburg castle. It is 22 miles S. of Edinburg. Lon. 3. 7 W. Lat. 55. 40 N.

PEEBLESHIRE, a county of Scotland, 30 miles long and 12 broad; bounded on the N.

by Edinburghshire, E. by Selkirkshire, S. by Dumfriesshire, and W. by Lanerksire. It is divided into 16 parishes; and the number of inhabitants in 1801 was 8735. In this county there is not much arable land. Its hills (among which are those of Tweedsmuir) abound with salubrious springs, and feed numbers of sheep and cattle. The principal rivers are the Tweed and Lynne.

PEEK, in the sea language, is a word used in various senses. Thus the anchor is said to be a-peek, when the ship being about to weigh, comes over her anchor in such a manner that the cable hangs perpendicularly between the hawse and the anchor. To heave a-peek, is to bring the peek so that the anchor may hang a-peek. A ship is said to ride a-peek, when lying with her main and fore-yards hoisted up, one end of her yards is brought down to the shrouds, and the other raised up on end; which is chiefly done when she lies in rivers, lest other ships falling foul of the yards should break them. Riding a broad peek, denotes much the same, excepting that the yards are only raised to half the height. Peek is also used for a room in the hold, extending from the bits forward to the stem: in this room men of war keep their powder, and merchantmen their victuals.

PEEL, a town on the W. coast of the isle of Man, situate on a spacious bay. At the S. extremity of the bay is Peel Isle, a rock of great magnitude and height, on the summit of which is a castle, and the cathedral of the isle, dedicated to St. Germain, the first bishop, who lived in the fifth century. The town is much decayed, and the inhabitants are indolent and poor. Lon. 4. 40 W. Lat. 54. 13 N.

To PEEL. *v. a.* (*peler*, Fr. from *pellis*, Lat.) 1. To decorticate; to flay (*Shakspeare*). 2. (from *pill*, Fr. to rob.) To plunder. According to analogy this should be written *pill*.

PEEL. *s.* (*pellis*, Latin; *pelure*, Fr.) The skin or thin rind of any thing.

PEEL. *s.* (*paelle*, Fr.) A broad thin board with a long handle, used by bakers to put their bread in and out of the oven.

PEELE (Francis), a dramatic writer in the reign of queen Elizabeth, a native of Devonshire; was a student of Christ Church college, Oxford, in 1573, where he took his degree of M. A. in 1579. He was a good pastoral poet, and Wood informs us, that his plays were acted with great applause.

PEE'LER. *s.* (from *peel*.) 1. One who strips or flays. 2. A robber; a plunderer (*Tusser*).

To PEEP. *v. n.* 1. To make the first appearance (*Spenser*). 2. To look slyly, closely, or curiously; to look through any crevice (*Cleaveland*).

PEEP. *s.* 1. First appearance: as, at the peep of day. 2. A sly look (*Swift*).

PEEPER. *s.* Young chickens just breaking the shell (*Bramstead*).

PEEPHOLE. PEEPINGHOLE. *s.* (peep and hole.) Hole through which one may look without being discovered (*Prior*).

PEER. *s.* (*pair*, French.) 1. Equal; one of the same rank (*Davies*). 2. One equal in excellence or endowments (*Dryden*). 3. Companion; fellow (*Ben Jonson*).

PEERS, in our common law, are those who are impannelled in an inquest upon any man, for the convicting or clearing him of any offence, for which he is called in question; and the reason is, because the course and custom of our nation is, to try every man in such a case by his equals, or peers.

PEERS OF THE REALM, are the nobility of the kingdom, and lords of parliament: who are divided into dukes, marquises, earls, viscounts, and barons; and the reason why they are called peers is, because notwithstanding there is a distinction of dignities in our nobility, yet in all public actions they are equal, as in their votes of parliament, and in passing upon the trial of any nobleman.

It seems clearly, that the right of peerage was originally territorial; that is, annexed to lands, houses, castles, &c.; the proprietors and possessors of which were, in right of those estates, allowed to be peers of the realm, and were summoned in parliament to do suit and service to their sovereign; and when the land was alienated, the dignity passed with its appendant. Thus the bishops still sit in the house of lords, in right of succession to certain ancient baronies annexed, or supposed to be annexed, to their episcopal lands. But afterwards, as alienations grew frequent, the dignity of peerage was confined to the lineage of the party ennobled; and instead of territorial, became personal. Actual proof of a tenure of barony became no longer necessary to constitute a lord of parliament; but the record of the writ of summons to him, or his ancestors, was admitted as a sufficient evidence of the tenure.

Peers are now created either by writ or patent; for those who claim by prescription must suppose either a writ or patent made to their ancestors, though by length of time it may be lost. The creation by writ or the king's letter, is a summons to attend the house of peers, by the style and title of that barony which the king is pleased to confer; that by patents is a royal grant to a subject of any dignity and degree of peerage. The creation by writ is the more ancient way; but a man is not ennobled by it unless he actually takes his seat in the house of lords, and therefore the most usual, because the surest way, is to grant the dignity by patent, which ensures to a man and his heirs, according to the limitations thereof, though he never himself makes use of it. 1 Black. 399.

In criminal cases a nobleman is tried by his peers. Peers shall have the benefit of clergy for the first offence of felony without being burned in the hand.

PEERS (House of). See PARLIAMENT.

To PEER. *v. n.* (by contraction from *appeal*.) 1. To come just in sight (*Ben Jonson*). 2. To look narrowly; to peep (*Sidney*).

PEERAGE. *s.* (*pairie*, Fr. from *peer*.)

1. The dignity of a peer (*Swift*). 2. The body of peers (*Dryden*).

Accounts of the peerage of Great Britain, with genealogy, arms, &c. have been published by Kearsley and Stockdale.

PEERIDOM. *s.* (from *peer*.) Peerage.

PEERESS, a woman who is noble by descent, creation, or marriage. For, as we have noblemen of several ranks, so we may have noblewomen: thus king Henry VIII. made Anne Bullen marchioness of Pembroke; king James I. created the lady Compton, wife to sir Thomas Compton, countess of Buckingham, in the lifetime of her husband, without any addition of honour to him. The same king made the lady Finch viscountess of Maidstone, and afterwards countess of Winchelsea, to her and the heirs of her body: and king George I. made the lady Schulenberg duchess of Kendal. If a peeress, by descent or creation, marries a person under the degree of nobility, she still continues noble: but if she obtains that dignity only by marriage, she loses it on her afterwards marrying a commoner; yet, by the courtesy of England, she generally retains the title of her nobility. A countess or baroness may not be arrested for debt or trespass; for though, in respect of their sex, they cannot sit in parliament, they are nevertheless peers of the realm, and shall be tried by their peers, &c.

PEERLESS. *a.* (from *peer*.) Unequalled; having no peer (*Milton*).

PEERLESS PRIMROSE, in botany. See NARCISSUS.

PEERLESSNESS. *s.* (from *peerless*.) Universal superiority.

PEEVISH. *a.* (from *beeish*, *Skinner*.) 1. Petulant; waspish; easily offended; irritable; soon angry; hard to please (*Swift*). 2. Expressing discontent or fretfulness (*Shakspeare*).

PEEVISHLY. *ad.* Angrily; querulously; morosely (*Hayward*).

PEEVISHNESS. *s.* Irascibility; querulousness; fretfulness; perverseness (*King Charles*).

PEEWIT, in ornithology. See LARUS.

PEG. *s.* (*pughe*, Teutonic.) 1. A piece of wood driven into a hole (*Swift*). 2. The pins of an instrument in which the strings are strained (*Shakspeare*). 3. To take a PEG lower. To depress; to sink (*Hudibras*). 4. The nickname of Margaret.

To PEG. *v. a.* To fasten with a peg (*Evel*).

PEGANUM. In botany, a genus of the class didecandria, order monogynia. Calyx five-leaved, or leafless; corol five-petalled; capsule three-celled, three-valved, many-seeded. Four species: Spain, Palestine, Siberia.

PEGASUM STAGNUM, a lake near Ephesus, which arose from the earth, when Pegasus struck it with his foot.

PEGASUS, among the poets, a winged horse sprung from the blood of Medusa, when Perseus had cut off her head. He received his name from his being born, according to Hesiod, near the sources (*πηγῆς*) of the ocean. As soon as he was born, he flew up into heaven, or rather, according to Ovid, fixed

his residence on mount Helicon, where, by striking the earth with his foot, he instantly raised a fountain, thence called Hippocrene. He became the favourite of the Muses, and being tamed by Neptune or Minerva, he was given to Bellerophon to conquer the Chimæra. This monster being destroyed, Pegasus threw down his rider, because he attempted to fly to heaven. Pegasus, however, continued his flight up to heaven, and was placed among the constellations by Jupiter.

PEGASUS. In natural history, a genus of the class pisces, order branchiostega. Mouth beneath; snout retractile; upper jaw elongated, denticulate, ensiform, linear; aperture of the gills single, before the pectoral fins; body compressed downwards, articulate with bony incisions, and mailed; ventral fins behind the pectoral. Three species: 1. *P. draconis*. Dragon-pegasus. Snout conic: inhabits India; from three to four inches long; feeds on worms, the spawn of other fishes and fat earth; body above blueish, with brown, radiate tubercles; beneath broad with a longitudinal eminence in the middle, on which are seated the ventral fins.

2. *P. volans*. Snout ensiform, denticulate; about three inches long: inhabits India.

3. *P. natans*. Snout ensiform, unarmed. Inhabits India: size of *P. draconis*; body broad on the fore-part, and narrowed behind, above yellow-brown, beneath broad, smooth, white. See Nat. Hist. Pl. CLXX.

PEGASUS. In astronomy, the name of a constellation of the northern hemisphere, figured in form of a flying horse. The stars in this constellation in Ptolemy's Catalogue are twenty, in Tycho's nineteen, in Hevelius's thirty-eight, in the Britanic Catalogue eighty-nine, viz. 0, 3, 3, 8, 12, 63.

PEGEMUS, one of the many names by which the chemists have called mercury.

PEGMA. Among the Romans, a wooden machine, used in theatrical entertainments, which was raised and let down by secret engines, whence it was said to grow. See PEGMATES.

PEGMATES, or rather PEGMARES. In antiquity, a name given to certain gladiators, as well as artificers among the Romans. The ancients sometimes exhibited shows of a sort of moving machines, call pegmata: these were scaffolds variously adorned, somewhat after the manner of those now raised for fire-works. These scaffolds, being made to play, and rise aloft, either threw up into the air the matters wherewith they were charged; and, among the rest, men, who were thus sacrificed to afford the people diversion; or else they precipitated them into holes dug in the ground, where they lighted their funeral piles; or finally into the dens of wild beasts. Both the miserable people thus sacrificed, and the workmen that made and played the machine, were called pegmates, or pegmares.

PEGNAFIEL, a town of Spain, in Old Castile, remarkable for its palace, castle, and fortifications; and its cheeses are said to be the best

in Spain. It is seated on the Douero, 20 miles S.E. of Valladolid. Lon. 4. 0 W. Lat. 41. 41 N.

PEGNA MACOR, a town of Portugal, in Beira, with a castle, 40 miles N.W. of Alcantara. Lon. 6. 32 W. Lat. 39. 50 N.

PEGNARANDA, a town of Spain, in Old Castile, 30 miles S.W. of Olmedo. Lon. 4. 8 W. Lat. 40. 59 N.

PEGOMANTIA. (Πεγομαντία.) In antiquity, a species of divination, which was performed with fountain water. See HYDROMANCY.

PEGU, a kingdom of Asia, lying to the S.E. of Bengal. It is bounded on the N. by Burmah, on the W. and S. by the ocean, and on the E. by Laos and Siam. Its products are timber for building, elephants, elephants teeth, bees'-wax, lac, saltpetre, iron, lead, tin, petroleum, very fine rubies, small diamonds, and plenty of lead, of which they make their money. It is very fruitful in corn, roots, pulse, and fruits. The government is arbitrary, for the king's will is a law, and yet he does not often abuse his power. The inhabitants are but thinly clad, and the best among them wear neither shoes nor stockings. The women are much fairer than the men, small but well proportioned. If the wife proves false, the husband may sell her for a slave; and if he go astray, she will give him a dose of poison. There are a vast number of temples in this country, mostly of wood, varnished and gilt. The priests have ground allowed them, which they cultivate for their subsistence; and they are said to be strict observers of morality. They are called talapoins, and inculcate charity as the highest virtue; affirming that religion to be the best which teaches men to do the most good. They have idols in their temples, in a sitting posture, cross-legged, and with very large ears. They have various sorts of music, but the pipe and tabor are esteemed the best. In the low flat part of the country, which is liable to be overflowed, the houses are built upon stakes, and in time of inundations, the inhabitants communicate with each other by boats. Pegu was an independent kingdom, till 1751, when it was reduced, by the king of Burmah, to the state of a dependant province.

PEGU, a town in the kingdom of the same name, above 20 miles in circumference; but not one twentieth part is inhabited, for it was ruined by the king of Burmah. It is seated on a river of the same name, 520 miles S. of Ava. Lon. 96. 30 E. Lat. 18. 10 N.

PEINE, a town of Lower Saxony, in the duchy of Brunswick; famous for a battle fought in 1553, when Maurice, elector of Saxony, and the margrave of Brandenburg were killed. It is 17 miles W. of Brunswick. Lon. 10. 19 E. Lat. 52. 25 N.

PEINE FORT ET DURE, (Lat. *pæna fortis et dura*), signifies a special punishment inflicted on those who, being arraigned of felony, refuse to put themselves on the ordinary trial, but stubbornly stand mute; it is vulgarly called pressing to death. See ARRAIGNMENT.

PEIRCE (James), an eminent dissenting minister, was born at Wapping, in London, in the year 1674, and was educated at Utrecht and Leyden; after which he spent some time at Oxford, in order to enjoy the benefit of frequenting the Bodleian library. He then for two years preached the Sunday-evening's lecture at the meeting-house in Miles-Lane, London, and then settled at Cambridge. In 1713 he was removed to a congregation at Exeter, where he continued till the year 1718; when the Calvinists among the dissenters proposing a subscription to articles of faith to be signed by all the dissenting ministers in the kingdom, several articles were proposed to him and Mr. John Hallet, another dissenting minister at Exeter, in order to their subscribing them. They both refused, imagining this proceeding of their dissenting brethren to be an unworthy imposition on religious liberty and private judgement; for which they were ejected from their congregation. Upon this, a new meeting was opened for them at Exeter, of which Mr. Peirce continued minister till his death, in 1726. He was a man of the strictest virtue, exemplary piety and great learning. He wrote, 1. *Exercitatio philosophica de Homocemeria Anaxagorea*. 2. Thirteen pieces on the Controversy between the Church of England and the Dissenters. 3. Ten pieces on the Controversy about the Ejection at Exeter. 4. Six pieces on the Doctrine of the Trinity. 5. A Paraphrase and Notes on the Epistles of St. Paul to the Colossians, Philippians, and Hebrews. 6. An Essay in favour of giving the Eucharist to Children. 7. Fourteen Sermons.

PEIRESC (Nicolas Claude Fabri), descended from an ancient family of Pisa, in Italy, and born in 1580. He spent five years in study at the jesuits' college, and became famous for his discoveries in antiquities, particularly in medals. He went to Rome in 1600, and staid six months in that capital, as well to view the jubilee as to inspect the monuments of the fine arts; after which he returned to Padua, where he consulted the learned Rabbi Solomon, upon the Hebrew, Samaritan, Syriac, and Arabic languages. His knowledge of the Greek was considerable, and his proficiency in mathematics procured him the friendship of Galileo and Fabricius of Aquapendente. Upon his obtaining the degree of LL. D. at Aix, in 1604, he made a learned speech on the antiquity of the doctorial ornaments. In 1606 he accompanied the French ambassador to England. He died of a suppression of urine, in 1637. His works were numerous, at the head of which stands his *Historia Provinciæ Galliæ Narbonensis*, and the last on the catalogue *Linguae Orientales*, &c.

PEISHORE, or PISHOUR, a considerable city of Hindustan Proper, in the province of Cabul. It is subject to the king of Candahar, and is 50 miles N.W. of Attock. Lon. 96. 54 E. Lat. 32. 44 N.

PEITZ, a town of Upper Saxony, in the Ucker marche of Brandenburg. In the neighbourhood are iron mines, and manufactures of pitch and turpentine. It is 30 miles S.S.W.

of Frankfort on the Oder. Lon. 8. 35 E. Lat. 52. 5 N.

PEKAN, in mastiology. See MUSTELA.

PEKING, the capital of the empire of China, in the province of Pe-tche-li. Its name signifies the Northern Court, to distinguish it from Nan-king, the Southern Court, where the emperor formerly resided. This capital forms an oblong square, and is divided into two cities; one inhabited by Chinese, the other by Tartars. These two cities, exclusive of the suburbs, are nearly 14 miles in circumference. The walls of the city are 28 feet high, 24 thick at the base, and 12 at the top; and there are spacious towers at 70 feet distance from each other. The gates are high, and well arched, supporting buildings of nine stories high; the lowest of which is for the soldiers when they come off guard: they are nine in number, three in the S. wall, and in each of the other sides two. The middle gate, on the S. side, opens into the Tartar or imperial city, which is a space within the general inclosure, about a mile from N. to S. and three-fourths of a mile from E. to W. with a rivulet winding through it. A wall of large red polished bricks, 20 feet high, covered with a roof of tiles painted yellow and varnished, surrounds this space, in which are contained the imperial palace and gardens, the public offices, lodgings for the ministers, the eunuchs, artificers, and tradesmen belonging to the court. Between the other two gates in the S. wall, and the opposite ones on the N. side of the city, run two straight streets, each four miles in length, and 120 feet wide. One street of the same width runs from one of the eastern to the corresponding western gate, but the other is interrupted by the imperial city, round the walls of which it is carried. The other streets branch from these main streets at right angles, and are very narrow. The houses have no windows nor openings to the street, except the great shops; most of them are poorly built, and have only a ground-floor. It is astonishing to see the concourse of people that are in the main streets, yet not one Chinese woman among them, and the confusion occasioned by the number of horses, camels, mules, asses, wagons, carts, and chairs; without reckoning the several mobs which gather about the jugglers, ballad-singers, &c. Persons of distinction have always a horseman to go before them and clear the way. All the great streets are guarded by soldiers, who patrol night and day with swords by their sides, and whips in their hands, to chastise those who make any disturbance, or take them into custody. The little streets have lattice gates at their entrance into the great streets, which are shut up at night, and guarded by soldiers, who suffer no assemblies in the streets at that time. The emperor's palace and garden occupies two thirds of the Tartar city, is surrounded by a brick wall, two miles in length, with pavilions at each corner encompassed by galleries, supported by columns: the architecture of the stupendous pile of buildings of which the palace consists is entirely different from that of the

Europeans; and they are covered with tiles of a shining beautiful yellow. The temples and the towers of Peking are so numerous, that it is difficult to count them. Provisions of all kinds are exceedingly plentiful, they being, as well as the merchandise, brought from all parts by canals from the rivers, and always crowded with vessels of different sizes; and within the walls are several hundred acres of land under cultivation. An earthquake which happened here, in 1731, buried above 100,000 persons in the ruins of the houses. The inhabitants are estimated at 2,000,000. A Russian church is established here, with a seminary, in which the students are permitted to reside for the purpose of learning the Chinese language. Since this establishment, many interesting publications have appeared at Petersburg, relative to the laws, history, and geography of China, translated from the originals published at Peking. This city stands in a fertile plain, 60 miles S. of the great wall. Lon. 116. 27 E. Lat. 39. 54 N.

PELAGIANS, a christian sect who appeared about the fifth or end of the fourth century. They maintained the following doctrines: 1. That Adam was by nature mortal, and, whether he had sinned or not, would certainly have died. 2. That the consequences of Adam's sin were confined to his own person. 3. That new-born infants are in the same situation with Adam before the fall. 4. That the law qualified men for the kingdom of heaven, and was founded upon equal promises with the gospel. 5. That the general resurrection of the dead does not follow in virtue of our Saviour's resurrection. 6. That the grace of God is given according to our merits. 7. That this grace is not granted for the performance of every moral act; the liberty of the will, and information in points of duty, being sufficient, &c. The founder of this sect was

PELAGIUS, a native of Great Britain; but whether of England, Scotland, or Wales, is as uncertain as it is immaterial. He was born towards the close of the fourth century, and educated in the monastery of Banchor, in Wales, of which he became a monk, and afterwards abbot. In the early part of his life he went over to France, and thence to Rome, where he had the insolence to promulgate certain opinions somewhat different from those of the infallible church. His morals being irreproachable, he gained many disciples; and the dreadful heresy made so rapid a progress, that, for the salvation of souls, it became necessary for the pope to exert his power. Pelagius, to avoid the danger, in the year 409 passed over to Sicily, attended by his friend and pupil Celestius. In 411 they landed in Africa, continued some time at Hippo, and were present at the famous conference between the Catholics and Donatists, which was held at Carthage in 412. From thence they travelled to Egypt, and from Egypt, in 415, to Palestine, where they were graciously received by John, bishop of Jerusalem. In the same year Pelagius was cited to appear before a council of seventeen

bishops, held at Diospolis. They were satisfied with his creed, and absolved him of heresy. The African bishops, however, being displeased with their proceedings, appealed to the Roman pontiff: he first approved, and afterwards condemned, the opinions of Pelagius, who, with his pupil Celestius, was publicly excommunicated; and all the bishops who refused to subscribe the condemnation of the Pelagian heresy were immediately deprived. What became of him after this period is entirely unknown; but it seems very probable that he retired to Banchor, and died abbot of that monastery. He wrote, 1. *Expositiōum in epist. Paulinas*, lib. xiv. 2. *Epistolā ad Demetriadem de virginitate*. 3. *Explanationis symboli ad Damasum*. 4. *Epistolæ ad viduam dūæ*. 5. *De libero arbitrio*. These and many other fragments are scattered among the works of St. Jerome. They are also collected by Garnerius, and published in *Append. Op. Mercatoris*, p. 373. *Cave*.

PELAGIUS I. (Pope). He was a Roman by birth, and ascended the papal chair in 555. He endeavoured to reform the manners of the clergy; and when the city was besieged by the Goths, he obtained from Totila, their general, many concessions in favour of the citizens. He died in 560.

PELAGIUS II. (Pope). He was elected after the death of Benedict I. in 578. He laboured earnestly, but without success, to reconcile the bishops of Istria and Venice to the Roman see; and he opposed John, patriarch of Constantinople, who had assumed the title of oecumenical bishop. Pelagius died of the plague which desolated Rome in 590.

PELAGNISI, an island in the Grecian Archipelago, about eight miles in circumference. Lon. 24. 12 E. Lat. 39. 30 N.

PELAGRA. The disease called the pelagra does not appear to have been noticed by any of our nosologists. Indeed few accounts of it have hitherto been published, although the peculiar symptoms with which it is attended, and the fatal consequences which generally ensue from it, render it equally curious and important. In certain districts, as Milan and Padua in Italy, where it is peculiarly prevalent, it is computed to attack five inhabitants out of every hundred. The following account of this singular disease is extracted from Dr. Jansen's treatise on the subject, who had seen the disease at Milan.

About the month of March or April, when the season invites the farmers to cultivate their fields, it often happens that a shining red spot suddenly arises on the back of the hand, resembling the common erysipelas, but without much itching or pain, or indeed any other particular inconvenience. Both men and women, girls and boys, are equally subject to it. Sometimes this spot affects both hands, without appearing on any other part of the body. Not uncommonly it arises also on the shins, sometimes on the neck, and now and then, though very rarely, on the face. It is sometimes also seen on the breasts of women, where they are

not covered by the clothes, but such parts of the body as are not exposed to the air are very seldom affected; nor has it ever been observed to attack the palm of the hand, or the sole of the foot. This red spot elevates the skin a little, producing numerous small tubercles of different colours; the skin becomes dry and cracks, and the epidermis sometimes assumes a fibrous appearance. At length it falls off in white furfureous scales; but the shining redness underneath still continues, and in some instances remains through the following winter. In the mean time, excepting this mere local affection, the health is not the least impaired, the patient performs all his rural labours as before, enjoys a good appetite, eats heartily, and digests well. The bowels are generally relaxed at the very commencement of the disease, and continue so throughout its whole course. All the other excretions are as usual; and, in females, the menses return at their accustomed periods, and in the proper quantity. But what is most surprising is, that in the month of September, when the heat of the summer is over, in some cases sooner, in others later, the disorder generally altogether disappears, and the skin resumes its natural healthy appearance. This change has been known to take place as early as the latter end of May or June, when it has only been in its earliest stage. The patients, however, are not now to be considered as well; the disease hides itself, but is not eradicated; for no sooner does the following spring return, but it quickly reappears, and generally is accompanied with severer symptoms. The spot grows larger, the skin becomes more unequal and hard, with deeper cracks. The patient now begins to feel uneasiness in his head, becomes fearful, dull, less capable of labour, and much wearied with his usual exertions. He is exceedingly affected with the changes of the atmosphere, and impatient both of cold and heat. Nevertheless, he generally gets through his ordinary labour, with less vigour and cheerfulness indeed than formerly, but still without being obliged to take to his bed; and, as he has no fever, his appetite continues good, and the chylopoietic viscera perform their proper functions. When the pelagra has even arrived at this stage, the returning winter, nevertheless, commonly restores the patient to apparent health; but the more severe the symptoms have been, and the deeper root the disease has taken, the more certainly does the return of spring produce it with additional violence. Sometimes the disease in the skin disappears, but the other symptoms remain notwithstanding. The powers both of the mind and body now become daily more enfeebled; peevishness, watchings, vertigo, and at length complete melancholy supervene. Nor is there a more distressing kind of melancholy any where to be seen than takes place in this disease. "On entering the hospital at Legnano," says Dr. Jansen, "I was astonished at the mournful spectacle I beheld, especially in the women's ward. There they all sat, indolent, languid, with downcast looks,

their eyes expressing distress, weeping without cause, and scarcely returning an answer when spoken to; so that a person would suppose himself to be among fools and mad people: and indeed with very good reason; for gradually this melancholy increases, and at length ends in real mania.

"Many, as I had an opportunity of observing in this hospital, were covered with a peculiar and characteristic sweat, having a very offensive smell, which I know not how better to express than by comparing it to the smell of mouldy bread. A person accustomed to see the disease would at once recognize it by this single symptom. Many complained of a burning pain at night in the soles of the feet, which often deprived them of sleep. Some with double vision; others with fatuity; others with visceral obstructions; others with additional symptoms. Nevertheless, fever still keeps off, the appetite is unimpaired, and the secretions are regularly carried on. But the disease goes on increasing, the nerves are more debilitated, the legs and thighs lose the power of motion, stupor or delirium come on, and the melancholy terminates in confirmed mania. In the hospital at Legnano, I saw both men and women in this maniac state. Some lay quiet; others were raving, and obliged to be tied down to the bed, to prevent them from doing mischief to themselves and others. In almost all these the pulse was small, slow, and without any character of fever. One woman appeared to have a slight degree of *furor uterinus*; for at the sight of men she became merry, smiled, offered kisses, and by her gestures desired them to come towards her. Some were occupied in constant prayers; some pleased themselves with laughter, and others with other things. But it was remarkable, that all who were in this stage of the disease had a strong propensity to drown themselves. They now begin to grow emaciated, and the delirium is often followed by a species of tabes. A colliquative diarrhoea comes on, which no remedy can stop, as also has been observed in nostalgia. Sometimes in the pelagra the diarrhoea comes on before the delirium, and the delirium and stupor mutually interchange with each other. The appetite often suddenly failed, so that the sick will sometimes go for near a week without tasting food. Not uncommonly it returns as suddenly, so that they eagerly devoured whatever was offered them, and this even at times when they are horribly convulsed. The convulsions with which they are attacked are most shocking to see, and are of almost every kind, catalepsy excepted, which has been described by writers. I saw one girl in bed, who was violently distorted by opisthotonos every time she attempted to rise. Some are seized with emprosthotonos; and others with other species of tetanus. At length syncope and death close the tragedy, often without any symptom of fever occurring through the whole course of the disease. The first stage of the pelagra, in which the local affection only takes place, Dr. Jansen observes, continues in some instances for a great length

of time; persons being occasionally met with in whom it has lasted six or eight, or even fifteen years, disappearing regularly every winter, or returning again in the spring. This occasions some of the inhabitants to pay little attention to it; although, in other cases, it reaches its greatest height after the second or third attack. It appears that this disease is not infectious, and that the causes producing it are yet unascertained. It has been supposed by some to arise from the heat of the sun's rays; and hence it is now and then called *mal de sol*; but this does not produce any similar disease in other parts of the world, where it is in an equal or even much greater degree than at Milan; no disease in any respect resembling it having hitherto been noticed in such regions, except the lepra asturiensis described by Thiery, and after him by Sauvages. In this a tremour of the head and trunk of the body takes place, which does not happen in the pelagra. This, however, is the principal difference in the two diseases.

PELARGONIUM. Crane-bill. In botany, a genus of the class monadelphia, order heptandria. Calyx five-parted, the upper division ending in a capillary, nectariferous tube running down the peduncle; petals five irregular; filaments ten unequal, three, and sometimes five of them barren; fruit beaked, separated into five capsules, each tipped with a spiral awn bearded on the inside. A hundred and twenty-three species; one or two natives of Australasia, the rest Cape plants. They must be thus divided into tribes...

- A. Stemless; root rapaceous; umbel compound.
- B. Nearly stemless; root tuberous.
- C. Herbaceous, or somewhat shrubby.
- D. Shrubby; leaves undivided, not angular.
- E. Shrubby; leaves angular, lobed, or palmate.
- F. Shrubby; leaves three-cleft, and ternate.
- G. Shrubby; leaves pinnatifid and pinnate.
- H. Shrubby; leaves decomposed and more than decomposed.

Nearly thirty varieties of this genus are cultivated in our gardens, many of them possessing a flower nearly resembling that of geranium. They may all be increased by seeds sown in pots in kitchen-garden mould in an early part of the spring, and plunged into hot-beds. As they grow up they should be gradually accustomed to the open air, in order to be placed out in it in the summer season in sheltered situations. The shrubby sorts, however, are more commonly increased by cuttings of the young branches, which should be planted in a shady border in the summer, or in pots plunged into a hot-bed; which last is the best method. All are highly ornamental, and afford considerable variety in collections of green-house or pleasure ground plants.

PELASGI, a people of Greece, supposed to be one of the most ancient in the world. They first inhabited Argolis in Peloponnesus, which from them received the name of Pelasgia, and about 1883 years B. C. they passed into Æmo-

nia, and were afterwards dispersed in several parts of Greece. From these different changes of situation in the Pelasgians, all the Greeks are indiscriminately called Pelasgians, and their country Pelasgia, though it should be confined to Thessaly, Epirus, and Peloponnesus. The Pelasgians seem to have received their name from Pelasgus, the first king, and founder of their nation, who was the son of Jupiter and Niobe.

PELATÆ, among the ancient Athenians, were free-born citizens, who were reduced by poverty to the necessity of serving for wages.

PELATO. Salpingius, in myology. See CIRCUMFLEXUS.

PELECANUS. Pelican. In zoology, a genus of the class aves, order anseres. Bill straight, hooked at the point, and furnished with a nail; nostrils an obliterated slit; face nakedish; legs equally balancing the body, all the four toes palmate. Thirty-one species, scattered over the globe; three or four of them common to our own country. These birds are extremely expert at catching fishes with their long bills, and are often tamed for that purpose; they are gregarious and very voracious: the claw of the middle toe is frequently serrate. The following are the chief species:

1. *P. enocrotalus*. White pelican. White; gullet pouched; bill from fifteen to sixteen inches long, red, but when young, yellow; upper mandible depressed, broad, the lower forked; gular pouch flaccid, membranaceous, capable of great distention: irids hazle; gape of the mouth large; head naked at the sides, covered with a flesh-colour skin.

The white pelican is by far the largest bird of this genus, and is even supposed to exceed, in size, the swan, and albatross; but notwithstanding its size, it supports itself easily upon the air, and darts with great rapidity upon its prey; being furnished with such enormous wings, that, when these are extended, the breadth of the bird is from ten to twelve feet. It feeds, like the cormorant, upon fishes which it catches by diving: like the cormorant, too, it is universally spread over all the warm latitudes, of both the old and new continents. In some places, however, pelicans are more numerous than in others; for travellers assert, that the lakes of Judea and Egypt, and the rivers Nile and Strymon, when viewed from the mountains, appear white, with the vast flocks of these birds that continually cover their surface.

They are seen issuing forth to the tracts where fishes abound, every morning, when they continue rising up into the air, and diving into the water, by turns, till they have filled the large bag under their chin. After they have thus collected a sufficient store of provisions, they retire to the cliff of some neighbouring rock, till it is digested. There they remain, slumbering in a profound apathy; till roused in the evening, by the calls of their voracious appetite, they again resume their labours.

As in the other birds of this genus, the four toes of the pelican are all directed forward, and completely palmated; the legs and beak are of a pale red, varying according to the age of the bird. The latter is of the enormous length of eighteen inches; is thick at the base, but tapers off towards the point, where it terminates in a hook. The under mandible consists of two flexible branches, to each of which are attached the sides of that large bag, which extends from the point of the bill to the

throat. This bag, when empty, the bird has a power of contracting into a small size, under the lower chap; when extended, however, it is capable of containing above ten quarts of water, and will admit a man's leg. This extraordinary pouch consists of a skin, covered with a short down, smooth and soft, like silk.

This bag of the pelican may be considered as its crop; for it serves all the purposes of that intestine in other birds: in other birds, it is placed at the bottom; but, in this, at the top of the gullet, where, having less warmth to aid digestion, the food is carried to the young in a more fresh and sound state. In disgorging the food for her family, the mother presses the bottom of her sack upon her breast, and thus discharges its contents; hence the absurd fable of her opening her breast, and feeding her young with her blood.

Nothing can exceed the torpid and indolent habits of these birds, but their gluttony; it is only the powerful stimulation of hunger that will induce them to change their situation, or ascend into the air. They must, however, fly or starve; and when once they stir abroad, they will each devour, at a single meal, as many fishes as would satisfy six men. They commit prodigious devastation, both upon the fresh water and the sea; and will swallow a fish of eight pounds weight. So great is their voracity, that, on a failure of fishes, they will devour rats, and other small quadrupeds.

The indolent habits of the pelican characterize every part of its economy. After its evening labours are over, as if spent with the fatigues of the day, it retires to a tree near the shore, on which it perches all night, and often a great part of the following day, in dismal solemnity, and apparently half asleep. The invincible laziness of the female allows her to make no preparation for incubation, or for the protection of her young, when excluded. She drops her eggs upon the bare ground, to the number of five or six, without seeming to have any choice in the place where they are laid. Her attachment to the place and affection for her young inspire her with no courage in defending her offspring: she tamely sits and suffers her eggs to be taken from under her; and, now and then, only ventures to peck, or cry out, when a person offers to beat her away.

The young, when excluded, are fed with the fishes that have been, for some time, macerated in her bag. They are easily tamed; and, whatever food is given them, they always first commit it to the bag, and afterwards swallow it at their leisure. They are both useless and disagreeable domestics; for their gluttony is insatiable, and their flesh is so unsavory, as to be rejected and despised by the savages. Great numbers are killed, indeed, by the natives of America, for the sake of their bags, which they convert into purses, and tobacco pouches. When carefully prepared, this membra becomes as soft as silk; and is, sometimes, embroiled by the Spanish ladies for work-bags. In Egypt, the sailors use it, while still attached to the two under chaps, for holding water or baling their boats.

2. *P. carbo*. Cormorant, or corvorant. Tail rounded; body black; head subcercated; bill blackish, the base of the lower mandible covered with a yellowish skin, extending under the chin and forming a pouch; irids green, chin white surrounded with a yellowish arch; tail long, lax, feathers fourteen; thighs with a white spot dotted with black; legs black; size nearly that of a goose: the black plumage of the body ornamented, in certain aspects with rich glosses of green and blue.

PELECANUS.

This species has been found by navigators in almost every part of the ocean, where its flesh, although extremely rancid, affords a repast, of which the sailors sometimes gladly partake. The most frequent residence of the cormorant, when on shore, is the high cliffs of those stupendous rocks which hang over the sea, such as the precipices of St. Kilda. There, to the spectator, at the height of three quarters of a mile above the surface of the sea, the vast waves that roll between the new and old world appear like the curl raised on a lake by a gentle breeze. On these tremendous heights, the roaring of the Atlantic is heard like the soft murmurs of a brook; and the cormorant, together with thousands of water-fowls that skim below, seems scarcely so large as a swallow.

The cormorant is, perhaps, the most voracious of all birds, owing to the vast number of worms that fill its intestines, and accelerate the progress of digestion. Spurred on by an insatiable appetite, it dives into the sea like an arrow, and with such well-directed aim, that its prey seldom escapes. It remains under the water sometimes for a considerable time, but seldom appears above its surface, without a fish crosswise in its bill. In order to swallow the fish, when thus caught, it tosses it up into the air, and, with remarkable agility, seizes it by the head, before it reaches the water: in that position, by dilating its throat, it devours a fish apparently much thicker than its own neck.

In England, this bird was formerly domesticated, and trained to fish for its owner. When thus employed, a ring was fastened round its neck, to prevent it from swallowing its prey; and, as often as it caught a fish, it was instructed to carry it to its master. In China, the inhabitants still avail themselves of the service of the cormorant in fishing. One person can manage a great number of them, which he carries out hooded upon the prow of his boat into a lake. On a signal given, they disperse over the lake; and each, according to his success, returns loaded to his master, who receives his booty, and again dispatches him to his employment. When the fisherman has caught what he judges to be sufficient, he calls in his birds, and unties their necks; and either feeds them with a part of what they have taken, or sends them back to fish on their own account.

It is only hunger which gives activity to the cormorant: for, when glutted with food, it is the most dull and indolent of all birds: it will then remain, for five or six hours, without motion, in a state of listless apathy.

3. *P. graculus*. Shag. Sometimes, though erroneously, called crane. Tail rounded; body black, beneath brown; tail-feathers twelve: head and neck black with a green gloss; middle of the belly dusky; legs black. Inhabits northern Europe and Iceland: two and a half feet long.

Another variety found near the Cape, with yellow chin and wedged tail.

A third variety, blackish, beneath brown; feathers above edged with black: inhabits Cayenne, and the Caribbee islands: twenty-six inches long.

The general manners of this variety agree with those of the cormorant; they breed in the same places; and what is a singularity in webfooted birds, both will perch upon and build in trees; both swim with their heads quite erect, and are shot with difficulty, for like the grebes and divers, as soon as they see the flash of a gun they pop under water, and never rise but at a considerable distance.

4. *P. Sula*. Booby. Tail wedged, body whit-

ish; primary quill-feathers tipped with blackish; face red; bill grey, brownish at the base; irids pale-ash; chin bald, yellowish; body beneath white; legs yellowish. Inhabits South America and the neighbouring isles.

These birds are also extremely indolent, and allow themselves to be taken on the rigging of ships, or knocked down with sticks, till a whole flock be massacred to the very last bird. With the same senseless imbecility they abandon themselves to the depredations of the man-of-war bird. These birds no sooner perceive them, than they dive upon them from the air; not to kill them, but with an intention to make them disgorge the fish they may have swallowed. The cowardly booby generally vomits its prey, on the first attack; and again undertakes the task of searching for new spoils, which, when acquired, expose it to new insults from these invaders. Sometimes the booby does not discharge its load upon the first attack, but utters doleful cries, as if calling for help. The man-of-war bird, in this case, still pursues, redoubling his strokes, without relaxation or pity, till the terrified animal disgorges all its fish, which are snatched up by the voracious plunderer, before they reach the water.

The booby most common in the West Indies is of a middle size, between that of a goose and a duck. Its length, from the tip of the bill to that of the tail, is about two feet and an half: its bill is about five inches; and its tail upwards of ten.

5. *P. Aquilus*. Frigate pelican. Tail forked; body and orbits black; bill red. Male: pouch deep red; wing-coverts rufous. Female: belly white. Inhabits within the tropics; three feet long; extent of the wings fourteen feet; builds in trees or rocks, and lays one or two flesh-colour eggs spotted with red. In consequence of the great strength and extent of its wings, this bird flies often so high as hardly to be seen, and to a distance from land so daring and extensive as to be often the sole object between the heavens and the sea, that presents itself to the eye of the wearied sailor. It passes over immense tracts of the ocean, at one flight; and when a single day is not sufficient, it continues its route during the darkest night; only stopping for refreshment in places where its food is abundant. From the immense size of its wings, this bird raises itself into the clouds; and while the storm roars below, it can look down from its elevated retreat, where it enjoys a perfect calm, upon the furious agitation of the elements beneath it. At other times, it swims with an easy motion through the tranquil air, in quest of its prey, or hangs motionless above the water, watching an opportunity of darting upon the devoted animal which shall first appear upon its surface.

Thus equipped for plunder, the frigate pelican is one of the most formidable tyrants of the ocean. Like the eagle upon land, he exercises a sort of dominion over the other aquatic tribes: happily, however, for their security, he seldom extends his excursions beyond the tropics, although he is found in the torrid zone, through every part of the globe. We have already seen with how much rigour he tyrannises over the tribe of boobies, in making them disgorge their food, after it is swallowed. When in flocks, sometimes their audacity has prompted the man-of-war birds to brave man himself. Upon the island of Ascension, a cloud of them attacked a crew of French sailors; and, till some of them were struck down, endeavoured to snatch the meat from their hands.

But the length of their wings, which gives these

birds such rapidity in the air, serves only to embarrass them when upon the ground. When perched, they have the same difficulty in taking flight as the booby; consequently they are sometimes knocked down, before they can make their escape. It is, probably, owing to the excessive length of their wings, that these, and some others of the palmated birds, perch upon trees, and the points of rocks, as from such places they can most easily launch into the air.

6. *P. Bassanus*. Gannet. Tail wedged; body white; bill and primary quill-feathers black; face blue; irids yellowish; tail-feathers twelve.

7. Another variety, brown spotted with white, beneath white, orbits naked, blackish.

8. A third variety, brown with triangular white spots, beneath whitish, spotted with brown; bill, wings, tail and legs brown.

This last variety inhabits Cayenne: the two former Europe and America.

The gannets are birds of passage, and make their appearance in the British isles in the summer season. They arrive in the month of March, and depart in August or September, according as they have been more or less disturbed in the business of nidification; those whose nests have not been plundered being always soonest ready to depart. The chief of their food consisting in herrings, it is probable that their arrival and departure are influenced by the motions of these fishes, which they are seen constantly attending during their whole circuit round the British islands. Hence the gannet is a bird extremely useful to fishermen, in pointing out the tracts which the shoals of herring pursue. It migrates southward in winter, after a similar food, as far as the coast of Portugal, where it is seen diving for pilchards, in the mouth of the Tagus.

In the breeding season, the gannets retire to the high rocks of the small uninhabited islands round the coast. They are found in vast numbers upon the isle of Ailsa, in the frith of Clyde; upon the rocks of St. Kilda, near the Orkneys; upon the Bass, in the vicinity of Edinburgh; and upon the Skelig isles, off the coast of Ireland. The surface of these dreary precipices is almost entirely covered, in the months of May and June, with nests, eggs, and young birds. The immense numbers of gannets and other birds, that fly around these rocky isles, appear, to a person at some distance, like a hive of bees: and, when he approaches the foot of the rocks, the air is immediately darkened with the vast flocks that rise from their nests; and so loud is their noise, that he can hardly hear the voice of a person standing by him.

The nests of the gannets are formed generally of sea-weeds, or any substance found floating upon the water. The female lays only one egg in the year; but, if that be carried away, she will lay twice, and even thrice, to fulfil the purposes of nature. The young are of a much darker hue than the old birds: they remain in their nests till they be almost full size, where they grow immensely fat. In that state they are taken, and dispersed among the inhabitants, who prize their flesh rather as a kind of variety, and a fashionable dish, than as an agreeable food. In St. Kilda, however, the natives view them in a very different light. They constitute the principal support of that half-famished people, through the year; and we are assured, that no fewer than twenty-two thousand young birds are consumed annually, besides a vast quantity of eggs.

Nor is this food, indifferent as it must prove on

constant repetition, easily procured; for the wretched inhabitants who go in quest of it are let down by a rope from the top of the precipice, and hang dangling in the air, sometimes two hundred fathoms from the ground. They are sometimes in danger from the insecure footing of those who hold the rope above, but more frequently from the tumbling down of loose stones by the swinging of the rope. When the person thus suspended has beat down all the young birds around, with his fowling staff, he is raised or lowered to a different part of the rock, as occasion requires; and, when he has completely destroyed all in one quarter, he is removed to another. In this adventurous manner do the inhabitants of the northern regions provide their annual stock of food. Both the eggs and fowls, which are thus procured at the hazard of their lives, are preserved in small pyramidal stone buildings, covered with ashes, to defend them from moisture. See Nat. Hist. Pl. CLXXXIV.

PELECOIDES, or HATCHET-FORM, in geometry, a figure in form of a hatchet. As the figure ABCDA, contained under the semicircle BCD and the two quadrantal arcs AB and AD. Pl. 129. fig. 8.

The area of the pelecoides is equal to the square AC, and this again is equal to the rectangle BE. It is equal to the square, because the two segments AB and AD, which it wants of the square on the lower part, are compensated by the two equal segments BC and CD, by which it exceeds on the upper part. And the square is equal to the rectangle BE, because the triangle ABD, which is half the square, is also half the rectangle BE of the same base and height with it.

PELEGRINO, a mountain on the N. coast of Sicily, nearly two miles W. of Palermo. On this mount is a cavern, in which is the image of St. Rosolia, who is said to have died here; and round the cave of this saint (who is the patroness of Palermo) a church is built, where priests attend, to watch the precious relics, and receive the offerings of the pilgrims.

PELETHITES. The Pelethites and Cherethites were famous under the reign of king David. They were the most valiant men in the army of that prince, and had the guard of his person. See Ezekiel xxv. 16. Zephaniah ii. 5. 1 Samuel xxx. 14. and 2 Samuel xv. 18. and xx. 7. and Patrick's Comm. Pool's Annot. and Delany's History of the Life of David.

PELETHRONII, an epithet given to the Lapithæ, because they inhabited Pelethronium, in Thessaly; or because one of their number bore the name of Pelethronius. It is to them mankind are indebted for the invention of the bit with which they tamed their horses, &c.

PELEUS, in fabulous history, a king of Thessaly, son of Æacus and Endeis, the daughter of Chiron. He married Thetis, one of the Nereids, and was the only one among mortals who married an immortal. Being accessory to the death of his brother Phocus, he retired to the court of Eurytus, who reigned at Phthia. He was purified of his murder by Eurytus, who gave him his daughter Antigone in marriage. Some time after this, Peleus and Eurytus went to the chase of the Calydonian boar, where the

father-in-law was accidentally killed by an arrow which his son-in-law had aimed at the beast. This unfortunate event obliged him to retire to Iolchos. Here Astydamia, the wife of Acastus, king of the country, became enamoured of him, and when she found him insensible to her passion, she accused him of attempts upon her virtue. The monarch did not put him to death, but caused him to be tied to a tree on mount Pelion, that he might become the prey of the wild beasts of the place; but Jupiter, who knew the innocence of Peleus, ordered Vulcan to set him at liberty. Peleus afterwards punished the ill-treatment which he had received from Acastus. He forcibly took Iolchos, drove the king from his possessions, and put to death the wicked Astydamia. After the death of Antigone, Peleus courted Thetis, who rejected his suit because he was a mortal. Having offered a sacrifice to the gods, Proteus at length informed him that to obtain Thetis he must surprise her asleep in her grotto, near the shores of Thessaly. This advice was followed, and Thetis, unable to escape from the grasp of Peleus, at last consented to marry him. Their nuptials were celebrated with the greatest solemnity by all the gods, who made them each the most valuable presents. The goddess of discord was the only one of the deities who was not present. (See DISCORDIA, PARIS.) From the marriage of Peleus and Thetis was born Achilles. (See ACHILLES.) The death of Achilles was the source of grief to Peleus, and Thetis, to comfort her husband, promised him immortality; and ordered him to retire into the grottos of the island of Leuce, where he would see and converse with the manes of his son.

PELEW ISLANDS, or PALAOS, a group of islands in the Pacific ocean, lying between 134 and 136 E. lon. and 6 and 8 N. lat. They are encircled on the W. side by a reef of coral; and the names of some of the principal are Oroolong, Emungs, Emillegue, Artingal, Co-rooraa, and Pelelew. They are well covered with trees of various kinds and sizes; and every part of that called Co-rooraa, to which Pelew appeared to be the capital, seemed to bear the marks of industry and good cultivation. Capt. Wilson, of the Antelope East India packet, who was wrecked here in 1783, represents the natives simple in their manners, delicate in their sentiments, friendly in their disposition, and, in fine, a people that do honour to the human race. The astonishment which those, who first discovered the English, manifested on seeing their colour, plainly showed, that they had never before seen a white man. They had no idea of the nature of powder and shot, and were exceedingly amazed on seeing its effects. Their principal arms consist of bamboo darts, from five to eight feet long, pointed with the wood of the betel-nut tree; but there are short ones for different marks, which are thrown by means of a stick two feet long. The chiefs wear a bone round one of their wrists, in the form of a bracelet, which, being a mark of great honour conferred by the king, is never to

be parted with but with life. They are not all of the same degree, as appeared from a difference in the bone they wore. Captain Wilson was invested with the highest order of the bone. With respect to property in these islands, a man's house or canoe is considered as his own, as is also the land allotted to him, as long as he occupies and cultivates it; but whenever he removes to another place, the ground reverts to the king. The natives make canoes out of the trunks of trees, some large enough to carry 30 men. Yams and coconuts, being their chief articles of subsistence, are attended with the utmost care; and the milk of the latter is their common drink. On particular occasions, they add to their ordinary fare certain sweetmeats, and a sweet beverage, obtained by the aid of a syrup, extracted either from the palm-tree or the sugar-cane. The houses are raised about three feet from the ground, the foundation beams being laid on large stones, whence spring the upright supports of their sides, which are crossed by other timbers grooved together, and fastened by wooden pins; the intermediate space being closely filled up with bamboos and palm-tree leaves, platted together. The tops of the house are covered with bamboos and palm-tree leaves; and the inside is without any division, forming one great room. As to domestic implements, they have little baskets, nicely woven from slips of the plantain-tree, and wooden baskets with covers, neatly carved and inlaid with shells. No one goes abroad without a basket, which usually contains some betel-nut, a comb, knife, and a little twine. The best knives are made of a piece of the large mother-of-pearl oyster, ground narrow, and the outward side a little polished. The combs are made of the orange-tree, of which there are a few of the Seville kind; the handle and teeth are fastened in the solid wood. The fishing hooks are of tortoise-shell; and twine, cord, and fishing nets, are well manufactured from the husks of the coconut. Of the plantain leaf are formed mats, which serve the people as beds. They also use a plantain leaf at meals, instead of a plate; and the shell of a cocoa-nut supplies the place of a cup. There are vessels of a kind of earthen ware, of a reddish brown colour, in which they boil their fish, yams, &c. A bundle of coconut husks serves them for a broom; and thick bamboos, with bores five or six inches in diameter, are their buckets or cisterns. The shell of the tortoise is here remarkably beautiful; and the natives have discovered the art of moulding it into little trays or dishes, and spoons. Some of the great ladies have also bracelets of the same manufacture, and earrings inlaid with shells. The natives, in general, are stout and well made, rather above the middling stature, and of a deep copper colour. Their hair is long, and generally formed into one large loose curl round their heads. The men are entirely naked: but the women wear two little aprons, one before, the other behind. Both sexes are tattooed, and have their teeth made black by art. They are very expert at

swimming; and the men are such admirable divers, that they will readily fetch up any thing from the bottom of the sea. Such an opinion had the king of the island entertained of the English, that, on their departure, he suffered his second son, Lee Boo, to accompany them to England, where this hopeful youth died of the smallpox in 1784. The East India Company erected a monument over his grave in Rotherhithe churchyard. These islands are encircled on the W. side by a reef of coral.

PELF. *s.* (In low Latin, *pelfra.*) Money; riches (*Sidney. Swift.*)

PELIAS, the twin brother of Neleus, was son of Neptune by Tyro, the daughter of Salmones. His birth was concealed by his mother, who wished her father to be ignorant of her incontinence. He was exposed, but his life was preserved by shepherds, who named him Pelias, from a spot of the colour of lead in his face. Some time after this, Tyro married Cretheus, king of Iolchos. Meantime Pelias visited his mother, and after the death of Cretheus, he unjustly seized his kingdom, which belonged to the children of Tyro. But Jason, the son of Æson, the eldest of the children of Cretheus, afterwards boldly demanded the kingdom which he had usurped. Pelias then, in order to divert his attention, told him he would voluntarily resign the crown, if he went to Colchis to avenge the death of Phryxus, whom Æetes had cruelly murdered. This expedition, which was likely to be attended with much glory, was readily undertaken by Jason. (See JASON). Upon the return of Jason from Colchis, the daughters of Pelias, called Peliades, solicited Medea (see MEDEA) to restore their father to youth, as she had Æson, her father-in-law; but after the Peliades had, by her directions, cut their father's body to pieces, and had drawn all the blood from his veins, on the assurance that Medea would replenish them by her incantations, Medea suffered the flesh to be totally consumed in a cauldron of boiling water, and refused to give the Peliades the promised assistance. The Peliades were four in number, Alceste, Pisidice, Pelopea, and Hippothoe, to whom Hysinus adds Medusa. After this parricide, they fled to the court of Admetus, where Acastus, the son-in-law of Pelias, pursued them, and took their protector prisoner. The Peliades died, and were buried in Arcadia.—2. A Trojan chief, wounded by Ulysses during the Trojan war. He survived the ruin of his country, and followed the fortune of Æneas. (*Virg.*)—The ship Argo is called Pelias arbor, built of the trees of mount Pelion.—The spear of Achilles. (See PELION.)

PELICAN, in ornithology. See PELECANUS.

PELIGNI, a people of Italy who dwelt near the Sabines and Marsi. Corfinium and Sulmo were the chief towns of this country.

PELION and PELIOS, a celebrated mountain of Thessaly. In their wars against the gods, the giants, as the poets mention, placed mount Ossa upon Pelion, to scale the heavens

with more facility. The celebrated huge spear of Achilles, which none but the hero could wield, had been cut down on this mountain, and thence called Pelias. It was a present from his præceptor Chiron.

PELISSA, a town of Lower Hungary, capital of a county of the same name. It is seated near the Danube, 15 miles N. of Buda. Lon. 18. 20 E. Lat. 47. 40 N.

PELISSANE, a town of France, in the department of the Mouths of the Rhone, 15 miles W.N.W. of Aix. Lon. 5. 21 E. Lat. 43. 26 N.

PELL (John), an English mathematician of Southwyke, Sussex, was born in 1610, educated at Stenning school, and at 13 entered at Trinity college, Cambridge, where he applied himself to mathematics with unusual assiduity. After taking his master's degree, he was incorporated at Oxford in 1631, and by his various publications he acquired so much reputation, that he was invited in 1639 to fill up a professor's chair at Amsterdam, to which he succeeded 1643. In 1646 he settled at Breda as professor of philosophy and mathematics, at the request of the prince of Orange, and in 1652 returned to his native country. In 1654 he was sent by Cromwell as English resident to Switzerland, and returned a little before the protector's death. In 1661 he was ordained by the bishop of Lincoln, and obtained from the crown the rectory of Fobbing in Essex, to which the bishop of London afterwards added the rectory of Lavingdon in that county. Though respectable as a scholar, and a man of science, Dr. Pell was unfortunately very inattentive to the state of his domestic affairs, and consequently he became poor in his old age, and was even confined in the king's bench as a debtor. He died 1685, and was interred by the charity of Busby, master of Westminster school, and Sharp, rector of St. Giles'.

Pell was the author of various works, and among them the following:

1. An Exercitation concerning Easter; 1644, in 4to.
2. A Table of 10,000 square numbers, &c. 1672, folio.
3. An Inaugural Oration at his entering upon the Professorship at Breda.
4. He made great alterations and additions to Rhonius's Algebra, printed at London 1668, 4to, under the title of, An Introduction to Algebra; translated out of the High Dutch into English, by Thomas Branker, much altered and augmented by D. P. (Dr. Pell). Also a Table of Odd Numbers, less than 100,000, shewing those that are incomposite, &c. supputated by the same Thomas Branker.
5. His Controversy with Longomontanus concerning the Quadrature of the Circle; Amsterdam, 1646, 4to.

He likewise wrote a Demonstration of the 2d and 10th books of Euclid; which piece was in MS. in the library of lord Brereton in Cheshire: as also Archimedes's Arenarius, and the greatest part of Diophantus's six books of

Arithmetic; of which author he was preparing, August, 1644, a new edition, in which he intended to have corrected the translation, and made new illustrations. He designed likewise to publish an edition of Apollonius, but laid it aside, in May, 1645, at the desire of Golius, who was engaged in an edition of that author from an Arabic manuscript given him at Aleppo eighteen years before. Letters of Dr. Pell to sir Charles Cavendish, in the Royal Society.

Some of his manuscripts he left at Brereton in Cheshire, where he resided some years, being the seat of William lord Brereton, who had been his pupil at Breda. A great many others came into the hands of Dr. Busby; which Mr. Hook was desired to use his endeavours to obtain for the Society. But they continued buried under dust, and mixed with the papers and pamphlets of Dr. Busby, in four large boxes, till 1755; when Dr. Birch, secretary to the Royal Society, procured them for that body, from the trustees of Dr. Busby.

The collection contains not only Pell's mathematical papers, letters to him, and copies of those from him, &c. but also several manuscripts of Walter Warner, the mathematician and philosopher, who lived in the reigns of James I. and Charles I.

Dr. Pell invented the method of ranging the several steps of an algebraical calculus, in a proper order, in so many distinct lines, with the number affixed to each step, and a short description of the operation or process in the line. He also invented the character $\div$ for division, $\otimes$ for involution, and μ for evolution.

PELLA, a celebrated town of Macedonia, which became the capital of the country, after the ruin of Edessa. Philip, king of Macedonia, was educated there, and Alexander the Great was born there, whence he is often called Pellæus juvenis. The tomb of the poet Euripides was in the neighbourhood.

PELLERIN, a town of France, in the department of Lower Loire, situate on the Loire, with a harbour for small vessels, 10 miles N. of Nantes, and 13 S.E. of Painbœuf. Lon 1. 44 W. Lat. 47. 23 N.

PELLET. *s.* (from *pile*, Lat. *pelote*, Fr.) 1. A little ball (*Sandys*). 2. A bullet; a ball to be shot (*Ray*).

PELLETED. *a.* (from *pellet*.) Consisting of bullets (*Shakspeare*).

PELLICULE. *s.* (*pellicula*, Lat.) 1. A thin skin (*Sharp*). 2. It is often used for the film which gathers upon liquors impregnated with salt or other substance, and evaporated by heat.

PELLISON, or PELLISON FONTANIER (Paul), one of the finest geniuses of the 17th century, was the son of James Pellison counsellor at Castres. He was born at Beziers in 1624, and educated in the Protestant religion. He studied with success the Latin, Greek, French, Spanish, and Italian tongues, and applied himself to the reading the best authors in these languages; after which he studied the law at Castres with reputation. In 1652 he purchased the post of secretary to the king, and five years after became first deputy to M. Fou-

quet. He suffered by the disgrace of that minister; and in 1661 was confined in the Bastille, from whence he was not discharged till four years after. During his confinement he applied himself to the study of controversy; and in 1670 abjured the Protestant religion. Louis XIV. bestowed upon him an annual pension of 2000 crowns; and he likewise enjoyed several posts. In 1676 he had the abbey of Giment, and some years after the priory of St. Orens at Auch. He died in 1693. His principal works are, 1. The History of the French Academy. 2. Reflections on religious disputes, &c. in 4 vols. 12mo. 3. The History of Louis XIV. 4. Historical Letters and Miscellanies, in 3 vols. 12mo.

PELLITORY. In botany. See ACHILLEUS.

PELLITORY OF SPAIN. See ANTHEMIS and PYNETHRA.

PE'LLMELL. *ad.* (*pesle mesle*, Fr.) Confusedly; tumultuously; one among another; with confused violence (*Hudibras*).

PELLS. *s.* (*pellis*, Lat.) Clerk of the *pellis*, an officer belonging to the exchequer, who enters every teller's bill into a parchment roll called *pellis acceptorum*, the roll of receipts (*Bailey*).

PELLUCID. *a.* (*pellucidus*, Lat.) Clear; transparent; not opaque; not dark (*Newton*).

PELLUCIDITY. PELLUCIDNESS. *s.* (from *pellucid*.) Transparency; clearness; not opacity (*Locke. Keil*).

PELOPEA, or PELOPIA, a daughter of Thyestes, the brother of Atreus. She had a son by her father, who knew not that she was his own daughter. Some suppose that Thyestes purposely committed this incest, as the oracle had informed him that his wrongs should be avenged, and his brother destroyed by a son who should be born from him and his daughter. This proved too true. Pelopea afterwards married her uncle Atreus, who kindly received in his house his wife's illegitimate child, called Ægysthus, because preserved by goats, (*ægys*) when exposed in the mountains. Ægysthus became his uncle's murderer. (See ÆGYSTHUS.)

PELOPEIA, a festival observed by the people of Elis in honour of Pelops.

PELOPIDAS, a celebrated general of Thebes, son of Hippoclus, descended of an illustrious family, and remarkable for his immense possessions, which he bestowed with great liberality to the poor. He took great delight in the conversation of Epaminondas (see EPAMINONDAS), who despised riches, and from their friendship and intercourse the Thebans derived the most considerable advantages. No sooner had the interest of Sparta prevailed at Thebes, and the friends of liberty been banished from the city, than Pelopidas, who was in the number of the exiles, resolved to free his country from foreign slavery. Mean while Epaminondas, who had been left by the tyrants at Thebes, as a worthless philosopher, animated the youths of the city, and at last Pelopidas, and eleven of his associates, entered Thebes, massacred the

friends of the tyranny, and freed their country from foreign masters. After this successful enterprise, Pelopidas was placed at the head of the government, and so confident were the Thebans of his abilities, that they successfully re-elected him 13 times to fill the office of governor of Bœotia. Epaminondas shared with him the sovereign power, and it was to their valour and prudence that the Thebans were indebted for a celebrated victory at the battle of Leuctra. In a war which Thebes carried on against Alexander, tyrant of Phœæ, Pelopidas was appointed commander, and by his imprudence was taken prisoner, but Epaminondas restored him to liberty. The perfidy of Alexander irritated him, and he was killed bravely fighting in a celebrated battle in which his troops obtained the victory, B. C. 364 years. He received an honourable burial. Pelopidas is admired for his valour, as he never engaged an enemy without obtaining the advantage, and it has been justly observed, that with Pelopidas and Epaminondas the glory and the independence of the Thebans rose and set.

PELOPONNESIACUM BELLUM, Peloponnesian war, a celebrated war which continued for 27 years with various success, between the Athenians and the inhabitants of Peloponnesus, with their respective allies. It is the most famous and the most interesting of all the wars which happened between the inhabitants of Greece. The famous battle of Ægospotamos, where Lysander, the Lacedæmonian commander, attacked the Athenian fleet, and almost totally destroyed it, may be said to have been the finishing stroke of this long and obstinate contest. Of one hundred and eighty sail, only nine escaped, eight of which fled, under the command of Conon, to the island of Cyprus, and the other carried to Athens the melancholy news of the defeat. During four months, negociations were carried on with the Spartans, by the aristocratical part of the Athenians, and after a negociation of four months, it was at last agreed, that, to establish the peace, the fortifications of the Athenian harbours must be demolished, together with the long walls which joined them to the city; all their ships, except twelve, were to be surrendered to the enemy; they were to resign every pretension to their ancient dominions abroad; to recall from banishment all the members of the late aristocracy; to follow the Spartans in war, and in the time of peace, to frame their constitution according to the will and the prescriptions of their Peloponnesian conquerors. The terms were accepted, and the enemy entered the harbour, and took possession of the city. The walls and fortifications were instantly levelled with the ground. This memorable event happened about 404 years before the Christian era, and 30 tyrants were appointed by Lysander over the government of the city. To the correct and authentic writings of Thucydides and Xenophon we are principally indebted for the circumstantial detail of the events and revolutions of this war.

PELOPONNESUS, a celebrated peninsula, which comprehends the most southern parts of

Greece. It received this name from Pelops, who settled there, as the name indicates (*νηπότης*, the island of Pelops). It had been called before Argia, Pelasgia, and Argolis. Its present name is Morea. Peloponnesus was divided into six different provinces, Messenia, Laconia, Elis, Arcadia, Achaia propria, and Argolis, to which some add Sicyon. These provinces all bordered on the sea shore, except Arcadia. It was conquered some time after the Trojan war, by the Heraclidæ, who had been forcibly expelled from it. Its inhabitants rendered themselves illustrious, like the rest of the Greeks, by their genius, their fondness for the fine arts, the cultivation of learning, and the profession of arms. (See **PELOPONNESIACUM BELLUM**.) The Peloponnesus scarce extended 200 miles in length, and 140 in breadth. It was separated from Greece by the narrow isthmus of Corinth.

PELOPS, a celebrated prince, son of Tantalus, king of Phrygia. He was murdered by his father, who wished to try the divinity of the gods who had visited Phrygia, by placing on their table the limbs of his son. The gods perceived his cruelty, and they all refused to touch the meat, except Ceres, whom the recent loss of her daughter had rendered melancholy. She ate one of the shoulders of Pelops, and therefore when Jupiter restored him to life, he placed a shoulder of ivory instead of that which Ceres had devoured. This shoulder had an uncommon power, and it could heal by its very touch every complaint, and remove every disorder. Pindar, however, confutes the tradition of his ivory shoulder. Some time after, the kingdom of Tantalus was invaded by Tros, king of Troy, on pretence that he had carried away his son Ganymedes. Tantalus defeated, was obliged to fly with his son Pelops, and to seek a shelter in Greece. Pelops came to Pisa, where he became one of the suitors of Hippodamia, the daughter of king Cœnomaus, whom he conquered in a chariot race, and thereby gained his wife. (See **OENOMAUS**.) When he had established himself on the throne of Pisa, Hippodamia's possession, he extended his conquests over the neighbouring countries, and from him the peninsula, of which he was one of the monarchs, received the name of Peloponnesus. Pelops, after death, received divine honours. The children of Pelops by Hippodamia were Pitheus, Trœzen, Atreus, Thyestes, &c. besides some by concubines. The time of his death is unknown. Some suppose that the Palladium of the Trojans was made with the bones of Pelops. His descendants were called Pelopidæ. Some suppose that Pelops first instituted the Olympic games in honour of Jupiter, and to commemorate the victory which he had obtained over Cœnomaus.

PELORUM, or **PELORUS**, one of the three great promontories of Sicily, near Charybdis. It lies near the coast of Italy, and received its name, as some assert, from Pelorus, the pilot of the ship which carried Annibal away from Italy.

PELT. s. (from *pellis*, Latin.) 1. Skin;

hide (*Brown*). 2. The quarry of a hawk all torn (*Ainsworth*).

To PELT. *v. a.* (*pollern*, German. *Skinner*.) 1. To strike with something thrown (*Atterbury*). 2. To throw; to cast (*Dryden*).

PELTA, a small, light, manageable buckler, used by the ancients. It was worn by the Amazons. The pelta is said by some to have resembled an ivy leaf in form; by others it is compared to the leaf of an Indian fig-tree; and by Servius to the moon in her first quarter.

PELTA, in botany, a flat fructification on some lichens, resembling a round shield; whence its name.

PELTARIA, in botany, a genus of the class tetradynamia, order siliculosa. Silicle entire, somewhat orbicular, compressed, flat, not opening; one or three-seeded. Three species, herbs of the Cape.

PELTATE LEAF. A target-shaped leaf. Having the petiole inserted into the disk of the leaf, instead of the edge or base, as is most usual. As in *nymphæa*, *hernandia*, *colocasia*, *hydrocotyle*, *tropæolum*, *geranium peltatum*.—Applied also to a stigma, when it is round and flat, like a pelta.

PELTING. *a.* This word, in *Shakspeare*, signifies mean; paltry; pitiful.

PELTMONGER. *s.* (*pellio*, Latin; *pelt* and *monger*.) A dealer in raw hides.

PELVIS. (from *πελος*, a basin, because it is shaped like a basin used in former times.) The cavity below the belly. It is composed of four bones, viz. two OSSA INNOMINATA, the SACRUM, and OS COCCYGIS, which see. It contains the organs of generation, the bladder, and the rectum. See UTERUS, OVARIA, VAGINA, VESICA URINARIA, PROSTATE GLAND, RECTUM, &c.

PELVIS (Ligaments of). The articulation of the os sacrum with the last lumbar vertebra, and with the ossa innominata, is strengthened by means of a strong transverse ligament, which passes from the extremity and lower edge of the last lumbar vertebra, to the posterior and internal surface of the spine of the ilium. Other ligaments are extended posteriorly from the os sacrum to the os ilia on each side, and, from the direction of their fibres, may be called the lateral ligaments. Besides these, there are many shorter ligamentous fibres, which are seen stretching from the whole circumference of the articulating surfaces of these two bones. But the most remarkable ligaments of the pelvis are the two sacro-ischiatic ligaments, which are placed towards the posterior and inferior part of the pelvis. One of these may be called the greater, and the other the lesser sacro-ischiatic ligament. The first of these is attached to the posterior edge of the os sacrum, to the tuberosity of the ilium, and to the first of the three divisions of the os coccygis. Its other extremity is inserted into the inner surface of the tuberosity of the ischium. At its upper part it is of considerable breadth, after which it becomes narrower, but expands again before its insertion into the ischium, and, extending along the tuberosity of that bone to the

lower branch of the os pubis, where it terminates in a point, forms a kind of falx, one end of which is loose, while the other is fixed to the bone. The lesser sacro-ischiatic ligament is somewhat thicker than the former, and is placed obliquely before it. It extends from the transverse processes of the os sacrum, and the tuberosity of the spine of the ilium on each side, to the spine of the ischium. These two ligaments not only serve to strengthen the articulation of the ossa innominata with the os sacrum, but to support the weight of the viscera contained in the pelvis, the back and lower part of which is closed by these ligaments. The posterior and external surface of the greater ligament likewise serves for the attachment of some portions of the *gluteus maximus* and *gemini* muscles. The symphysis pubis is strengthened internally by a transverse ligament, some of the fibres of which are extended to the obturator ligament.

PELUSIUM, a town of Egypt, situate at the entrance of one of the mouths of the Nile, called from it Pelusian. It is about 20 stadia from the sea, and received the name from the lakes and marshes (πηλες) in its neighbourhood. It is now in ruins.

PEMBA, a town of Congo, capital of a province of the same name. Lon. 13. 25 E. Lat. 7. 30 S.

PEMBA, or PENDA, an island in the E. Indian Ocean, near the coast of Africa, about 100 miles in circumference, governed by a king, tributary to the Portuguese. Lon. 40. 0 E. Lat. 5. 50 S.

PEMBERTON (Dr. Henry), a learned physician and mathematician, was born at London, in 1694. After studying grammar at a school, and the higher classics under Mr. John Ward, afterwards professor of rhetoric at Gresham college, he went to Leyden to attend the lectures of the celebrated Boerhaave, to qualify himself for the profession of medicine. Here also, as well as in England, he constantly mixed with his professional studies those of the best mathematical authors. From Leyden he went to Paris, in order to perfect himself in the practice of anatomy, which he readily attained, being naturally dexterous in all manual operations. Having obtained his main object, he returned to London; enriched likewise with other branches of scientific knowledge, and a choice collection of mathematical books, both ancient and modern. After his return he assiduously attended St. Thomas's hospital, to acquire the London practice of medicine and surgery; though he seldom practised, owing to his delicate state of health. In 1719 he went again to Leyden to take his degree of M. D. where he was most kindly entertained by his friend Boerhaave. On his second return to London, he became more intimately acquainted with Dr. Mead, sir Isaac Newton, and other eminent men. And being an active man, he was highly useful to his friends; as, to Newton in preparing a new edition of his *Principia*, and in writing a popular account of his philosophical discoveries;

to Mr. Robins in bringing him forward, and writing some pieces printed in the 2d volume of that gentleman's collection of Tracts, &c. Being chosen professor of physic in Gresham college, he undertook to give a course of lectures on chemistry, which was improved every time he delivered it, and was published in 1771, by his friend Dr. James Wilson. After a long and laborious life spent in improving science, and assisting its cultivators, Dr. Pemberton died in 1771, at 77 years of age.

Besides the doctor's writings abovementioned, he wrote, 1. *Epistola ad Amicum de Cotesii inventis*; demonstrating Cotes's celebrated theorem, and shewing his other theorems by logarithms may be effected by the circle and hyperbola. 2. *Observations on Poetry*, especially the epic, occasioned by Glover's *Leonidas*. 3. A plan of a free state, with a king at its head (not published). 4. Account of the ancient ode, printed in the preface to West's *Pindar*. 5. A paper on the dispute about Fluxions, printed in the 2d vol. of Robins's Tracts. 6. On the Alteration of the Style and Calendar. 7. On reducing the Weights and Measures to one Standard. 8. A Dissertation on Eclipses. 9. On the *Loci Plani*, &c. His numerous communications to the Royal Society, in a variety of interesting subjects, extend from the 32d to the 62d vol. of the *Philos. Transactions*.

After his death many valuable pieces were found among his papers, viz. A short History of Trigonometry from Menelaus to Napier. A comment on an English translation of Newton's *Principia*. Demonstrations of Spherics and Spherical Projections, enough to compose a treatise on those subjects. A Dissertation on Archimedes's Screw. Improvements in Gauging. In a given latitude to find the point of the ecliptic which ascends the slowest. To find when the oblique ascension differs most from the arch to which it belongs. On the principles of Mercator's and middle latitude sailing. To find the heliacal rising of a star. To compute the moon's parallax. To determine the course of a comet in a parabolic orbit. Most of these are very neat and perspicuous.

PEMBRIDGE, a town in Herefordshire, with a market on Tuesday, seated on the Arrow, 12 miles N.W. of Hereford, and 145 W.N.W. of London. Lon. 2. 42 W. Lat. 52. 14 N.

PEMBROKE, the capital of Pembroke-shire, with a market on Saturday. It is seated on the innermost creek of Milford Haven, over which are two bridges, but the navigation to it is become injured by the rubbish of the limestone quarries near it. It is surrounded by a wall with three gates, has a castle on a rock, and two churches. It is governed by a mayor, sends one member to parliament, and is 10 miles S.E. of Haverfordwest, and 237 W. by N. of London. Lon. 4. 55 W. Lat. 51. 43 N.

PEMBROKE (Thomas), an English painter, and pupil of Larroon, whose manner he imi-

tated. He painted several pictures for the earl of Bath, and died in London about 1730, at the age of 28.

PEMBROKE (Mary Herbert), was wife of Henry earl of Pembroke, and sister of the celebrated sir Philip Sidney, who dedicated his *Arcadia* to her, which occasioned it to be called the countess of Pembroke's *Arcadia*. She translated a French tragedy called *Antionus*.

PEMBROKESHIRE, a county of South Wales, 37 miles long and 28 broad; surrounded on all sides by the sea, except on the E. where it is bounded by Carmarthenshire and Cardiganshire. It contains 335,600 acres; is divided into seven hundreds, and 145 parishes; has one city and seven market towns, and sends three members to parliament. The number of inhabitants in 1801 was 56,280. The rivers are inconsiderable. A great part of the county is plain, and tolerably fertile, consisting of rich meadow and arable land. The N.E. part alone is mountainous; which, however, yields good pasture for sheep and cattle.

PEMPHIGUS. (*πεμφιγος*, from *πνιμιξ*, a bubble). A fever attended by successive eruptions of vesicles about the size of almonds, which are filled with a yellowish serum, and in three or four days subside. The fever may be either synocha or typhus. It is a genus of disease in the class pyrexia and order exanthemata of Cullen. It is divided according to the size of the eruption into major and minor.

PEN. *s. (penna, Latin.)* 1. An instrument of writing (*Dryden*). 2. Feather (*Spenser*). 3. Wing (*Milton*). 4. (from *pennan*, Saxon.) A small enclosure; a coop (*L'Estrange*).

To PEN. *v. a. pret. and part. pass. pent.* (*pennan* and *pinban*, Saxon.) 1. To coop; to shut up; to incage; to imprison in a narrow place (*Bacon*). 2. (from the noun; pret. and part. pass. *penned*.) To write (*Digby*).

PEN, a little instrument, usually formed of a quill, serving to write with. Pens are also sometimes made of silver, brass, or iron.

PENS (Dutch), are made of quills that have passed through hot ashes, to take off the grosser fat and moisture, and render them more transparent and brittle.

PEN (Fountain), is a pen made of silver, brass, &c. contrived to contain a considerable quantity of ink, and let it flow out by gentle degrees, so as to supply the writer a long time without being under the necessity of taking fresh ink.

The fountain pen is composed of several pieces, as shewn at the bottom of pl. 129, where the middle piece F carries the pen, which is screwed into the inside of a little pipe, which again is soldered to another pipe of the same bigness as the lid G; in which lid is soldered a male screw, for screwing on the cover, as also for stopping a little hole at the place and hindering the ink from passing through it. At the other end of the piece F is a little pipe, on the outside of which the top-cover H may be screwed. In the cover there goes a port-crayon, which is to be screwed into the last-mentioned pipe, in order to

stop the end of the pipe, into which the ink is to be poured by a funnel. To use the pen, the cover G must be taken off, and the pen a little shaken, to make the ink run more freely.

There are, it is well known, some instruments used by practical mathematicians, which are called pens, and which are distinguished according to the use to which they are principally applied; as for example, the drawing pen, &c. an instrument too common to require particular description in this place.

PEN (Musical), a kind of fountain pen, contrived to deliver ink freely from five equidistant nibs at once, and thus formed for the purpose of ruling five equidistant lines, such as music is written on, at once.

PEN (Geometric), is an instrument in which, by a circular motion, a right line, a circle, an ellipse, and other mathematical figures, may be described. It was first invented and explained by John Baptist Suardi, in a work entitled *Nuovo Istromenta per la Descrizione di diverse Curve Antichi e Moderne*, &c. Several writers had observed the curves arising from the compound motion of two circles, one moving round the other; but Suardi first realized the principle, and first reduced it to practice. It has been lately introduced with success into the steam-engine by Watt and Bolton. The number of curves this instrument can describe is truly amazing; the author enumerates not less than 1273, which, he says, can be described by it in the simple form.

For a minute description of the geometrical pen, we must refer to Adams's *Geometrical and Graphical Essays*, and the 2d vol. of Prony's *Architecture Hydraulique*.

PENÆA, in botany, a genus of the class tetrandria, order monogynia. Calyx two-leaved; corol campanulate; style quadrangular; capsule square, four-celled, eight-seeded. Nine species; two of Ethiopia, the rest of the Cape: from one of the Æthiopian species is supposed to be obtained the concrete juice of the dispensatories, entitled *sarcocolla*; whence the species is denominated *P. sarcocolla*. It is probable that the other Æthiopian species, *P. mucronata*, affords a similar fluid. See *SARCOCOLLA*.

PENAL. *a.* (*penal*, Fr. from *pœna*, Lat.). 1. Denouncing punishment; enacting punishment (*South*). 2. Used for the purposes of punishment; vindictive (*Milton*).

PENALITY. *s.* (*penalité*, old Fr.) Liable-ness to punishment; condemnation to punishment (*Brown*).

PENALTY. *s.* (from *penalité*, old French). 1. Punishment; censure; judicial infliction (*Locke*). 2. Forfeiture upon non-performance (*Shakspeare*).

PENANCE. *s.* (*penence*, old French.) In-
 fliction either public or private, suffered as an expression of repentance for sin (*Bacon*).

PENATES, certain inferior deities among the Romans, who presided over houses and the domestic affairs of families. They were called Penates, because they were generally

placed in *penitissima adium parte*. The place where they stood was afterwards called *penetralia*, and they themselves received the name of *Penetrales*. According to some, the gods Penates were divided into four classes; the first comprehended all the celestial, the second the sea gods, the third the gods of hell, and the last all such heroes as had received divine honours. The statues of the Penates were generally made of wax, ivory, silver, or earth, according to the affluence of the worshipper, and the only offerings they received were wine, incense, fruits, and sometimes the sacrifice of lambs, sheep, goats, &c. Some have con-founded the Lares and the Penates, but they were different.

PENCE. *s.* The plural of *penny*.

PENCIL. *s.* (*penicillum*, Latin.) 1. A small brush of hair which painters dip in their colours (*Dryden*). 2. A black lead pen, with which, cut to a point, we write without ink (*Watts*). 3. Any instrument for writing without ink.

To PENCIL. *v. n.* (from the noun). To paint (*Shakspeare*).

PENCIL OF RAYS, in optics, is a double cone, or pyramid of rays, joined together at the base; one of which hath its vertex in some point of the object, and has the crystalline humour, or a glass for its base; and the other has its base on the same glass or crystalline, but its vertex in the point of convergence.

PENDANT, an ornament hanging at the ear, frequently consisting of diamonds, pearls, and other precious stones.

PENDANTS, in heraldry, parts hanging down from the label, to the number of three, four, five, or six at most, resembling the drops in the Doric frieze.

PENDANTS OF A SHIP, are those streamers or long colours which are split and divided into two parts ending in points, and hung at the head of masts, or at the yard-arm ends.

PENDENNIS, a castle in Cornwall, on a hill of the same name, on Falmouth bay. It was built by Henry VIII. for the security of the coast; and on the opposite side of the bay is another called *St. Maws*. It is a little to the S.E. of Falmouth, the harbour of which it defends.

PENDENCE. *s.* (from *pendeo*, Latin.) Slopeness; inclination (*Wotton*).

PENDENCY. *s.* (from *pendeo*, Latin.) Suspense; delay of decision (*Ayliffe*).

PENDENT. *a.* (*pendens*, Lat.) 1. Hang-
 ing (*Shakspeare*). 2. Jutting over (*Shaks.*). 3. Supported above ground (*Milton*).

PENDING. *a.* (*pendente lite*, Latin.) Depending; remaining yet undecided (*Ayl.*).

PENDULOSITY. PE'NDULOUSNESS. *s.* (from *pendulous*.) The state of hanging; sus-
 pension (*Brown*).

PE'NDULOUS. *a.* (*pendulus*, Lat.) Hang-
 ing; not supported below (*Ray*).

PENDULUM, in mechanics, any heavy body, so suspended as that it may swing back-
 wards and forwards, about some fixed point, by the force of gravity.

P E N D U L U M.

These alternate ascents and descents of the pendulum are called its oscillations, or vibrations; each complete oscillation being the descent from the highest point on one side, down to the lowest point of the arch, and so on up to the highest point on the other side. The point round which the pendulum moves, or vibrates, is called its centre of motion, or point of suspension: and a right line drawn through the centre of motion, parallel to the horizon, and perpendicular to the plane in which the pendulum moves, is called the axis of oscillation. There is also a certain point within every pendulum, into which, if all the matter that composes the pendulum were collected, or condensed as into a point, the times in which the vibrations would be performed would not be altered by such condensation; and this point is called centre of oscillation. The length of the pendulum is usually estimated by the distance of this point below the centre of motion, being always near the bottom of the pendulum; but in a cylinder or any other uniform prism or rod, it is at the distance of one third from the bottom, or two-thirds from and below the centre of motion.

The length of a pendulum, so measured to its centre of oscillation, that it will perform each vibration in a second of time, thence called the second's pendulum, has, in the latitude of London, been generally taken at $39\frac{1}{10}$ or $39\frac{1}{8}$ inches; but by some very ingenious and accurate experiments, the late celebrated Mr. George Graham found the true length to be $39\frac{133}{1000}$ inches, or $39\frac{1}{8}$ inches very nearly.

The length of the pendulum vibrating seconds at Paris was found by Varin, Des Hays, De Glos; and Godin, to be $440\frac{3}{4}$ lines; by Picard $440\frac{1}{2}$ lines; and by Mairan $440\frac{1}{3}$ lines.

Galileo was the first who made use of a heavy body annexed to a thread, and suspended by it, for measuring time, in his experiments and observations. But according to Sturmius, it was Riccioli who first observed the isochronism of pendulums, and made use of them in measuring time. After him Tycho, Langrene, Wendeline, Mer-senne, Kircher, and others, observed the same thing; though it is said, without any intimation of what had been done by Riccioli. But it was the celebrated Huygens who first demonstrated the principles and properties of pendulums, and probably the first who applied them to clocks. He demonstrated, that if the centre of motion was perfectly fixed and immovable, and all manner of friction, and resistance of the air, &c. removed, then a pendulum, once set in motion, would for ever continue to vibrate without any decrease of motion, and that all its vibrations would be perfectly isochronal, or performed in the same time. Hence the pendulum has universally been considered as the best chronometer or measurer of time. And as all pendulums of the same length perform their vibrations in the same time, without regard to their different weights, it has been suggested, by means of them, to establish an universal standard for all countries.

Pendulums are either simple or compound; and each of these may be considered either in theory, or as in practical mechanics among artisans.

A simple pendulum, in theory, consists of a single weight, as A, plate 132, fig. 1, considered as a point, and an inflexible right line AC, supposed void of gravity or weight, and suspended from a fixed point or centre, C, about which it moves.

A compound pendulum, in theory, is a pendulum consisting of several weights moveable about one common centre of motion, but connected together so as to retain the same distance both from one another, and from the centre about which they vibrate.

The doctrine and laws of pendulums.—1. A pendulum raised to B, through the arc of the circle AB, will fall and rise again, through an equal arc, to a point equally high, as D: and thence will fall to A, and again rise to B; and thus continue rising and falling perpetually. For it is the same thing whether the body falls down the inside of the curve BAD, by the force of gravity, or is retained in it by the action of the string: for they will both have the same effect; and it is otherwise known, from the oblique descents of bodies, that the body will descend and ascend along the curve in the manner above described.

Experience also confirms this theory, in any finite number of oscillations. But if they are supposed infinitely continued, a difference will arise. For the resistance of the air, and the friction and rigidity of the string about the centre C, will take off part of the force acquired in falling; whence it happens that it will not rise precisely to the same point from whence it fell.

Thus, the ascent continually diminishing the oscillation, this will be at last stopped, and the pendulum will hang at rest in its natural direction, which is perpendicular to the horizon.

Now, as to the real time of oscillation in a circular arc BAD; it is demonstrated by mathematicians, that if $p = 3.1416$, denote the circumference of a circle whose diameter is 1; $g = 16\frac{1}{2}$ feet, or 193 inches, the space a heavy body falls in the first second of time; and $r = CA$, the length of the pendulum; also $a = AE$, the height of the arch of vibration; then the time of each oscillation in the arc BAD, will be equal to $p\sqrt{\frac{r}{2g}}$

× the infinite series $1 + \frac{1^2a}{2^2d} + \frac{1^2.3^2a^2}{2^2.4^2d^2} + \frac{1^2.3^2.5^2a^3}{2^2.4^2.6^2d^3}$ &c. where $d = 2r$ is the diameter of the arc described, or twice the length of the pendulum.

And here, when the arc is a small one, as in the case of the vibrating pendulum of a clock, all the terms of this series after the $2d$ may be omitted, on account of their smallness; and then the time

of a whole vibration will be nearly equal to $p\sqrt{\frac{r}{2g}}$

× $(1 + \frac{a}{8r})$. So that the times of vibration of a pendulum in different small arcs of the same circle, are as $8r + a$; or 8 times the radius, added to the versed sine of the semi-arc.

And farther, if D denotes the number of degrees in the semi-arc AB, whose versed sine is a , then the quantity last mentioned, for the time of

a whole vibration, is changed to $p\sqrt{\frac{r}{2g}} \times (1 + \frac{D^2}{52524})$. And therefore the times of vibra-

tion in different small arcs are as $52524 + D^2$, or as the number 52524 added to the square of the number of degrees in the semi-arc AB.

2. Let CB, fig. 2, pl. 132, be a semicycloid, having its base EC parallel to the horizon, and its vertex B downwards; and let CD be the other

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 5.

Fig. 6.

P E N D U L U M.

half of the cycloid, in a similar position to the former. Suppose a pendulum-string of the same length with the curve of each semicycloid BC or CD, having its end fixed in C, and the thread applied all the way close to the cycloidal curve BC, and consequently the body or pendulum-weight coinciding with the point B. If now the body is let go from B, it will descend by its own gravity, and in descending it will unwind the string from off the arch BC, as at the position CGH; and the ball G will describe a semicycloid BHA, equal and similar to BGC, when it has arrived at the lowest point A; after which it will continue its motion, and ascend by another equal and similar semicycloid AKD, to the same height D, as it fell from at B, the string now wrapping itself upon the other arch CID. From D it will descend again, and pass along the whole cycloid DAB, to the point B; and thus perform continual successive oscillations between B and D, in the curve of a cycloid; as it before oscillated in the curve of a circle, in the former case.

This contrivance to make the pendulum oscillate in the curve of a cycloid is the invention of the celebrated Huygens, to make the pendulum perform all its vibrations in equal times, whether the arch, or extent of the vibration, is great or small; which is not the case in a circle, where the larger arcs take a longer time to run through them than the smaller ones do, as is well known both from theory and practice.

The chief properties of the cycloidal pendulum then, as demonstrated by Huygens, are the following: 1st. That the time of an oscillation in all arcs, whether larger or smaller, is always the same quantity, viz. whether the body begins to descend from the point B, and describes the semi-arch BA; or that it begins at H, and describes the arch HA; or that it sets out from any other point; as it will still descend to the lowest point A in exactly the same time. And it is farther proved, that the time of a whole vibration through any double arc BAD or HAK, &c. is in proportion to the time in which a heavy body will freely fall, by the force of gravity, through a space equal to $\frac{1}{2}AC$, half the length of the pendulum, as the circumference of a circle is to its diameter. So that, if $g = 16\frac{1}{2}$ feet denotes the space a heavy body falls in the first second of time, $p = 3.1416$ the circumference of a circle whose diameter is 1, and $r = AC$ the length of the pendulum; then, because by the nature of descents by gravity,

$\sqrt{g} : \sqrt{\frac{1}{2}r} :: 1'' : \sqrt{\frac{r}{2g}}$, that is, the time in which a body will fall through $\frac{1}{2}r$, or half the length of the pendulum; therefore, by the above proportion, as $1 : p :: \sqrt{\frac{a}{2g}} : p \sqrt{\frac{r}{2g}}$, which is the time of an entire oscillation in the cycloid.

And this conclusion is abundantly confirmed by experience. For example: if we consider the time of a vibration as 1 second, to find the length of the pendulum that will so oscillate in 1 second;

this will give the equation $p \sqrt{\frac{r}{2g}} = 1$; which reduced, gives $r = \frac{2g}{p^2} = \frac{386}{3.1416^2}$ inches = 39.11,

or 39 $\frac{1}{4}$ inches, for the length of the second's pendulum; which the best experiments show to be about 39 $\frac{1}{4}$ inches.

3. Hence also, we have a method of determining, from the experimented length of a pendulum, the space a heavy body will fall perpendicularly

through in a given time; for, since $p \sqrt{\frac{r}{2g}} =$

1, therefore, by reduction, $g = \frac{1}{2} p^2 r$ is the space a body will fall through in the first second of time, when r denotes the length of the second's pendulum; and a constant experience shows that this length is nearly 39 $\frac{1}{4}$ inches, in the latitude of London, in this case g , or $\frac{1}{2} p^2 r$, becomes $\frac{1}{2} \times 3.1416^2 \times 39\frac{1}{4} = 193.07$ inches = 16 $\frac{1}{2}$ feet, very nearly, for the space a body will fall in the first second of time, in the latitude of London: a fact which has been abundantly confirmed by experiments made there. And in the same manner, Mr. Huygens found the same space fallen through at Paris to be 15 French feet.

The whole doctrine of pendulums oscillating between two semicycloids, both in theory and practice, was delivered by that author, in his *Horologium Oscillatorium, sive Demonstrationes de Motu Pendulorum*. And every thing that regards the motion of pendulums has since been demonstrated in different ways, and particularly by Newton, who has given an admirable theory on the subject, in his *Principia*, where he has extended to epicycloids the properties demonstrated by Huygens of the cycloids.

4. As the cycloid may be considered as coinciding in A, with any small arc of a circle described from the centre C, passing through A, where it is known the two curves have the same radius and curvature; therefore the time in the small arc of such a circle, will be nearly equal to the time in the cycloid; so that the times in very small circular arcs are equal, because these small arcs may be considered as portions of the cycloid, as well as of the circle. And this is one great reason why the pendulums of clocks are made to oscillate in as small arcs as possible, viz. that their oscillations may be the nearer to a constant equality.

This may also be deduced from a comparison of the times of vibration in the circle, and in the cycloid, as laid down in the foregoing articles. It has there been shown, that the times of vibration in the circle and cycloid are thus, viz. time in the

circle nearly $p \sqrt{\frac{r}{2g}} \times (1 + \frac{a}{8r})$, time in the

cycloidal arc $p \sqrt{\frac{r}{2g}}$; where it is evident that

the former always exceeds the latter in the ratio

of $1 + \frac{a}{8r}$ to 1; but this ratio always approaches

nearer to an equality, as the arc, or as its versed sine a , is smaller; till at length, when it is very

small, the term $\frac{a}{8r}$ may be omitted, and then the

times of vibration become both the same quantity,

viz. $p \sqrt{\frac{r}{2g}}$.

Farther, by the same comparison, it appears, that the time lost in each second, or in each vibration of the seconds pendulum, by vibrating

in a circle, instead of a cycloid, is $\frac{a}{8r}$, or

$\frac{D^2}{52524}$; and consequently the time lost in a

whole day of 24 hours, is $\frac{1}{2} D^2$ nearly. In like manner, the seconds lost per day by vibrating in the arc of Δ degrees, is $\frac{1}{2} \Delta^2$. Therefore, if the pendulum keeps true time in one of these arcs, the seconds lost or gained per day, by vibrating

P E N D U L U M.

in the other, will be $\frac{1}{4}(D^2 - \Delta^2)$. So, for example, if a pendulum measures true time in an arc of 3 degrees, on each side of the lowest point, it will lose $11\frac{1}{2}$ seconds a day by vibrating 4 degrees; and $26\frac{1}{2}$ seconds a day by vibrating 5 degrees; and so on.

5. The action of gravity is less in those parts of the earth where the oscillations of the same pendulum are slower, and greater where these are swifter; for the time of oscillation is reciprocally proportional to $\sqrt{g}$. And it being found by experiment, that the oscillations of the same pendulum are slower near the equator, than in places farther from it; it follows that the force of gravity is less there; and consequently the parts about the equator are higher or farther from the centre, than the other parts; and the shape of the earth is not a true sphere, but somewhat like an oblate spheroid, flattened at the poles, and raised gradually towards the equator. And hence also the times of the vibration of the same pendulum, in different latitudes, afford a method of determining the true figure of the earth, and the proportion between its axis and the equatorial diameter.

Thus, M. Richer found by an experiment made in the island of Cayenne, about 4 degrees from the equator, that a pendulum 3 feet $8\frac{1}{2}$ lines long, which at Paris vibrated seconds, required to be shortened a line and a quarter to make it vibrate seconds. And many other observations have confirmed the same principle. See Newton's Principia, lib. iii. prop. 20. By comparing the different observations of the French astronomers, Newton apprehends that 2 lines may be considered as the length a second's pendulum ought to be decreased at the equator.

From some observations made by Mr. Campbell, in 1731, in Black-river, in Jamaica, 18° north latitude, it is collected, that if the length of a simple pendulum that swings seconds in London is 39.126 English inches, the length of one at the equator would be 39.02, and at the poles 39.197.

And hence Mr. Emerson has computed the following table, showing the length of a pendulum that swings seconds at every 5th degree of latitude.

Degrees of Latitude.	Length of Pendulum.	Degrees of Latitude.	Length of Pendulum.	Degrees of Latitude.	Length of Pendulum.
	Inches.		Inches.		Inches.
0	39.027	35	39.084	65	39.168
5	39.029	40	39.097	70	39.177
10	39.032	45	39.111	75	39.185
15	39.036	50	39.126	80	39.191
20	39.044	55	39.142	85	39.195
25	39.057	60	39.158	90	39.197
30	39.070				

6. If two pendulums vibrate in similar arcs, the times of vibration are in the sub-duplicate ratio of their lengths. And the lengths of pendulums vibrating in similar arcs, are in the duplicate ratio of the times of a vibration directly; or in the reciprocal duplicate ratio of the number of oscillations made in any one and the same time.

For, the time of vibration t being as $p \sqrt{\frac{r}{2g}}$ where p and g are constant or given, therefore t is as $\sqrt{r}$, and r as t^2 . Hence therefore the length

of a half-second pendulum will be $\frac{1}{4}r$, or $\frac{39\frac{1}{2}}{4} = 9.781$ inches; and the length of the quarter-second pendulum will be $\frac{1}{16}r = \frac{39\frac{1}{2}}{16} = 2.445$ inches; and so of others.

7. The foregoing laws, &c. of the motion of pendulums, cannot strictly hold good, unless the thread that sustains the ball is void of weight, and the gravity of the whole ball is collected into a point. In practice, therefore, a very fine thread, and a small ball, but of a very heavy matter, are to be used. But a thick thread, and a bulky ball, disturb the motion very much; for in that case, the simple pendulum becomes a compound one; it being much the same thing, as if several weights were applied to the same inflexible rod in several places.

8. Mr. Krafft, in the new Petersburg Memoirs, vols. 6 and 7, has given the result of many experiments upon pendulums, made in different parts of Russia, with deductions from them, from whence he derives this theorem: if x is the length of a pendulum that swings seconds in any given latitude l , and in a temperature of 10 degrees of Reaumur's thermometer, then will the length of that pendulum, for that latitude, be thus expressed, viz.

$x = (439.178 + 2.321 + \sin 2l)$ lines of a French foot. And this expression agrees very nearly, not only with all the experiments made on the pendulum in Russia, but also with those of Mr. Graham, and those of Mr. Lyons in $79^\circ 50'$ north latitude, where he found its length to be 441.38 lines, and as well as the recent experiments and computations of the French philosophers.

Rule. To find the length of a pendulum to make any number of vibrations, and *vice versa*. Call the pendulum making 60 vibrations the standard length; then say, as the square of the given number of vibrations is to the square of 60; so is the length of the standard to the length sought. If the length of the pendulum be given, and the number of vibrations it makes in a minute be required; say, as the given length is to the standard length, so is the square of 60, its vibrations in a minute, to the square of the number required. The square root of which will be the number of vibrations made in a minute.

From this rule it is easy to find that a pendulum 52.02982 inches long, will vibrate as often in a minute, as it is inches in length.

One that is 3.994805 inches long, will vibrate as often in a second, as it is inches in length.

Angular pendulum, is formed of two pieces or legs like a sector, and is suspended by the angular point. This pendulum was invented with a view to diminish the length of the common pendulum, but at the same time to preserve or even increase the time of vibration. In this pendulum, the time of vibration depends on the length of the legs, and on the angle contained between them conjointly, the duration of the time of vibration increasing with the angle. Hence a pendulum of this construction may be made to oscillate in any given time. At the lower extremity of each leg of the pendulum is a ball or bob as usual. It may be easily shown, that in this kind of pendulum, the squares of the times of vibration are as the secants of half the angle contained by the legs: hence, if a pendulum of this construction vibrates half seconds when its legs are close, it will vibrate whole seconds when the legs are opened, so as to contain an angle equal to $151^\circ 2\frac{1}{2}'$.

P E N D U L U M.

If the two cylindrical legs of an angular pendulum are each 15 inches, and they make an angle of $150^{\circ} 23'$, the time of vibration will be 1 second; if the angle be increased to $178^{\circ} 49\frac{1}{2}'$, while the legs continue of the same length, the time of vibration would be 5 seconds. (Gregory's *Mechanics*, vol. i. p. 269.)

If an isosceles right angled triangle be suspended at its vertex, the centre of oscillation will be in the middle of its base; and if a right angled cone be suspended at its vertex, the centre of oscillation will be in the centre of the base: in either case, therefore, the time of vibration will be the same as that of a simple pendulum whose length is equal to the altitude of the triangle or of the cone. Other pendulums whose lengths shall be equal to the distance between the point of suspension and the centre of oscillation, may be readily found from the known expressions for the centre of oscillation. Thus, in a parabola vibrating in its own plane and suspended at its vertex, the distance of the centre of oscillation from that vertex is $\frac{1}{2}$ axis + $\frac{1}{4}$ parameter: and when this expression is equal to the axis, the base of the parabola will be to its axis, as 1:85164 to 1.

The conical or circular pendulum, is so called from the figure described by the string or ball of the pendulum. This pendulum was invented by Mr. Huygens, and is also claimed by Dr. Hook.

In order to understand the principles of this pendulum, it will be necessary to premise the following lemma, viz. The times of all the circular revolutions of a heavy globular body, revolving within an inverted hollow paraboloid, will be equal, whatever be the radii of the circles described by that body.

In order, therefore, to construct the pendulum so that its ball may always describe its revolutions in a paraboloid surface, it will be necessary that the rod of the pendulum be flexible, and that it be suspended in such a manner as to form the evolute of the given parabola. Hence, let KH (fig. 3, pl. 132) be an axis perpendicular to the horizon, having a pinion at K moved by the last wheel in the train of the clock; and a hardened steel point at H moving in an agate pivot, to render the motion as free as possible. Now, let it be required that the pendulum shall perform each revolution in a second, then the paraboloid surface it moves in must be such whose *latus rectum* is double the length of the common half-second pendulum. Let O be the focus of the parabola MEC, and MC the *latus rectum*; and make $AE = MO = \frac{1}{2}MC$ = the length of a common half-second pendulum. At the point A of the verge, let a thin plate AB be fixed at one end, and at the other end B let it be fastened to a bar or arm BD perpendicular to DH, and to which it is fixed at the point D. The figure of the plate AB is that of the evolute of the given parabola MEC.

The equation of this evolute, being also that of the semicubical parabola, is $\frac{27}{16} p x^2 = y^3$.—Let

$\frac{27}{16} p = P$; then $P x^2 = y^3$, and in the focus $P = 2 y$.

In this case $2 x^2 = y^2 = \frac{1}{4} P^2$: hence $x^2 = \frac{1}{8} P^2$, and x

$= P \sqrt{\frac{1}{8}} = \frac{27}{16} p \sqrt{\frac{1}{8}}$ = the distance of the focus from the vertex A. By assuming the value of x , the ordinates of the curve may be found; and hence it may be easily drawn.

The string of the pendulum must be of such a

length, that when one end is fixed at B, it may lie over the plate AB, and then hang perpendicular from it, so that the centre of the bob may be at E when at rest. Now the verge KH being put into motion, the ball of the pendulum will begin to gyrate, and thereby conceive a centrifugal force which will carry it out from the axis to some point F, where it will circulate seconds or half-seconds, according as the line AE is 9.8 inches, or $2\frac{1}{4}$ inches, and AB answerable to it.

One advantage possessed by a clock having a pendulum of this construction is, that the second hand moves in a regular and uniform manner, without being subject to those jerks or starts as in common clocks; and the pendulum is entirely silent.

The conical pendulum has been very ingeniously employed as a regulator by Messrs. Boulton and Watt, in their steam engines. See STEAM ENGINE.

The greatest inconvenience attending the pendulum is, that it is constantly liable to an alteration of its length, from the effects of heat and cold, which very sensibly expand and contract all metalline bodies. See HEAT, PYROMETER, &c.

To remedy this inconvenience, the common method is by applying the bob of the pendulum with a screw; so that it may be at any time made longer or shorter, according as the bob is screwed downwards or upwards, and thereby the time of its vibrations kept always the same. Again, if a glass or metalline tube, uniform throughout, filled with quicksilver, and 58.8 inches long, were applied to a clock, it would vibrate seconds for $39.2 = \frac{2}{3}$ of 58.8, and such a pendulum admits of a two-fold expansion and contraction, viz. one of the metal and the other of the mercury, and these will be at the same time contrary, and therefore will correct each other. For by what we have shown, the metal will extend in length with heat, and so the pendulum will vibrate slower on that account. The mercury also will expand with heat, and since by this expansion it must extend the length of the column upward, and consequently raise the centre of oscillation; so that by this means its distance from the point of suspension will be shortened, and therefore the pendulum on this account will vibrate quicker; wherefore, if the circumstances of the tube and mercury are skillfully adjusted, the time of the clock might, by this means, for a long course of time, continue the same, without any sensible gain or loss. This was the invention of Mr. Graham, in the year 1721, who made a clock of this sort, and compared it with one of the best of the common sort for three years together, and found the errors of the former but about one-eighth part of the latter.

Mr. Graham also made a pendulum consisting of three bars, one of steel between two of brass, and the steel bar acted upon a lever, so as to raise the pendulum, when lengthened by heat, and to let it down, when shortened by cold; but he found this clock liable to sudden starts and jerks in this motion.

The ingenious Mr. Ellicott, in the Transactions of the Royal Society, describes a pendulum of his invention, composed of brass and iron, with the method of applying it, so as to avoid the many jerks to which the machine might be liable.

But besides the irregularities arising from heat and cold, pendulum clocks are liable to others from friction and foulness; to obviate which, Mr. Harrison has several excellent contrivances,

P E N D U L U M.

whereby his clocks are almost entirely free from friction, and never need to be cleaned.

The gridiron pendulum is a contrivance for the same purpose. Instead of one rod, this pendulum is composed of any convenient odd number of rods, as five, seven, or nine; being so connected, that the effect of one set of them counteracts that of the other set; and therefore, if they are properly adjusted to each other, the centres of suspension and oscillation will always be equidistant. Fig. 4 represents a gridiron pendulum composed of nine rods, steel and brass alternately. The two outer rods, AB, CD, which are of steel, are fastened to the cross pieces AC, BD, by means of pins. The next two rods, EF, GH, are of brass, and are fastened to the lower bar BD, and to the second upper bar EG. The two following rods are of steel, and are fastened to the cross bars EG and IK. The two rods adjacent to the central rod being of brass, are fastened to the cross pieces IK and LM; and the central rod, to which the ball of the pendulum is attached, is suspended from the cross piece LM, and passes freely through a perforation in each of the cross bars IK, BD. From this disposition of the rods, it is evident that, by the expansion of the extreme rods, the cross piece BD, and the two rods attached to it, will descend: but since these rods are expanded by the same heat, the cross piece EG will consequently be raised, and therefore also the two next rods; but because these rods are also expanded, the cross bar IK will descend; and by the expansion of the two next rods, the piece LM will be raised a quantity sufficient to counteract the expansion of the central rod. Whence it is obvious, that the effect of the steel rods is to increase the length of the pendulum in hot weather, and to diminish it in cold weather, and that the brass rods have a contrary effect upon the pendulum. The effect of the brass rods must, however, be equivalent not only to that of the steel rods, but also to the part above the frame and spring, which connects it with the cock, and to that part between the lower part of the frame and the centre of the ball.

Another excellent contrivance for the same purpose is described in a French author on clock-making. It was used in the north of England by an ingenious artist about fifty years ago. This invention is as follows: a bar of the same metal with the rod of the pendulum, and of the same dimensions, is placed against the back-part of the clock-case: from the top of this a part projects, to which the upper part of the pendulum is connected by two fine pliable chains or silken strings, which just below pass between two plates of brass, whose lower edges will always terminate the length of the pendulum at the upper end. These plates are supported on a pedestal fixed to the back of the case. The bar rests upon an immovable base at the lower part of the case; and is inserted into a groove, by which means it is always retained in the same position. From this construction, it is evident that the extension or contraction of this bar, and of the rod of the pendulum, will be equal, and in contrary directions. For suppose the rod of the pendulum to be expanded any given quantity by heat; then, as the lower end of the bar rests upon a fixed point, the bar will be expanded upwards, and raise the upper end of the pendulum just as much as its length was increased; and hence its length below the plates will be the same as before.

It has been supposed by several, that the tubu-

lar pendulum (which is also a modification of Harrison's compensation) is but a very recent invention: but the writer of the article *Clock* in the *British Encyclopædia* met with one by accident which was made upwards of thirty years ago; and thinks it but justice, both to the public and the ingenious artist who directed its construction, to oppose this opinion. This pendulum is in possession of Mr. Patoureaux, watch and clock-maker, 15, Wardour-street. It was made by Mr. William Brown, a clock-maker well known to the trade, who has been dead upwards of five years, and who formerly resided near the Seven Dials. His brother, a jeweller, residing in 15, Coventry-court, Haymarket, was his executor, and sold the pendulum to Mr. Barrett, clock-maker, of Compton-street, some years ago, from whence Mr. Patoureaux bought it. Mr. Brown, the jeweller, informed the writer that this pendulum had been made by his brother upwards of thirty years ago, just after he had served his time to Mr. Chandler, then of King-street, Seven Dials (whom he afterwards succeeded in his business); and that it was made by direction of Mr. Chandler, who, as far as he knew, was the inventor of it: and in corroboration of this assertion, Mr. Hampson, working clock-maker, 22, Greek-street, Soho, declares, that he made several pendulums of the same construction for Mr. Brown, upwards of seven years ago. This tubular pendulum, which at present we must attribute to the ingenuity of Mr. Chandler, is composed of two tubes and a rod of iron, and two tubes of brass. The iron rod is about a quarter of an inch in diameter, and is suspended by a spring in the common manner: it is inclosed by the first brass tube, to which it is connected at bottom: an iron tube, supported by the top of the brass tube, then descends a little below it, and supports by its lower extremity the second brass tube, which rises a little above the former tubes, and from the top of it the second iron tube descends below all about two inches into the substance of the pendulum bob, which is very large and heavy: the bottom of this last tube contains a nut, into which a screw (having a milled head beneath that sustains the bob), passes from below, and raises or lowers the bob, as required for the adjustment of the rate of going of the clock. We may date the invention of the tubular pendulum, from the foregoing information, about the year 1775, though it may yet be found to be of a still earlier period. The foreman of Mr. Villaumy, clock-maker to the Prince of Wales, Pall-mall, declares, that he remembers a tubular pendulum to have been made by Mr. Finney, a well-known clock-maker of Liverpool, upwards of forty years ago, and that it is now in the possession of Mr. De Membry, of Richmond; but space will not permit the farther investigation of this point at present.

The modification of the longitudinal compensation made public by Mr. Troughton, mathematical instrument-maker, differs from Chandler's tubular pendulum, in having but two tubes of brass, which afford the ascending compensations, while the descending ones are performed by five wires of steel. The order of brass and steel is the same as in Chandler's pendulum; but all the steel wires pass downwards through the internal brass tube. The last pair of wires connect the whole with the bob by a short cylindrical piece of brass, to which the bob is suspended by its centre.

Mr. Troughton made this pendulum in July,

P E N D U L U M.

1804, and published the first account of it in December same year, in Nicholson's Philosophical Journal: we believe he knew nothing of the priority of Chandler's tubular pendulum to his, and that in thinking and declaring himself the first inventor of tubular pendulums, he only fell into an error common to many other ingenious men on similar occasions; and this error is the more excusable, as at the time Chandler made his pendulum there were no periodical works in existence which professedly recorded the improvements of arts and manufactures, and artists were in general more careful to conceal their discoveries than to acquire reputation by making them public.

Before concluding the enumeration of various sorts of pendulums, one suggested by Mr. Troughton should be noticed, which seems worthy of trial. He proposes that its rod should be made of baked potter's earth, of the same composition as Wedgwood's thermometer, and furnished with a metallic cap, by which it should be sustained by the knife-edge suspension, which the celebrated Berthoud affirms has less friction than the spring suspension.

The chief advantages which tubular pendulums have over those of the gridiron construction are, that they admit of being much lighter above the bob with equal strength; that they experience less resistance from the air in their vibrations; and that they are less liable to those shakes and irregular motions in their expansions which the others experience: on the other hand, as the outside tube alone in them comes in contact with the air through which it passes in its vibrations, the inner tubes can receive much less of its influence as to temperature, which arises from this motion, and which Cummings has shown to be of considerable consequence. In Troughton's pendulum the great difference of the masses of matter between the ascending and descending parts must be another source of error, as the small wires of which the latter consist indubitably will much sooner experience the influence of a change of temperature in the air than the more bulky substance of the tubes. In this latter respect Chandler's tubular pendulum seems superior to Troughton's, all its parts being much more nearly of the same magnitude.

The last compensation pendulum we shall mention is that of Mr. Adam Reid, a very ingenious mechanist at Woolwich. It is made of steel and zinc, the proportions of the respective parts being adjusted according to their several powers of expansion. The following are Mr. Reid's directions. Procure a rod of forged blister-steel 52.7 inches long, .27 diameter, heat it to a white heat, which will open the pores of the steel, and give it the smallest expansive power that steel of that texture is possessed of; when cold, straighten it with a mallet of wood on a wooden block, that no part may be condensed partially, which would be the case if a hammer and anvil were used. Then cast a solid rod of zinc 12.5 inches long, .68 diameter, with the lowest heat that will fuse it; pour it into a metal mould: this will give it the greatest density, consequently the greatest expansion that zinc is possessed of. Then bore a hole through the centre of it longitudinally, that it may move freely at the steel rod, which has a nut and screw at the bottom end to regulate the clock to mean time; the bob, as shown in fig. 5, plate 132, rests on the upper end of the cylinder of zinc, and will continue in the same place, what-

ever expansion or contraction takes place, if the adjustment be correct.

If platina were used instead of steel, and steel instead of zinc, a pendulum might be made equally good, and more compact; but not at so small an expence. The dimensions above specified are for a second's pendulum in its finished state.

To give all possible perspicuity to this description, figs. 5 and 6, pl. 132, are added: where AB represents the steel rod extending through the whole. C the bob, supported upon the compensating cylinder of zinc D, which surrounds the rod AB, and rests upon the nut E of a screw tapped upon the end of the steel rod, to bring it to exact time; as this expands downwards by heat, the zinc expands upwards the same quantity; so that the bob always remains at the same distance from the point of suspension. Fig. 6 is a section to show more clearly the thickness of the zinc tube D, and the form of the steel rod at *a*, where it passes through the bob, it being there of the transverse shape shown at L, that the rod or the bob may not turn round when the nut E is turned to adjust it to time.

Fifteen guineas were voted to Mr. Reid by the society, as a compliment for this truly ingenious invention.

PENDULUM-CLOCK is a clock having its motion regulated by the vibration of a pendulum.

It is controverted between Galileo and Huygens, which of the two first applied the pendulum to a clock.

After Huygens had discovered that the vibration made in arcs of a cycloid, however unequal they might be in extent, were all equal in time; he soon perceived, that a pendulum applied to a clock, so as to make it describe arcs of a cycloid, would rectify the otherwise unavoidable irregularities of the motion of the clock; since, though the several causes of those irregularities should occasion the pendulum to make greater or smaller vibrations, yet, by virtue of the cycloid, it would still make them perfectly equal in point of time; and the motion of the clock governed by it would therefore be preserved perfectly equable. But the difficulty was, how to make the pendulum describe arcs of a cycloid; for naturally the pendulum, being tied to a fixed point, can only describe circular arcs about it.

Here Mr. Huygens contrived to fix the iron rod or wire, which bears the ball or weight at the top, to a silken thread, placed between two cycloidal cheeks, or two little arcs of a cycloid, made of metal. Hence the motion of vibration, applying successively from one of those arcs to the other, the thread, which is extremely flexible, easily assumes the figure of them, and by that means causes the ball or weight at the bottom to describe a just cycloidal arc.

This is doubtless an ingenious invention, more especially as it gave rise to the whole doctrine of involute and evolute curves, with the radius and degree of curvature, &c.

But it is not of any essential service in the practice of clock-making; for the isochronism of vibrations in cycloidal arcs is demonstrated upon the supposition that the whole mass of the pendulum is concentrated in a point: a supposition which cannot actually take place in any vibrating body. Many other reasons have induced the artists to abandon the use of the cycloidal pendulum. The principal are, the difficulty with which the metallic cheeks are bent into the true cycloidal

form; the improbability of their long retaining it, supposing it once given; and the changes of which the pendulum is susceptible in consequence of the expansion and contraction by heat and cold. These sources of error are such as the peculiar property of the cycloid cannot obviate: and as the variations from isochronism in very small circular arcs is extremely trifling, the cycloidal pendulum is now wholly disused in practice (*Gregory's Mechanics*, vol. i. p. 230.)

PENELOPE, in fabulous history, a celebrated princess of Greece, daughter of Icarius, of Sparta, and wife of Ulysses, king of Ithaca. She soon after became mother of Telemachus, and was obliged to part with great reluctance from her husband, whom the Greeks obliged to go to the Trojan war. (Vid. **PALAMÉDES**.) The continuation of the war rendered her melancholy; but when Ulysses did not return, like the other princes, her fears were increased, and she was soon beset by a number of suitors, who wished her to believe that her husband was shipwrecked. She received their addresses with disdain; she yet flattered them with hopes, and declared that she would make choice of one of them, as soon as she had finished a piece of tapestry then in hand; but she baffled their eager expectations by undoing in the night what she had done in the day-time. This artifice of Penelope has given rise to the proverb of *Penelope's web*, which is applied to whatever labour can never be ended. The return of Ulysses, after an absence of twenty years, however, delivered her from her dangerous suitors. (*Homer, Ovid, &c.*) Penelope is described by Homer as a model of female virtue and chastity; but some more modern writers dispute her claims to modesty and continence, representing her as the most debauched and voluptuous of her sex.

PENELOPE, in zoology, a genus of the class aves, order gallinæ. Bill naked at the base; head covered with feathers; chin naked; tail with twelve feathers; legs spurless. Four species; in Linnæus six; two of which last, however, do not properly belong to this genus.

1. *P. cristata* Guan. Head with an erect crest; temples violet; bill black; irids orange; nostrils reaching from the middle of the bill to the front; orbits violet; caruncle on the chin compressed, red, covered with a few hairs; crest oblong; body black-green; back brown; neck, breast, and belly spotted with white; legs red. Inhabits Brazil and Guiana; two and a half feet long. They are often tamed; and make a noise not unlike the sound *jacu*: flesh accounted good.

2. *P. cumanensis*. Yacou. Blackish; crest and first quill-feathers white; irids brownish; orbits and chin naked, blueish; body beneath speckled with white; tail long, even; legs red. Inhabits Cayenne and Guiana; size of a hen-turkey; erects the crest and spreads its tail; builds on the ground, or in low trees. At Cayenne it is tamed, becomes familiar, and will mix with other poultry,

3. *P. pipile*. Piping curassow, Caruncle

on the chin blue; belly black; back brown, spotted with black; wing-coverts and first quill-feathers white; legs red. Inhabits with the last: voice weak, piping.

4. *P. maril*, Marail. Greenish-black; naked orbits, and legs red; throat nakedish, speckled with white; bill and irids blackish; head crested. The crest erected when the bird is irritated; wings short; tail long, even, often erected and expanded. Inhabits in flocks in the woods of Guiana; roosts in trees whose food it feeds upon; emits a disagreeably harsh cry.

PENETRABILITY. *s.* (from *penetrable*.) Susceptibility of impression from another body (*Cheyne*).

PENETRABLE. *a.* (*penetrable*, Fr. *penetrabilis*, Latin.) 1. Such as may be pierced; such as may admit the entrance of another body (*Dryden*). 2. Susceptive of moral or intellectual impression (*Shakspeare*).

PENETRAIL. *s.* (*penetralia*, Latin.) Interior parts: not in use (*Harvey*).

PENETRANCY. *s.* (from *penetrant*.) Power of entering or piercing (*Ray*).

PENETRANT. *a.* (*penetrant*, French.) Having the power to pierce or enter; sharp; subtle (*Boyle*).

To PENETRATE. *v. a.* (*penetrer*, Fr.)

1. To pierce; to enter beyond the surface; to make way into a body (*Arbutnot*). 2. To affect the mind. 3. To teach the meaning (*Ray*).

To PENETRATE. *v. n.* 1. To make way (*Pope*). 2. To make way by the mind (*Locke*).

PENETRATION. *s.* (*penetration*, Fr.)

1. The act of entering into any body (*Milton*). 2. Mental entrance into any thing abstruse. 3. Acuteness; sagacity (*Watts*).

PENETRATIVE. *a.* (from *penetrate*.)

1. Piercing; sharp; subtle (*Wotton*). 2. Acute; sagacious; discerning (*Swift*). 3. Having the power to impress the mind (*Shakspeare*).

PENETRATIVENESS. *s.* (from *penetrative*.) The quality of being penetrative.

PENGUIN, in ornithology. See **ALCA** and **APTENODYTES**.

PENGUIN, in botany. See **BROMELIA**.

PENICILLIFORM APPENDIX. In botany, an appendix to the keel of the corol in some sorts of polygala; in shape of a painter's pencil.

PENICILLIFORM STIGMA. A pencil-shaped stigma; as in milium.

PENICILLUM, in anatomy. See **ACINIBILIOSI**.

PENINSULA. *s.* (Latin, *pene insula*.) A piece of land almost surrounded by the sea.

PENINSULATED. *a.* (from *peninsula*.) Almost surrounded by water.

PENIS. (*penis*, a *pendendo*, from its hanging down.) Membrum virile. The cylindrical part that hangs down under the mons veneris before the scrotum of males. It is divided by anatomists into the root, body, and

head, called the glans penis. It is composed of common integuments, two corpora cavernosa, and one corpus spongiosum, which surrounds a canal, the urethra, that proceeds from the bladder to the apex of the penis, where it opens by the meatus urinarius. (See URETHRA.) The fold of the skin that covers the glans penis is termed the prepuce. The arteries of the penis are from the hypogastric and ischiatic. The vein of the penis, vena magna ipsius penis, empties itself in the hypogastric vein. The absorbents of this organ are very numerous, and run under the common integuments to the inguinal glands: absorbents also are found in great plenty in the urethra. The glands of the penis are, Cowper's glands, the prostate, muciparous, and odoriferous glands. The nerves of the penis are branches of the sacral and ischiatic.

PENIS ERECTOR. In myology. See ERECTOR PENIS.

PENISCOLA, a town of Spain, in Valencia, seated on a high point of land, surrounded on three sides by the sea, and of difficult access by land. It is 30 miles S. by W. of Tortosa, and 80 N.N.E. of Valencia. Lon. 0. 24 E. Lat. 40. 24 N.

PENISHEHR, a town of Candahar, in the country of Cabul, 46 miles N. of Cabul.

PENITENCE. *s.* (*penitence*, Fr. *pénitencia*, Latin.) Repentance; sorrow for crimes; contrition for sin, with amendment of life or change of the affections (*Dryden*).

PENITENT. *a.* (*penitent*, Fr. *penitens*, Lat.) Repentant; contrite for sin; sorrowful for past transgressions, and resolutely amending life (*Milton*).

PENITENT. *s.* 1. One sorrowful for sin (*Rogers*). 2. One under censures of the church, but admitted to penance (*Stillfleet*). 3. One under the direction of a confessor.

PENITENTIAL. *a.* (from *penitence*.) Expressing penitence; enjoined as penance (*Shakspeare*).

PENITENTIAL. *s.* (*penitenciel*, Fr. *pénitenciale*, low Latin.) A book directing the degrees of penance (*Ayliffe*).

PENITENTIARY, in the ancient Christian church, a name given to certain presbyters or priests, appointed in every church to receive the private confessions of the people, in order to facilitate public discipline, by acquainting them what sins were to be expiated by public penance, and to appoint private penance for such private crimes as were not proper to be publicly censured.

PENITENTIARY, at the court of Rome, is an office in which are examined and delivered out the secret bulls, graces, or dispensations relating to cases of conscience, confessions, &c.

PENITENTIARY, is also an officer, in some cathedrals, vested with power from the bishop to absolve, in cases reserved to him. The pope has at present his grand penitentiary, who is a cardinal, and the chief of the other penitentiary-priests established in the church of Rome,

who consult him in all difficult cases. He presides in the penitentiary, dispatches dispensations, absolutions, &c. and has under him a regent and 24 proctors, or advocates of the sacred penitentiary.

PENITENTLY. *ad.* (from *penitent*.) With repentance; with sorrow for sin; with contrition.

PENKNIFE. *s.* (*pen and knife*.) A knife used to cut pens (*Bacon*).

PENKRIDGE, a town in Staffordshire, with a market on Tuesday, seated on the river Penk, six miles S. of Stafford, and 129 N.W. of London.

PENKUM, a town of Hither Pomerania, seated on a lake, 15 miles S.W. of Stettin.

PENMAENMAWR, a mountain of Wales, in Carnarvonshire, overhanging the sea. It is four miles W. by S. of Aberconway; and the road to Holyhead crosses it on the side of a dreadful precipice, from which it is defended by a wall. The mountain is 1540 feet above the level of the sea.

PENMAN. *s.* (*pen and man*.) 1. One who professes the art of writing. 2. An author; a writer (*Addison*).

PENMANSHIP. *s.* Writing; that which is effected by the pen.

PENN (William), an English admiral, born at Bristol, in 1621. He commanded with Venables at the taking of Jamaica from the Spaniards, in 1655, and the same year was elected member of parliament for Weymouth. He was committed to the tower by Cromwell, for quitting his command without leave, but was soon released. He was chief commander under the duke of York, in the signal and successful battle with the Dutch fleet, in 1664, and was honoured with knighthood. He died in retirement at Wanstead, in Essex, in 1670.

PENN (William), an eminent quaker and writer, son of the above, was born in the parish of St. Catherine's, near the tower, in 1644. He was put to school, first at Chigwell, in Essex, then to a master on Tower-hill, and lastly under the care of a private tutor. One Thomas Loe, a quaker, is said to have confirmed him in his design of uniting with that sect. He was, with many other persons, taken out of a meeting-house at Cork, and imprisoned; and this unjust persecution on a people for opinion's sake strengthened his affection and ties of union with them. His father, though offended with his son, obtained his release. He was, however, afterwards sent to the tower for a book he had written, and during the seven months he was confined he wrote his famous *No Cross, no Crown*. He was so courageous and able a champion in the cause of his oppressed brethren, as to obtain an order for the release of all in prison. In the next year the conventicle act occasioned his being imprisoned a third time. He was also tried at the Old Bailey for preaching to a seditious assembly. He pleaded his own cause and was acquitted, but the jury were fined, and he

was detained in prison. He obtained his own and their release, probably by the interest of his father, for the quakers deem the payment of a fine an acknowledgment of guilt. His father became perfectly reconciled to him before his death, which happened in 1670, for he said to him, "Son William, let nothing in this world tempt you to wrong your conscience: I charge you do nothing against your conscience. So will you keep peace at home, which will be a feast to you in a day of trouble." He had a controversy with Muggleton, the founder of a sect; and held, near Rickmansworth, a public dispute with the no less famous Richard Baxter. He lived many years at Werminghurst, in Sussex, an estate which he had by his wife Gulielma Maria Springett, whose father had been killed at the siege of Bamber, in the civil wars. From this residence, he went, in company with George Fox and Robert Barclay, on a mission to Holland and Germany. In 1681 king Charles granted him, in lieu of arrears due to his father, the province in North America, till then called the New Netherlands, but since Pennsylvania. Mr. Penn's friendly and pacific manner of treating the Indians produced in them an extraordinary love for him and his people; so that they have maintained a perfect amity with the English in Pennsylvania ever since. He died in 1718, at Jordans, near Beaconsfield, of the effects of three apopleptic fits. He left considerable property behind him, having inherited 1500*l.* a year from his father.

At one period of his life, Penn lodged in a house in Norfolk-street in the Strand. In the entrance to it he had a peeping-hole, through which he could see any person that came to him. A creditor one day sent in his name; and having been made to wait more than a reasonable time, he knocked for the servant, whom he asked, "Will not thy master see me?" "Friend, (answered the servant) he has seen thee, but he does not like thee."

He was the greatest bulwark of the Quakers; in whose defence he wrote numberless pieces. Besides the above works, he wrote a great number of others; the most esteemed of which are, 1. His Primitive Christianity revived. 2. His defence of a paper entitled Gospel Truths, against the Exceptions of the bishop of Cork. 3. His Persuasive to Moderation. 4. His Good Advice to the Church of England, Roman Catholic, and Protestant Dissenter. 5. The sandy Foundation shaken. 6. No Cross, no Crown. 7. The great Case of Liberty of Conscience debated. 8. The Christian Quaker and his Testimony stated and vindicated. 9. A Discourse of the general Rule of Faith and Practice, and Judge of Controversy. 10. England's present Interest considered. 11. An Address to Protestants. 12. His Reflections and Maxims. 13. His Advice to his Children. 14. His Rise and Progress of the People called Quakers. 15. A Treatise on Oaths. Most of these have passed several editions, some of them many. The letters between William Penn

and Dr. Tillotson, and William Penn and William Popple, esq. together with Penn's letters to the princess Elizabeth of the Rhine, and the countess of Hornes, as also one to his wife on his going to Pennsylvania, are inserted in his works, which were first collected and published in 2 vols. folio; and the parts since selected and abridged into 1 vol. folio, are very much and deservedly admired for the good sense they contain.

PENNACHED. *a.* (*pennache*, Fr.) Applied to flowers when the ground of the natural colour of their leaves is radiated and diversified neatly without any confusion (*Tre-voux*).

PENNANT. *s.* (*pennon*, Fr.) 1. A small flag, ensign, or colour. 2. A tackle for hoisting things on board.

PENNANT (Thomas), an able naturalist and antiquary, born at Downing, Flintshire, 1726, and educated at Wrexham school, and Oxford. After examining whatever was curious and valuable in England, he travelled on the continent, and was introduced to the learned of Europe, especially Buffon, Voltaire, Linneus, &c. On his return he commenced author, and from 1750, when his British zoology appeared, to the time of his death, he employed himself in elucidating the history, geography, and natural curiosities of his country. He died at Downing, 1793. His works are numerous, the best known are *tour in Scotland*, 1771, often edited—*tours in Wales*, from Chester to London—*account of London*—*literary memoirs of himself*—a geographical account of India, &c.

PENNANTIA, in botany, a genus of the class polygamia, order dioecia. Calyxless; corol five-petalled; stamens five; stigma flat, peltate; pericarp three-sided, two-celled; seeds solitary. One species, a native of New Zealand.

PENNAR, a river of Hindustan, which rises in Mysore, flows by Gooty, Gandicotta, Cuddapah, and Vellore, and enters the Bay of Bengal, at Gangapatnam.

PENNATA FOLIA, winged leaves, among botanists, are such leaves of plants as grow directly one against another, on the same rib or stalk: as those of ash, walnut tree, &c.

PENNATED. *a.* Winged.

PENNATULA. Sea-pen. In zoology, a genus of the class vermes, order zoophyta. Animal not affixed, of various shapes, supported by a bony part within, naked at the base, the upper part with generally lateral ramifications furnished with rows of tubular denticles, producing radiate polypes from each tube. Eighteen species, scattered through the seas of the globe.

This worm is not a coralline, or alcyony, as being unaffixed to any othersubstance, but in other respects it much resembles these tribes. Its figure is that of a quill-feather of a bird's wing; it is usually about four inches long, and of a red colour; along the back there is a groove from the extremity of the feathered

part, as there is in a pen; the feathered part consists of fins proceeding from the stem; these fins move the animal backward and forward in the water, and are furnished with suckers or mouths armed with filaments. The following are the chief species.

1. *P. corinea*. Stem round, radiating, with papillous, polype-bearing sides, and clavate at the top. Inhabits the deeps of the White Sea, and unites the two genera of alcyonium and pennatula: soft, red, an inch and half high; and as thick as the little finger, wrinkled, with the papillæ disposed in rows.

2. *P. phosphorea*. Stem fleshy; with a rough midrib, and imbricated ramifications. Inhabits most seas, and found in those of our own country; emits a very strong phosphoric light in the dark; about four inches long, red; stem villous; rays nearly incumbent, and all pointing one way.

3. *P. encrinus*. Stem quadrangular, taper, very long, bony, covered with a callous membrane, with an umbellate cluster of polypes from the top. Inhabits the Greenland seas; above six feet long; and when taken fresh from the sea appears like a nosegay of yellow flowers; upper part of umbel composed of from twenty to thirty cylindrical polypes, each with eight claws at the tip, and seated on a long pedicle.

PENNER. *s.* (from *pen*.) 1. Writer. 2. A pence (Ainsworth).

PENNICUIK (Alexander), a Scotch physician. He published a topographical account of Tweedale, some poems, descriptive of the manners of his countrymen, &c. He died 1722, aged 70. It is said that he communicated to Allan Ramsay the incidents which form the subject of his Gentle Shepherd.

PENNILESS. *a.* (from *penny*.) Moneyless; poor; wanting money.

PENNON. *s.* (*pennon*, Fr.) A small flag or colour (Shakspeare).

PENNSYLVANIA, one of the United States of America, 288 miles long and 156 broad; bounded on the N. by New York, E. by that province and New Jersey, S. by Delaware, Maryland, and Virginia, W. by the latter and that of Ohio, and N.W. by Lake Erie, on which it has a considerable front, and a good port. It is divided into 23 counties; viz. Philadelphia, Chester, Delaware, Bucks, Montgomery, Berks, Lancaster, Dauphin, Northampton, Luzerne, York, Cumberland, Northumberland, Franklin, Bedford, Huntingdon, Mifflin, Westmorland, Somerset, Fayette, Washington, Allegany, and Lycoming. It is well watered by the Delaware, Schuylkill, Susquehanna, Monongahela, Allegany, and other navigable rivers. Its produce is corn, cattle, potash, wax, skins, and furs; and the principal manufactures are iron, copper, tin, leather, paper, gunpowder, hats, cotton, sugar, and tobacco. Philadelphia is the capital.

This country was granted to the famous William Penn, son of sir William Penn, ad-

miral of the English fleet, in the time of Oliver Cromwell and Charles II. Sir William, as some reward for his services, and in consideration of sundry debts due to him from the crown, was promised a grant of this country from king Charles II, but died before he obtained it. His son did not for some time apply himself strenuously to solicit the grant promised to his father; but at length finding his friends, the Quakers, were harassed in every part of England by spiritual courts, he renewed his application to the court, and having obtained his grant, went into America, and purchased the soil at a very low rate of the Indians, its original possessors. By this cheap act of justice at the beginning, he rendered all his future dealings the more easy, the Indians having conceived very favourable opinions both of him and his designs. Having thus succeeded in the first part of his plan, he proceeded to the other, namely, to people the country he had thus obtained. And this was greatly facilitated by the uneasiness of the English quakers; who, from their high opinion of the man, determined to follow him over the vast Atlantic Ocean, to a country uncultivated, and a climate strange and unknown. Nor was he himself wanting in any thing that had a tendency to encourage his followers: he expended large sums in transporting and supplying them with all necessaries; and not aiming at a sudden fortune, by selling his lands at a very easy purchase. By this means, and the noble charter of privileges he gave the settlers, the country was soon changed from a wilderness to a garden, and is now one of the most flourishing countries in the new world; and still called after his own name. The climate of Pennsylvania is very agreeable, and the air sweet and clear. The fall, or autumn, begins about the 20th of October, and lasts till the beginning of December, when the winter sets in, which continues till March. Frosty weather, and extreme cold seasons, are frequently known here; so that the river Delaware, though very broad, is oftentimes froze over; but, at the same time, the weather is dry and healthy. The spring lasts from March to June, but the weather is then more inconstant than in the other seasons. The heats are very great in the months of July, August, and September, but mitigated so much by cool breezes, that they are very tolerable. The wind is at south-west during great part of the summer, but generally at north and north-west in spring, fall, and winter; which, blowing over the frozen lakes and snowy mountains of Canada, is the true cause of the coldness of the weather in the winter season. The soil is in some places a yellow or black sand; in some a loamy gravel; and in others a fat mould, like the vales in England, especially near the inland brooks and rivers. The earth is fruitful, fat, and easy to be cleared, the roots of the trees being but a small distance below the surface of the ground. It is well watered with rivers, and produces every thing which can render life agreeable in the utmost plenty. In

short, there is no part of America in a more flourishing condition than Pennsylvania; nay, in some years, more people have transported themselves into this province than in all the others. In the grand convention which was held in Philadelphia, in the summer, 1787, the inhabitants in Pennsylvania were reckoned at 360,000. They are now much more numerous, amounting it is affirmed to about 500,000. The inhabitants of Pennsylvania consist of emigrants from England, Ireland, Germany, and Scotland. The Friends and Episcopalians are chiefly of English extraction, and compose about one-third of the inhabitants. They live principally in the city of Philadelphia, and in the counties of Chester, Philadelphia, Bucks, and Montgomery.

PENNY, or PENY, in commerce, an ancient English coin, which had formerly considerable course; but till lately had dwindled into an imaginary money, or money of account. Camden derives the word from the Latin *pecunia*, money.

The ancient English penny, penig, or pening, was the first silver coin struck in England; nay, the only one current among our Saxon ancestors; as is agreed by Camden, Spelman, Dr. Hicks, &c. The penny was equal in weight to our threepence: five of them made one shilling, or scilling Saxon; 30 a mark or mancuse, equal to our 7s. 6d. Till the time of king Edward I. the penny was struck with a cross, so deeply indented in it, that it might be easily broke, and parted, on occasion, into two parts, thence called half-pennies; or into four, thence called fourthings, or farthings. But that prince coined it without indenture; in lieu of which he first struck round halfpence and farthings.

He also reduced the weight of the penny to a standard; ordering that it should weigh 32 grains of wheat, taken out of the middle of the ear. This penny was called the penny sterling.—Twenty of these pence were to weigh an ounce; whence the penny became a weight as well as a coin. See STERLING and PENNY-WEIGHT.

The modern penny, containing the twelfth part of a shilling, or the 240th part of a pound, is a copper coin of rather variable weight, but not much less than an ounce.

PENNY, in ancient statutes, &c. is used for all silver money; and hence the ward-penny, aver-penny, hundred-penny, tithing-penny, and brothal-penny.

PENNYGANT, one of the highest mountains of England, in Yorkshire, seven miles N. of Settle. Its summit is 3930 feet above the level of the sea. On its sides are two awful orifices, called Hulpit and Huntpit holes; through each of them runs a brook, both of which pass under ground for about a mile, and cross each other in the bowels of the earth without mixing their waters.

PENNY-ROYAL, in botany. See MENTHA PULEGIUM.

PENNY-WEIGHT, a Troy weight, containing 24 grains; each grain weighing a grain

of wheat gathered out of the middle of the ear, well dried. The name took its rise hence, that this was anciently the weight of one of our ancient silver pennies. See PENNY.—Twenty of these penny-weights make an ounce Troy.

PENNYWISE. *a.* (*penny and wise.*) Saving of small sums at the hazard of larger; negligently on improper occasions (*Bacon*).

PENNYWORTH. *s.* (*penny and worth.*) 1. As much as is bought for a penny. 2. Any purchase; any thing bought or sold for money (*South*). 3. Something advantageously bought; a purchase got for less than it is worth (*Dry*). 4. A small quantity (*Swift*).

PENRITH, a town in Cumberland, with a market on Tuesday, and a castle. Several remains of antiquity are seen in its neighbourhood. It is seated under a hill, near the rivers Eymot and Lowther, 18 miles S. of Carlisle, and 280 N.N.W. of London. Lon. 2. 52 W. Lat. 54. 40 N.

PENRUDDOCK (John), was zealous in the cause of his sovereign during the civil wars, and obtained the rank of colonel in the army. He was defeated by Croke, who, after he had promised him pardon, caused him to be beheaded in 1665. The letters which passed between him and his wife, after his condemnation, have been published by Steele, and exhibit him in the amiable light of the good christian and the loyal subject.

PENRYN, a borough in Cornwall, with a market on Wednesday, Friday, and Saturday. It has a great trade in the pilchard and Newfoundland fisheries, is governed by a mayor, and sends two members to parliament. It is seated on a creek of Falmouth Haven, three miles N.W. of Falmouth, and 266 W. by S. of London. Lon. 4. 59 W. Lat. 50. 10 N.

PENSACOLA, the capital of W. Florida, seated on a bay of the gulph of Mexico, which forms a very commodious harbour, where vessels may ride secure from every wind. Lon. 85. 24 W. Lat. 30. 32 N.

PENSANCE, or PENZANCE, a seaport in Cornwall, with a market on Thursday. It was burnt by the Spaniards in 1593, but has been rebuilt, and carries on a considerable traffic in pilchards and tin. It is one of the tin-coinage towns, and a corporation, governed by a mayor. It is seated on a creek of Mounts Bay, 12 miles E. of the Land's End, and 281 W. by S. of London. Lon. 5. 35 W. Lat. 50. 11 N.

PENSFORD, a town in Somersetshire, with a market on Tuesday. It is noted for its hats and bread, and seated on the Chew, seven miles W. of Bath, and 117 W. by S. of London. Lon. 2. 30 W. Lat. 51. 23 N.

PENSILE. *a.* (*pensilis*, Latin.) 1. Hanging; suspended (*Bacon*). 2. Supported above the ground (*Prior*).

PENSILENESS. *s.* (from *pensile*.) The state of hanging.

PENSION. *s.* (*pension*, Fr.) An allowance made to any one without an equivalent (*Add.*)

To PENSION. *v. a.* (from the noun.) To support by an arbitrary allowance (*Addison*).

PENSIONARY. *a.* (*pensionnaire*, French.) Maintained by pensions (*Donne*).

PENSIONER, in general, denotes a person who receives a pension, yearly salary, or allowance. Hence,

The Band of Gentlemen Pensioners, the noblest sort of guard to the king's person consists of 40 gentlemen, who receive a yearly pension of 100*l*.

This honourable band was first instituted by Henry VIII. and their office is to attend the king's person, with their battle-axes, to and from his chapel-royal, and to receive him in the presence-chamber, or coming out of his privy-lodgings; they are also to attend at all great solemnities, as coronations, St. George's feast, public audiences of ambassadors, at the sovereign's going to parliament, &c.

They are each obliged to keep three double horses and a servant, and so are properly a troop of horse. They wait half at a time quarterly; but on Christmas-day, Easter-day, Whitsunday, &c. and on extraordinary occasions, they are all obliged to give their attendance. They have likewise the honour to carry up the sovereign's dinner on the coronation-day and St. George's feast; at which times the king or queen usually confers the honour of knighthood on two such gentlemen of the band as their captain presents. Their arms are gilt battle-axes; and their weapons, on horseback, in time of war, are cuirassiers-arms, with sword and pistols. Their standard in time of war is, argent, a cross gules. Their captain is always a nobleman, who has under him a lieutenant, a standard-bearer, a clerk of the check, secretary, pay-master, and harbinger.

PENSIONER, in the university of Cambridge and in that of Dublin, has a very peculiar meaning; for those students, either undergraduates or bachelors of arts, are called pensioners who live wholly at their own expence, and who receive no emolument whatever from the college of which they are members. They are divided into two kinds, the greater and the less; the former of which are generally called fellow-commoners, because they eat with the fellows of their college; the latter are always called pensioners, and eat with the scholars, who are those students of the college, either undergraduates or bachelors, who are upon the foundation, who receive emoluments from the society, and who are capable of being elected fellows. See *SERVITOR* and *SIZAR*.

PENSIVE. *a.* (*pensif*, Fr. *pensivo*, Italian.) Sorrowfully thoughtful; sorrowful; mournfully serious; melancholy (*Pope*).

PENSIVELY. *ad.* With melancholy; sorrowfully; with gloomy seriousness (*Spenser*).

PENSIVENESS. *s.* (from *pensive*.) Melancholy; sorrowfulness (*Hooker*).

PENSTEMON, in botany, a genus of the class didynamia, order angiospermia. Calyx five-leaved; corol two-lipped, inflated; rudiment of a fifth filament bearded; capsule two-celled. Four species natives of Virginia, or of

Mexico. Of these one, *P. laevigata*, is cultivated in our pleasure gardens, with dichotomous flowering branches, flowers two together, corol pale purple, somewhat hirsute on the outside.

PENSTOCK, a sluice or flood-gate, serving to retain or let go at pleasure the water of a mill-pond, or the like.

PENT. part. pass. of *pen*. Shut up. (*Dryden*).

PENTACAPSULAR. *a.* (*penté* and *capsular*.) Having five cavities.

PENTACHORD. *s.* (*penté* and *χορδή*.) An instrument with five strings.

PENTACOCCEOUS CAPSULE, in botany, a five-grained capsule. Swelling out in five protuberances; or, having five united cells, with one seed in each.

PENTADACTYLON. Five fingers. In botany, a name given by some authors to the ricinus, or palma Christi, from the figure of its leaf.

PENTAGON, in geometry, a plane figure consisting of five angles, and consequently five sides also. If the angles be all equal, it is a regular pentagon.

It is a remarkable property of the pentagon, that its side is equal in power to the sides of a hexagon and a decagon inscribed in the same circle; that is, the square of the side of the pentagon, is equal to both the squares taken together of the sides of the other two figures; and consequently those three sides will constitute a right-angled triangle. To find the area of a regular pentagon, multiply the square of its side into the number 1.7204774.

PENTAGONAL. *a.* Quinquangular; having five angles.

PENTAGONOUS or **PENTAGONAL STEM.** A five-cornered stem. It is a species of Linnéus's ancipital stem, and he seems to distinguish it from quinquangular.—He describes the capsule of euonymus as being pentagona; quinquangularis.

PENTAGRAPH, or **PARALLELOGRAM**, an instrument whereby designs of any kind may be copied in what proportion you please, without being skilled in drawing.

A pentagraph is composed of 4 bars, ABDE, plate 133, fig. 1. usually of brass; the bar A is jointed to B at *b* about the middle, and at *a* it is connected with E: the bar B is the same length as A; and at *d* is jointed to the bar *d*, whose end is connected with the end of E; these four bars form a parallelogram: thus, *ba* = D, and *bd* = E. To the other end of the bar A, a tube F is soldered, through which a pointed brass rod *e*, called the tracer, is put; the end of the bar B has a slider G upon it, which has a tube similar to F; another slider I of the same kind is mounted on the bar D. These sliders have screws, by which they can be fixed at any distance. Under each of the joints of the base a small tube is fixed, in the bottom of which is a small castor as H, which makes the instrument run easily on the table. When the instrument is used, the two sliders GI must be set exactly in a line with the tube

F; when it is required to make a copy of a drawing of the same size, the sliders must be set so that from **F** to **I** is the same distance as from **I** to **G**; the tube **I** must then have a wire put through it, whose lowest end is fast screwed to a heavy leaden weight, **L**; this must have three sharp points in the under side, so that when it is set on the table it may not be liable to move; then if a design or drawing is laid under the tube **F**, and the point of the tracer drawn over the lines of it, the point of the pencil at **G** will describe a similar figure. If the drawing is to be reduced to one-half of the size, the weight must be put to the slider **G**, and the pencil into **I**, without moving either slider; then the distance from the tracer to the fixed point or weight **L**, is twice the distance of the pencil to the weight. The rule for setting the sliders for any proportion is, as the distance between the tracer *e* and the fixed point **L**, is to the distance between the pencil **G** and the same, so is the length of any line described by the tracer, to the length of the line at the same time described by the pencil. To avoid the trouble of measuring these distances each time, the bars **B** and **D** are divided into ten or twenty of the most common proportions, by which divisions the sliders are to be fixed.

The construction of one of the sliders is shewn in fig. 2; where **M** is a piece of brass, to one corner of which a tube *g* is soldered; an opening of the same width as the bar is cut in this, and a cover **N** is screwed on with two screws: this cover has a screw with a mill-head through it, by which the slider is fixed. A piece of brass **O**, a little bent, is put between the bar and the under side of the cover, and whose elasticity prevents the slider moving too freely when the screw is slack, and defends the bar from being scratched by the ends of the screw when it is fixed.

Fig. 3, describes the method of making the joints of the rods: **P** is the end of one bar, which has a steel spindle *p* screwed fast to it; the other bar *o* has a cock *v*, screwed on, whose upper end projects over the tube *t*, and has a hole through it, just over the hole in the tube. The ends of the spindle **P** are put between the holes in the cock and the hole in the tube; if the spindles are well fitted, this joint is very steady, and without any shake. The lower end of the tube *t* has a hole drilled in it, into which the spindle **W** of the castor is put; the castor is kept from falling out of the tube, by the point of a small screw going through the side of the tube *t*, which takes into a notch cut round in the top of the spindle *w*. When the machine is used, a fine line, **RR**, is put through rings in the cocks *bd*, and tied to the pencil; the other end has a loop to be hooked over the thumb of the operator, by pulling which he can raise the pencil at **D**, when he does not wish it to mark.

In order to prove that the figure described by a pentagraph is similar to the given figure; let **C**, fig. 4, be the fixed centre of motion; **P**

the pencil for tracing the given figure **PP**, and *p* the pencil, which traces the other figure *pp*; *p*, &c. must be so adjusted, that *p*, **C** and **P**, may lie in one straight line; then, since **B** *p* : **A** *p* :: **B** **P** : **A** **C**, whatever be the situation of the pentagraph, the angles **PCP** and *pCp*, are vertical, and, therefore, **PCp** will in every position of the instrument be a right line: but **PC** : *pC* :: **BA** : *Ap*, in each of the two positions in the figure, and consequently the triangles **PCP**, *pCp*, are similar; and **PP** : *pp* (:: **PC** : *pC*) :: **BA** : *Ap*, or in a given ratio. Hence it appears, that by moving the pencil *p*, *Ap* may be equal to **BA**, or less in any proportion; and consequently *pp* may be equal to **PP**, or less, in the same proportion.

PENTAGYNIA, in botany, the name of one of the orders in the fifth, tenth, eleventh, twelfth, and thirteenth classes in the Linnæan system; containing those plants which have five pistils in a hermaphrodite flower.

PENTAMETER. (from *πενταμετρος*, *q*; d. five measures.) In poetry, a kind of verse, consisting of five feet or metres.

The two first feet of a pentameter may be either dactyls or spondees; the third must be always a spondee; and the two last anapaests.

It is usually joined to hexameters, in elegies, epistles, epigrams, and other little pieces. There is no work extant of pentameters alone.

PENTANDRIA, in botany, the name of the fifth class in Linnæus's system; comprehending those plants which have hermaphrodite flowers with five stamens.

PENTANGULAR. *a.* (πεντε and angular.) Five cornered (*Grew*).

PENTAPETALOUS. *a.* (πεντε and *πτελον*.) Having five petals or leaves.

PENTAPETES. In botany, a genus of the class monadelphia, order dodecandria. Calyx double, the outer three-leaved, caducous; petals five; stamens twenty, five of them barren; style obsoletely five-toothed; capsules five-celled, many-seeded; with the partitions contrary. One species, *P. Phoenicea*, scarlet-flowered pentapetes, an East-Indian annual, which dies in the autumn, soon after it has ripened its seeds.

PENTAPHYLLOUS CALYX, in botany, a five-leaved calyx, or rather perianth: as in *Cistus*, *Adonis*, *Cerbera*.

PENTAPHYLLUM. (*pentaphyllum*, *πενταφυλλον*, from *πεντε*, five, and *φυλλον*, a leaf; so named because it has five leaves on each stalk.) Common cinquefoil, or five-leaved grass. The roots of this plant, *potentilla reptans*; *foliis quinatis*, *caule repente*, *pedunculis unifloris* of Linnæus. *C. O.* *Icosandria*, *polygynia*; have a bitterish styptic taste. They were used by the ancients in the cure of intermittents; but the medicinal quality of cinquefoil is confined, in the present day, to stop diarrhoeas and other fluxes. See **POTENTILLA**.

PENTAPOLIS, a part of Africa, near Cy-

rene. It received this name on account of the five cities which it contained; Cyrene, Arsinoe, Berenice, Ptolemais or Barce, and Apollonia.

PENTASPACT. *s.* (πεντα and σπασω.) An engine with five pallies.

PENTASTIC. *s.* (πεντα and στιχος.) A composition consisting of five verses.

PENTASTYLE. *s.* (πεντα and στυλος.) In architecture, a work in which are five rows of columns.

PENTATEUCH. This word, which is derived from the Greek πεντατευχος, from πεντε, five, and τευχος, an instrument or volume, signifies the collection of the five instruments or books of Moses, which are Genesis, Exodus, Leviticus, Numbers, and Deuteronomy; each of which books we have given an account of under their several names.

The Jews read the whole Pentateuch every year; and for this purpose they divide it into paragraphs or sections, which they distinguish into great and small. The great are those which they read in a week, of which there are fifty-four (see PARASCHE); and the small regard particular matters. Each greater section, which is denominated by the word with which it begins, is divided into seven parts, because they are read by so many different persons: the priest begins, afterwards a Levite; and in the choice of the other readers respect is paid to the rank of the people. After the text of Moses, they read a paragraph of the paraphrase of Onkelos. The books of the prophets are also divided in the same manner.

PENTATHLON, πενταθλον, in antiquity, the five exercises performed at the Grecian games, and for which prizes were proposed.

These exercises were wrestling, darting, leaping, running, and quoit-playing. He who bore away the prize in them all was called pentathlus; by the Latins, quinquertio; as the five exercises themselves were by those latter people called quinquertium.

PENTATONON, in the ancient music, a concord, by us called the redundant sixth.

It consists of four tones, and a major and minor semitone; whence the name, pentatonon, q. d. five tones.

PENTECONTARCHA, among the ancients, the captain or commander of a galley, called penteconteros.

PENTECONTEROS, πεντηκοντερος, a vessel with fifty oars.

PENTECOST, πεντηκοστη, Whitsuntide; a solemn feast of the church, held in commemoration of the descent of the Holy Ghost on the apostles; as described in the Acts. See WHITSUNTIDE.

It has its name from the Greek πεντηκοστη, q. d. quinquagesimus, fiftieth, because held on the fiftieth day after Easter.

In the ancient church Pentecost finished the paschal time, or Easter season; wherein, as Tertullian, St. Jerom, &c. observe, Hallelujah was sung every where, the office celebrated standing, no fasting allowed, &c.

The Jews likewise had a feast they called

Pentecost, or Quinquagesimus, solemnized in memory of the Laws being given to Moses, fifty days after their departure out of Egypt.

This was the second of the three grand festivals in the ecclesiastical year, at which all the males were to appear before the Lord at the national altar. It is called by several names in the Old Testament; as the Feast of Weeks, because it was celebrated seven weeks, or a week of weeks, after the Passover, or rather, after the first day of the feast of unleavened bread; the Feast of Harvest, according to Mede and Bochart, because, as the harvest begun at the Passover, it ended at Pentecost; or, according to others, because at this feast the first fruits of their wheat harvest were brought and offered to God; and the Feast of First Fruits.

PENTECOSTALS, *Pentecostalia*, anciently, were pious oblations made at the feast of Pentecost, by the parishioners to their parish-priest; and sometimes by inferior churches or parishes, to the principal or mother-church.

PENTHESILEA, a queen of the Amazons, daughter of Mars. She came to assist Priam in the Trojan war, and fought against Achilles, by whom she was slain. The hero was so struck with the beauty of Pentheseilea when he stripped her of her arms, that he even shed tears for her fate. Thersites laughed at the partiality of the hero, for which ridicule he was instantly killed. The death of Thersites so offended Diomedes, that he dragged the body of Pentheseilea out of the camp, and threw it into the Scamander. It is generally supposed, that Achilles was enamoured of the Amazon before he fought with her, and that she had by him a son called Cayster.

PENTHEUS, son of Echion and Agave, king of Thebes in Boeotia, forbad his subjects to pay adoration to Bacchus. He even ordered the god himself, who conducted the Theban women in the celebration of the orgies, to be seized and imprisoned. The god however escaped, and Pentheus then commanded all the bacchanals to be destroyed. And when the Theban women had gone out of the city to celebrate the orgies of Bacchus, Pentheus, apprized of the debauchery which attended the solemnity, ordered the god himself, who conducted the religious multitude, to be seized. His orders were obeyed with reluctance; but when the doors of the prison in which Bacchus had been confined, opened of their own accord, Pentheus became more irritated, and commanded his soldiers to destroy the whole band of the bacchanals. Bacchus then inspired the monarch with an ardent desire of seeing the orgies. Accordingly he hid himself in a wood for the purpose on mount Cithæron. But his curiosity proved fatal; the bacchanals all rushed upon him. His mother was the first who attacked him, and next her two sisters, Ino and Autonoe, and his body was torn to pieces.

PENTHORUM, in botany, a genus of the class decandria, order decangynia, Calyx

five or ten-cleft; petals from none to five; capsule five-beaked, five-celled. One species: an herbaceous plant of Virginia.

PENTHOUSE. *s.* (*pent*, from *penté*, Fr. and *house*.) A shed hanging out aslope from the main wall (*Knolles*).

PENTICE. *s.* (*pendice*, Italian.) A sloping roof (*Wotton*).

PENTILE. *s.* (*pent* and *tile*.) A tile formed to cover the sloping part of the roof (*Moxon*).

PENT up. *part. a.* (*pent*, from *pen*, and *up*.) Shut up (*Shakspeare*).

PENTLAND FRITH, a strait which divides the Orkney Islands from Caithnessshire, in Scotland. It is 20 miles long and 10 broad, and very dangerous to those who are not well acquainted with its tides and currents; especially in passing the Pentland Skerries, a cluster of rocks at the E. entrance of the frith.

PENTLAND HILLS, a ridge of mountains, in Edinburghshire, extending about ten miles from S.W. to N.E.

PENULTIMA, or **PENULTIMATE SYLLABLE**, in grammar, denotes the last syllable but one of a word; and hence the antepenultimate syllable is the last but two, or that immediately before the penultima.

PENUMBRA, in astronomy, a partial shade observed between the perfect shadow and the full light in an eclipse. It arises from the magnitude of the sun's body; for, were he only a luminous point, the shadow would be all perfect; but, by reason of the diameter of the sun, it happens that a place which is not illuminated by the whole body of the sun does yet receive rays from a part thereof.

PENURIOUS. *a.* (from *penuria*, Latin.) 1. Niggardly; sparing; not liberal; sordidly mean (*Prior*). 2. Scanty; not plentiful (*Addison*).

PENURIOUSLY. *ad.* (from *penurious*.) Sparingly; not plentifully.

PENURIOUSNESS. *s.* (from *penurious*.) 1. Niggardliness; parsimony (*Addison*). 2. Scantiness; not plenty.

PENURY. *s.* (*penuria*, Lat.) Poverty; indigence (*Hooker*).

PENTRIA, in botany, a genus of the class syngenesia, order polygamia æqualis. Receptacle naked; seeds crowned with a jagged membranaceous margin; calyx imbricate, hæmisphærical. One species, a Cape plant, by some regarded as a tanacetum, with silky downy branches; leaves crowded, wedge-form, unequally crenate at the tip; umbel terminal.

PE'ONY, in botany. See **PÆONIA**.

PEOPLE. *s.* (*peuple*, Fr. *populus*, Latin.) 1. A nation; those who compose a community (*Shakspeare*). 2. The vulgar (*Waller*). 3. The commonalty; not the princes or nobles (*Addison*). 4. Persons of a particular class (*Bacon*). 5. Men, or persons in general (*Arbutnot*).

To PE'OPLE. *v. a.* (*peupler*, Fr.) To stock with inhabitants (*Prior*).

PEPIN DE HERISTAL, or **LE GROS**,

mayor of the palace under Clovis III. Childerbert, and Dagobert. The power of these mayors in France was so great, that they left the sovereign only the empty title, and in the end seized on the throne itself.

PEPIN LE BRIEF, or **LE PETIT**, grandson to Pepin le Gros, and first king of the second race of French monarchs, was mayor of the palace to Childeric III. a weak prince. He contrived to confine him and his son Thierri in different monasteries; and then, with the assistance of pope Stephen III. he usurped the sovereign power. He died in 768, aged 54.

PEPLIS. Water-purslane. In botany, a genus of the class hexandria, order monogynia. Calyx campanulate, with a twelve-cleft mouth; petals six, inserted into the calyx; capsule superior, two-celled. Two species, creeping plants, one common to our own marshes, one a native of India.

PEPLUS, a long robe worn by the women in ancient times, reaching down to the feet, without sleeves, and so very fine that the shape of the body might be seen through it. The Athenians used much ceremony in making the peplus, and dressing the statue of Minerva with it. Homer makes frequent mention of the peplus of that goddess.

PEPPER. In botany. See **PIPER**.

PEPPER (Bell). In botany. See **CAPSICUM**.

PEPPER (Bird). In botany. See **CAPSICUM**.

PEPPER (Grape). In botany. See **VITIS**.

PEPPER (Guinea). In botany. See **CAPSICUM**.

PEPPER (Jamaica). In botany. See **MYRTUS**.

PEPPER MINT. In botany. See **MENTHA**.

PEPPER WALL. In botany. See **SEDUM**.

PEPPER WORT. In botany. See **LEPIDIUM**.

To PEPPER. *v. a.* (from the noun.) 1. To sprinkle with pepper. 2. To beat; to mangle with shot or blows (*Shakspeare*).

PEPPERBOX. *s.* (*pepper* and *box*.) A box for holding pepper (*Shakspeare*).

PEPPER CORN. *s.* 1. A corn of pepper. 2. Any thing of inconsiderable value.

PEPTICS. (*πεπτικά*, from *πεπα*, to ripen.) In medicine, digestive ointments and other materials.

PEPUSCH (John Christopher), a musician, born at Berlin, 1667. At the age of fourteen he was employed at the Prussian court as a teacher of music. In 1700, he came over to England, and was engaged at Drury-lane; and in 1713, he was admitted doctor of music at Oxford. About 1725, he married de l'Epine, an Italian singer of light character, but who had, by her engagements on the stage, amassed a fortune of 10,000 guineas. This woman, whose figure and complexion entitled her to the appellation of Hecate, by which her husband distinguished her, brought him one son, who died early. Pepusch died 1752, aged 85.

Pæonia Moutan.
Chinese Tree Pæony.

PEPYS (Samuel), an Englishman, secretary to the admiralty under Charles II. and his brother. He introduced regularity, and method in his department, and devoted himself to the collecting of memoirs of the navy, and other valuable documents, preserved at Magdalen college, Cambridge. To his judicious arrangements Britain is much indebted for her superiority in naval affairs, which she began to acquire after the civil wars. He died 1703.

PERACUTE. *a.* (*peracutus*, Latin.) Very sharp; very violent (*Harvey*).

PERADVENTURE. *ad.* (*par adventure*, French.) 1. Perhaps; may be; by chance (*Digby*). 2. Doubt; question: not properly (*South*).

To **PERA'GRATE**. *v. a.* (*peragro*, Latin.) To wander over; to ramble through.

PERAGRATION. *s.* (from *peragrate*.) The act of passing through any state or space (*Holder*).

To **PERA'MBULATE**. *v. a.* (*perambulo*, Lat.) 1. To walk through. 2. To survey, by passing through (*Davies*).

PERAMBULATION. *s.* (from *perambulare*.) 1. The act of passing through or wandering over (*Bac.*). 2. A travelling survey. 3. A district; limit of jurisdiction (*Holyday*).

PERAMBULATOR, an instrument for measuring distances, invented by bishop Wilkins. It is also sometimes called pedometer, waywiser, and surveying wheel.

This wheel is contrived to measure out a pole, or $16\frac{1}{2}$ feet, in making two revolutions; consequently its circumference is $8\frac{1}{4}$ feet, and its diameter 2-626 feet, or 2 feet $5\frac{1}{2}$ inches and $\frac{109}{1000}$ parts, very nearly. It is either driven forward by two handles, by a person walking; or is drawn by a coach wheel, &c. to which it is attached by a pole. It contains various movements, by wheels, or clock-work, with indices on its face, which is like that of a clock, to point out the distance passed over, in miles, furlongs, poles, yards, &c.

Its advantages are its readiness and expedition; being very useful for measuring roads, and great distances on level ground. See the fig. pl. 133, fig. 5.

An ingenious contrivance of this kind which deserves attention here, is the pedometer invented by Mr. Lowin Tugwell, of Beverstone, in the county of Gloucester, and which is represented in pl. 133, fig. 6, where A, is the stock of the pedometer; B, B, B, &c. twelve spokes; one end of which is fastened by means of a screw to the outward ring, or periphery of the wheel, while the other is inserted in the stock. C, the periphery, which is an iron ring sixteen and half feet, or one pole, in circumference; and which is divided into twenty-five equal parts, corresponding to the links of Gunter's chain for land-measuring, &c. D, D, D, &c. are twelve small plates, representing the separate spokes, and each of which includes two links of the chain above-mentioned; the twelfth spoke being divided at its foot, for comprehending the twenty-fifth link. E, an iron axis, being a screw with 320 circumlocutions, each of which is

marked separately on an engraved index on one of its sides; and, in order to apply this part of the machine, it is screwed firmly into the stock of the wheel, with which it revolves when in motion. F, a style, or alidade, being an expanding screw-nut, that embraces the axis, along which it screws, as the latter revolves with the wheel; and as each revolution describes an exact longitudinal pole (four of which are computed to a chain), the style being pendant, and moving towards its proper figure, denotes the length of ground passed; and it is divided into chains and poles on the index of the axis E, and into links on the periphery C. G, is a small adjusting screw; which being turned, the style may be removed to the beginning of the index, after the given line, in surveying or measuring land, has been ascertained in chains, poles, &c. H, represents a cross, or square, with sights for determining perpendiculars in land-measuring. It is suspended at its ends on the axis, whence it may be occasionally detached by a simple touch of the finger and thumb, when in use. Further, this cross prevents the style from being revolved with the axis by any accident. As the 320 divisions marked on the index of the axis E, describe a mile, the style F, after having passed over them, will stop; and, as it will now move round with the axis, it will carry with it the standard; which will strike on the wrist of the operator, and thus prevent him from proceeding to any further distance, till he withdraws his hand from between such standard and the axis. Having received this hint, he turns the screw G; puts the style F back to the bottom of the index; and continues the revolution of the machine, till he has completed his course.

Mr. Tugwell's contrivance is particularly calculated to prevent error in measuring land: as one person may thus survey with greater accuracy and expedition, than by the use of the chain alone. Besides, no fraud can possibly be committed by labourers, in measuring task-work; a circumstance of the utmost importance to agriculturists.

PERCA. *Perch*. In zoology, a genus of the class pisces, order thoracica. Jaws unequal; teeth sharp, incurved; gill-covers scaly, of three laminae, the upper serrate; gill-membrane seven-rayed; lateral line arched with the back; scales hard, rough; fins spinous; vent nearer the head than the tail. Sixty species, scattered through the seas of the globe, four or five of which are found in waters belonging to our own country. They are thus divided into sections.

A. Dorsal fins two, distinct.

B. Dorsal fin single; tail undivided.

C. Dorsal fin single; tail forked.

The following are chiefly worthy of notice:

1. *P. fluviatilis*. Common or river Perch.

Second dorsal fin with sixteen rays.

2. *P. labrax*. Basse. Second dorsal fin with fourteen rays; back dusky, tinged with blue; belly white.

Both these are British fishes, and possess a peculiar tenacity to life. The former grows to two

feet long; swims with great swiftness at a certain height in the water; easily takes a bait; feeds on aquatic insects and smaller fishes; spawns in May and June, and is very prolific; it has no real air-bladder, and from its integuments may be obtained a kind of glue.

The ancients were acquainted with this species; and among them it was deemed one of the first delicacies of the table.

*Nec te, delicias mensarum, perca, silebo
Ammigenos inter pisces dignande marinis.*

AUSONIUS.

Rondelet, and after him Gesner, blames the physicians in his time for ordering the river perch to their patients in febrile disorders, after a prescription of Galen, who meant the sea perch, a fish much lighter, as he alleges, and easier of digestion. Experience, however, has shewn that this distinction is made without a difference; both the sea and river kind being found equally palatable and salubrious. In the time of Willoughby this prejudice against the river perch had been forgotten: he approves of the taste of Ausonius, in deeming the flesh of this animal a great delicacy.

The river perch is easily caught with common earth worms, or small frogs, for a bait; and is so voracious, that the angler, who falls in with a shoal of them, will sometimes kill the whole. This species seldom grows to a large size, few being found above five or six pounds, and the greater number much below this weight. The body is deep and oval shaped; the scales rough; the back much arched; the side line nearer it than the belly. A minute description of a fish so common would be unnecessary.

The basse is distinguished by an uncommon degree of voracity, and hence was termed a wolf (*lupus*) by Ovid, a name frequently adopted by succeeding writers. In the salt water pools of Italy, it sometimes attains to a prodigious size, and weighs fifteen pounds; the flesh is extremely grateful to the taste: in the lakes these fishes are frequently found by the fishermen frozen to death, as they suppose, but more probably suffocated by the exclusion of the air from the surface of the water; a circumstance from which Willoughby takes occasion to caution those who keep them in ponds to break the ice frequently during the continuance of frost. This species inhabits indiscriminately lakes, rivers, and the sea; to the two former, however, they probably ascend from the sea, for they do not seem to breed in fresh water.

Upon the back there are two fins, both radiated with spines: behind the anus another arises and proceeds towards the tail, strengthened with fourteen rays; the three first spinous: the pectoral and ventral fins have each a mixture of prickly and cartilaginous rays. The scales are very thick set. The body is shaped like a salmon.

P. scandens. Climbing perch. Dorsal fin with seventeen spinous and eight soft rays; scales rough with a whitish denticulate edge. Inhabits rivers in Tranquebar, about a palm long;

has the very singular habit of crawling up trees, which it effects by means of the spines in the gill-covers, and spinous rays of the other fins. Body covered with a black slimy mucus, above dusky green, lighter on the sides, beneath pale-golden.

4. *P. cernua.* Ruffe. Dorsal fin twenty-seven rayed, spines fifteen; head thick, compressed; eyes large, pupil blue, irids brown with a yellow mark. Inhabits the clearstreams of our own country and of Europe generally; from six to eight inches long; body round, mucous, sides yellowish-dirty green, spotted with black, breast white, nape and back blackish; feeds on smaller fishes, and is the prey of larger and of various aquatic birds; is exceedingly fertile, and spawns in March or April: flesh good.

5 *P. migra.* Black fish. Body narrow, with small thin scales. Inhabits Cornwall; length fifteen inches. A very indistinct species.

6. *P. formosa.* Squirrel fish. Tail lunate; head marked with blue lines and blotches. Inhabits Carolina; gill-covers toothed; anterior part of the dorsal fin abbreviate towards the hind-part.

*PERCASE. *ad.* (*par* and *case*.) Perchance; perhaps: not used (*Bacon*).

PERCEANT. *a.* (*percant*, Fr.) Piercing; penetrating: obsolete (*Spenser*).

PERCEIVABLE. *a.* (from *perceive*.) Perceptible; such as falls under perception (*Locke*).

PERCEIVABLY. *ad.* (from *perceivable*.) In such manner as may be observed or known.

To PERCEIVE. *v. a.* (*percipio*, Lat.). 1. To discover by some sensible effects (*Shaks.*). 2. To know; to observe (*Locke*). 3. To be affected by (*Bacon*).

PERCEPTIBILITY. *s.* (from *perceptible*.) 1. The state of being an object of the senses or mind; the state of being perceptible. 2. Perception; the power of perceiving: not proper (*More*).

PERCEPTIBLE. *a.* (*perceptible*, French, *perceptus*, Latin.) Such as may be known or observed (*Bacon*).

PERCEPTIBLY. *ad.* (from *perceptible*.) In such a manner as may be perceived (*Pope*).

PERCEPTION. *s.* (*perceptio*, Lat.) 1. The power of perceiving; knowledge; consciousness (*Bentley*). 2. The act of perceiving; observation. 3. Notion; idea (*Hale*). 4. The state of being affected by something (*Bacon*).

A PERCEPTION is a word which cannot but be well understood, though it is difficult for the lexicographer to give any explanation of it. It has been called the first and most simple act of the mind by which it is conscious of its own ideas. This definition, however, is improper, as it confounds perception with consciousness; although the objects of the former faculty are things without us, those of the latter the energies of our own minds. Perception is that power or faculty by which, through the medium of the senses, we have the cognizance of objects distinct and apart from ourselves, and

learn that we are but a small part in the system of nature.

PERCEPTIVE. *a.* (*perceptus*, Lat.) Having the power of perceiving (*Glanville*).

PERCEPTIVITY. *s.* (from *perceptive*.) The power of perception or thinking (*Locke*).

PERCH, in ichthyology. See **PERCA**.

PERCH, in land measuring, a rod or pole of 16½ feet in length, of which 40 in length and 4 in breadth make an acre of ground. But, by the customs of several counties, there is a difference in this measure. In Staffordshire it is 24 feet; and in the forest of Sherwood 25 feet, the foot being there 18 inches long; and in Herefordshire a perch of ditching is 21 feet, the perch of walling 16½ feet, and a pole of densed ground is 12 feet, &c.

PERCH, the small horizontal bar in a cage, on which a bird sits.

PERCH OF A CARRIAGE, the bar which joins the axle-tree of the front wheels to that of the hind wheels.

To PERCH. *v. n.* (*percher*, French; from the noun.) To sit or roost as a bird (*Spenser*).

To PERCH. *v. a.* To place on a perch (*More*).

PERCHANCE. *ad.* (*per* and *chance*.) Perhaps; peradventure (*Wotton*).

PERCHERS. *s.* Paris candles used in England in ancient times; also the larger sort of wax candles, which were usually set upon the altar.

PERCHE, a late province of France, in Orleans, 35 miles long and 30 broad; bounded on the N. by Normandy, on the W. and S. by Maine, and on the E. by Beauce. It takes its name from a forest, and is pretty fertile. It now forms, with part of Normandy, the department of Orne.

PERCH FISHING. See **ANGLING** and **FISHING**.

PERCIPIENT. *a.* (*percipiens*, Latin.) Perceiving; having the power of perception.

PERCIPIENT. *s.* One that has the power of perceiving (*Glanville*).

PERCIVAL (Thomas), a physician, born and educated at Warrington, Lancashire. He studied at Edinburgh, and took his degrees at Leyden, 1765. He settled in 1767, at Manchester, where he continued to practise with increasing reputation till his death in 1804. He was a most amiable man, and to his zeal in the cause of philosophy Manchester is chiefly indebted for the establishment of its literary society, to whose memoirs he made many contributions. He published besides, *Moral and Literary Dissertations*; *Medical Ethics*, &c. besides a *Father's Instructions to his Children*, &c. In his principles Dr. Percival was a dissenter, but he was not so averse to the episcopalian religion, as to prevent one of his children from devoting himself to the ministry of the establishment.

PERCLOSE. *s.* (*per* and *close*.) Conclusion; last part: obsolete (*Haleigh*).

To PERCOLATE. *v. a.* (*percolo*, Latin.) To strain through (*Hale*).

PERCOLATION. *s.* (from *percolate*.)

The act of straining; purification or separation by straining (*Ray*).

To PERCUSS. *v. a.* (*percussus*, Latin.) To strike (*Bacon*).

PERCUSSION. *s.* (*percussio*, Latin.) 1. The act of striking; stroke (*Newton*). 2. Effect of sound in the ear (*Rymer*).

PERCUSSION, and **COLLISION**, are nearly synonymous, both being distinguishable from the pressure by the circumstance of velocity. A body operates upon another by pressure when it is at rest (at least, as to sense) and acts by its mere weight; and when a body which is moving acts upon another body which opposes its motion, it operates upon that body by percussion.

Percussion is either direct or oblique: and it is generally considered with regard to bodies that are perfectly or imperfectly elastic, or non elastic.

Direct percussion is that in which the impulse is made in the direction of a line perpendicular at the place of impact, and which also passes through the common centre of gravity of the two striking bodies. As is the case in two spheres, when the line of the direction of the stroke passes through the centres of both spheres; for then the same line, joining their centres, passes perpendicularly through the point of impact. And

Oblique percussion is that in which the impulse is made in the direction of a line that does not pass through the common centre of gravity of the striking bodies; whether that line of direction is perpendicular to the place of impact, or not.

The force of percussion is the same as the momentum, or quantity of motion, and is represented by the product arising from the mass or quantity of matter moved, multiplied by the velocity of its motion.

The nature and laws of percussion have been investigated by Aristotle, Galileo, Des Cartes, Huygens, and others. Aristotle started the idea that percussion and weight are incomparable; and most moderns have acquiesced in that opinion. Mr. Leibnitz paid much attention to this subject; but not with great success. Conformably to his whimsical doctrine of living and dead forces, the action of gravity, or of a spring, is a *vis viva*, when it actually produces motion in the body on which it acts; but when a stone lies on a table, and presses on it, this pressure is a *vis mortua*. Its exertion is made, and in the same instant destroyed, by an opposite *vis mortua*. Each of these exertions would have produced a beginning of motion (something different from any the smallest local motion); and the sum of all would, after a certain time, have amounted to a sensible motion and velocity. There seems no distinct conception to accompany, or that can accompany, this language. And, as a proof that Leibnitz had no distinct conceptions of the matter, he has recourse to an experiment of Galileo in support of his genesis of a sensible motion from the continual exertions of the *vis mortua*; and he concludes that the force of percussion is infinitely, or incomparably, greater than pressure, because it is the sum total of an infinity of individual exertions of *vis mortua*. Nothing but the authority which Leibnitz has acquired on the continent, by the zealous efforts of his partizans, could excuse our taking up any time in considering this unintelligible discourse. Surely, if there is such a thing as a *vis viva*, it exists in the moving water in Galileo's experiment, and its impulses are not continual exertions of a *vis mortua*. Nor is it possible to conceive continual impulse, or a

PERCUSSION.

beginning of motion that is not motion, &c. &c. It is paradoxical (and Leibnitz loved to raise the wonder of his followers by paradoxes) to say that percussion is infinitely greater than pressure, when we see that pressure can do every thing that can be done by percussion. Nay, Euler, by far the most able supporter of the doctrines of Leibnitz, about the force of bodies in motion, actually compares these two forces; and, in his Commentary on Robins's Artillery, demonstrates, in his way, that when a musket ball, moving with the velocity of 1700 feet per second, penetrates five inches into a block of elm, the force of its percussion is 107,760 times its weight. John Bernoulli restricts the infinite magnitude of percussion to the case of perfectly hard bodies; and, for this reason alone, says, that there can be none such in the universe. But, as this justly celebrated mathematician scouts with scorn the notion of attractions and repulsions, he must allow, that an ultimate atom of matter is unchangeable in its form; which we take to be synonymous with saying that it is perfectly hard. What must be the result of one atom in motion hitting another at rest? Here must be an instantaneous production of a finite velocity, and an infinite percussion. A doctrine which reduces its abettors to such subterfuges, and engages the mind in such puzzling contemplations, cannot (to say the best of it) be styled an explanation of the laws of nature. The whole language on the subject is full of paradoxes and obscurities. In order to reconcile this infinite magnitude of percussion with the observed finite magnitude of its effects, they say that the pressure, or instantaneous effort, has the same relation to the force of percussion that an element has to its integral; and in maintaining this assertion, they continually consider this integral under the express denomination of a sum total, robbing Leibnitz's great discovery of the infinitesimal calculus of every superiority that it possessed over Wallis's Arithmetic of Infinites, and really employing all the erroneous practices of the method of indivisibles. We look upon the strange things which have been inculcated, with pertinacious zeal, in this doctrine of percussion and *vires vices*, as the most remarkable example of the errors into which the unguarded use of Cavalieri's Indivisibles, and of the Leibnitzian notion of the infinitesimal calculus, have led eminent mathematicians. It is not true that the pressure, and the ultimate force of percussion, have this relation; nor has the pressure and the resulting motion, which is mistaken for the measure of this ultimate force, any mathematical relation whatever. The relation is purely physical; it is the relation of pure cause and effect; and all that we know of it is their constant conjunction. The relation of fluxion and fluent is not a mathematical or measurable relation, but a connection in thought; which is sufficient for making the one an indication of the other, and the measures of the proportions of the one a mean for obtaining a measure of the proportions of the other. In this point of view, the relation of pressure to motion, as the measure of the force of percussion, resembles that of fluxion and fluent, but is not the same.

Much has been said by the partizans of Mr. Leibnitz about the incomparableness of pressure and percussion, and many experimental proofs have been adduced of the incomparable superiority of the latter. Bulfinger says, that the pressure of many tons will not cause a spike to penetrate a block of hard oak half so far as it may be driven by a weak man with one blow of a mallet; and that a

moderate blow with a small hammer will shiver to powder a diamond, which would carry a mountain without being hurt by its pressure. Nay, even Mr. Camus, of the Academy of Paris, a staunch Cartesian, and an eminent mechanician, says that he beat a leaden bullet quite flat with a hammer of one pound weight, without much force; and that he found that 200 pounds weight would not have flattened it more than this blow: and he concludes from thence, that the force of the blow exceeded 200 pounds. These, to be sure, are remarkable facts, and justify a more minute consideration of a power of producing certain effects, which is so frequently and so usefully employed. But, at the same time, these are all such very vague expressions, and they do not authorise any precise conclusions from them. Mr. Camus saying "without much force," makes his pound weight, and his 200 pound weight, of no use for determining the force of the blow. He would have given more precise and applicable data for his decision, had he told us from what height the hammer should fall in order to flatten the bullet to this degree. But even then we should not have obtained any notion of the force in actual exertion during the flattening of the bullet; for the blow which could flatten the bullet in a longer or a shorter time, would unquestionably have been less or greater.

All the paradoxes, obscurities, and puzzling difficulties, in this subject, disappear, if we leave out of our consideration that unintelligible force, which is supposed to preserve a body in motion or at rest; and if we consider both of these states of body as conditions which will continue, unless some adequate cause operate a change; and if we farther grant, that such causes do really exist in the universe, however unknown their nature may be by us; and, lastly, if we acknowledge, that the phenomena of elasticity, expansiveness, cohesion, gravity, magnetism, electricity, are indications of the agency of such causes, and that their actual exertions, and the motions and changes consequent on these exertions, are so invariably connected with particular bodies, that they always accompany their appearance in certain mutual relations of distance and position:—if we proceed thus, all the phenomena of collision will be explained by these causes alone, without supposing the existence and agency of a cause distinct from them all, and incomparable with them, called the force of percussion.

For it has been sufficiently demonstrated, that that property of tangible coherent matter, which we call perfect elasticity, operates as a pressure during a certain small portion of time on both bodies, diminishing more and more the motion of the one, and augmenting that of the other, as the compression of one or both increases, till at last they separate with sensible velocities. In some very simple or perspicuous cases, we know what this pressure is in every instant of the action. We can tell how many pounds weight, at rest, will exert the same pressure. We can tell the whole duration of this pressure, and the space along which it is exerted; and, in such a case, we can say with precision what motion will be generated by this continued and varied pressure on the body which was at rest, and what diminution will be made in the motion of the other. All this can be done in the case of a ball A (fig. 7, pl. 133) moving like a pendulum with a small velocity, and striking a slender elastic hoop B, also suspended like a pendulum. We can ascertain by experiment before the collision, what pressure is neces-

P E R C U S S I O N .

nary for compressing it one inch, one-half, one-fourth, &c. Knowing this and the weight of the hoop, and the weight and velocity of the ball, we can tell every circumstance of the collision; how long the compression continues; what is the greatest compression; how far the bodies have moved while they were acting on each other; and what will be the final motion of each: in short, every thing that affords any mark or measure of a force of percussion. And we know that all this is produced by a force, familiarly known to us by the name of elasticity. Which of all these circumstances shall be called the percussion, or the force of percussion? Is it the ultimate or greatest pressure occasioned by the compression? This cannot be, because this alone will not be proportional to the final change of motion, which is generally taken as a measure of the percussion when a change of motion is its only observed effect.

We know that another perfectly elastic body, of the same weight, and struck by the same blow, and acquiring the same final velocity by the stroke, may not have sustained the tenth part of the pressure, in any one instant of the collision, if it has only been much more compressible. The greatest mutual pressure in the collision of a billiard ball is perhaps 1000 times greater than it is in a similar collision of a foot-ball of the same weight.

We also know what degree of compression will break this hoop, and what pressure will produce this compression. Therefore, should the fracture of the body be considered as the mark and measure of the percussion, we know what blow will just produce it, and be exhausted by so doing. In short, we know every mark and measure of percussion which this hoop can exhibit.

We can increase the strength of this hoop till it becomes a solid disk; and we see clearly, that in all these forms the mode of acting is the same. We see clearly, that it is the same when, instead of the solid disk, it is an elastic ball; therefore every thing that can indicate or measure the percussion of an elastic ball is explained without the operation of a peculiar force of percussion, even when the ball is shivered to pieces by the blow.

Nor is the case materially different when the bodies are soft, or imperfectly elastic. When the struck body is uniformly tenacious, it opposes a uniform resistance to penetration, and its motion will be uniformly accelerated by the action of its own tenacity during the whole time of mutual action, except a trifling variation occasioned by the mere motion of the internal parts, independent of their tenacity. If we know the weight necessary for merely penetrating this mass, and the weight and velocity of the penetrating body, we can tell how long it must be resisted by this force before its initial velocity will be annihilated, and therefore how far it will penetrate. We have tried this with deal, birch, willow, and other soft woods of uniform texture, and with nails having the body somewhat slenderer than the end, that there might not be an irregularity occasioned by a friction on the sides of the nail, continually increasing as the penetration advanced. We made the hammer fall from a considerable height, and hit the nail with great accuracy in the direction of its length, by fixing it to the end of a long lath, moveable round an axis. The results corresponded with the calculation with all the precision that could be desired.

But it does not result from all this agreement, that the force, exertion, or effect, of a blow with a hammer is equal to the pressure of any number

of pounds whatever. They are things that cannot be compared; and yet the force operating in the penetration by a blow is no way different from a pressure. It is a physical blunder to compare the area of the curve, whose abscissa is the depth of penetration, and the ordinates are as the resistances, with any pressure whatever. This area expresses the square of a velocity, and its slips, bounded by parallel ordinates indefinitely near each other, are as the decrements of this square of a velocity, occasioned by a pressure, acting almost uniformly along a very small space, or during a very small time. It is an absurdity therefore to sum up these slips as so many pressures, and to consider the sum total as capable of expressing any weight whatever. Such a paralogism is peculiar to Leibnitz's way of conceiving his infinitesimal method, and it could have no place in the genuine method of fluxions. It is this misconception that has made Mr. Leibnitz and his followers suppose that a body, accelerated by gravity, retains in it a sum total of all the pressures of gravity accumulated during its fall, and now forming a *vis viva*. Supposing that it requires a pressure of twenty pounds to press a six pound shot slowly through a mass of uniformly resisting clay; this pressure would carry it from the top to the bottom of a mountain of such clay. Yet this ball, if discharged horizontally from a cannon, would penetrate only a few yards, even though the clay should resist by tenacity only, independent of the motion lost by giving motion to its internal parts. In this experiment, the utmost pressure exerted during the motion of the ball did not much exceed the pressure of twenty pounds. In this comparison, therefore, percussion, so far from appearing infinitely greater than pressure, would appear much less. But there is perhaps no body that resists penetration with perfect uniformity, even though uniformly tenacious. When the ball has penetrated to some depth, the particles which are before it cannot be so easily displaced, even although they had no tenacity, because the particles adjoining are more hemmed in by those beyond them. We have always observed, that a ball impelled by gunpowder through water rises toward the surface (having entered horizontally through the side of the vessel at some depth), and this so much the more rapidly as it entered nearer to the surface. The reason is plain. The particles which must be displaced before the ball, escape more easily upwards than in any other direction. It is for this reason chiefly that a greater weight laid on the head of a nail will cause it to sink deeper into the wood; and thus a great weight appears to be commensurable with a great force of percussion. Also while a bullet is flattening more and more under a hammer during the progress of a blow, it is spreading under the hammer; more particles are resisting at once, and they find more difficulty in effecting their escape, being harder squeezed between the hammer and the anvil. The same increased resistance must obtain while it is flattening more and more under the quiet pressure of a weight; and thus, too, a greater weight appears to be commensurable with a greater blow.

After all, however, it is true, notwithstanding that a blow given by a falling body must excite a pressure greater than its mere weight can do, and this in any degree. Thus, suppose A B (fig. 8) to represent a spiral spring in its natural unconstrained dimensions, standing upright on a table. Let a b , be the abscissa of a line a d h k , whose ordinates e d , g h , i k , &c. are as the elastic reaction of the

spring when it is compressed into the lengths $c\delta$, $g\delta$, $i\delta$, &c. Suppose that, when it is compressed into the form CD , it will just support the weight of a ball lying on C . Then cd will be a reaction equal to the weight of the ball, and the rectangle $acdf$ will express the square of the velocity which this ball would acquire by falling freely through ac . If therefore the ball be gently laid on the top of the spring at A , and then let go, it will descend, compressing the spring. It will not stop when the spring has acquired the form CD , which enabled it to carry the weight of the ball gently laid on it. For in this situation it has acquired a velocity, of which the square is represented by the figure $adef$. It will compress the spring into the length $g\delta$, such that the area $cghd$ is equal to the area $adef$. If the ball instead of being gently laid on A , be dropped from M , it will compress the spring into such a length $i\delta$, that the area, ak is equal to the rectangle $mcdn$; and, if the spring cannot bear so great compression, it will be broken by this very moderate fall.

Thus we see that a blow may do things which a considerable pressure cannot accomplish. The accounts which are given of these remarkable effects of percussion, with the view of impressing notions of its great efficacy, are generally in very indefinite terms, and often without mentioning circumstances which are accessory to the effect. It would be very unfair to conclude an almost infinite power of percussion, from observing, that a particle of sand, dropped into a thick glass bottle which has not been annealed, will shiver it to pieces. When Mr. Bulfinger says that a moderate blow will break a diamond which would carry a mountain, he not only says a thing of which he cannot demonstrate the truth, and which, in all probability, is not true; but he omits noticing a circumstance which he was mechanician enough to know would have a considerable share in the effect. We mean the rapidity with which the excited pressure increases to its maximum in the case of a blow. In the experiment in question, this happens in less than the millionth part of a second, if the velocity of the hammer has been such as a man would generate in it by a very moderate exertion. For the blow which will drive a good lath nail to the head in a piece of soft deal with an ordinary carpenter's hammer, must be accounted moderate. This we have learned by experiment to be above 25 feet per second. The connecting forces exerted between the particles of the diamond may not have time sufficient for their excitation in the remote parts, so as to share the derangement among them all, in such a manner that it may be so moderate in each, as not to amount to a disunion in any part of the diamond. We see many instances of this in the abrupt handling of bodies of tender and friable texture. It is partly owing to this that a ball discharged from a pistol will go through a sheet of paper standing on edge without throwing it down, which it would certainly do if thrown at it by the hand. The connecting forces, having time to act in this last case, drag the other parts of the paper along with them, and their union is preserved. Also, when a great weight is laid on the diamond, it is gradually dimpled by it; and thus inclosing many parts together in the dimple, it obliges them to act in concert, and the derangement of each is thus diminished.

We flatter ourselves that the preceding observations and reflections will contribute somewhat towards removing the paradoxes and mysteries

which discredit, in some degree, our mechanical science. If we will not pertinaciously conjure up ideal phantoms, which, perhaps, cannot exist, but content ourselves with the study of that tangible matter which the Author of Nature has presented to our view, we shall have abundant employment, and shall perceive a beautiful harmony thro' the whole of natural operations; and we shall gradually discover more and more of those mutual adaptations which enable an atom of matter, although of the same precise nature wherever it is found, to act such an unspeakable variety of parts, according to the diversity of its situations and the scene on which it is placed. If a mind be "not captivated by the harmony of such sweet sounds," we may pronounce it "dark as Erebus, and not to be trusted." (*Sup. Ency. Britan.*)

It is a celebrated proposition of Bernoulli, that in the percussion or collision of perfectly elastic bodies the sum of the products formed by multiplying each body into the square of its velocity is not altered by the impact. And Mr. Atwood has shewn that if in any system of bodies, the elastic force be to that which causes the change of figure as 854 to 1000, the sum of the products formed by multiplying each body into the cube of its velocity, will be the same before and after the impact. See his Analysis of a Course of Lectures, page 45, where he gives the investigation generally for any power of the velocity.

Don George Juan, a celebrated Spanish author, has given a new physico-mathematical theory of percussion; for an account of which we must refer to Gregory's Mechanics, vol. i. p. 291, 313.

PERCUSSION (Centre of). See CENTRE.

PERCU'TIENT. *s.* (*percultiens*, Latin.) Striking; having the power to strike (*Bacon*).

PERDENDOSI, in music. An Italian compound signifying that the passage over which it is written is to be performed in a time gradually decreasing to the last note, and with a tone insensibly sinking on the ear till entirely lost.

PERDICUM, in botany, a genus of the class syngenesia, order polygamia superflua. Receptacle naked; down simple; florets two-lipped. Twelve species; a few of the Cape, the rest of South America.

PERDITION. *s.* (*perditio*, Latin.) 1. Destruction; ruin; death (*Bacon*). 2. Loss (*Shakspeare*). 3. Eternal death (*Raleigh*).

PERDIX. See TETRAO.

PERDUE. *ad.* Closely; in ambush (*Hud.*). PERDULOUS. *a.* (from *perdo*, Latin.) Lost; thrown away (*Bramhall*).

PERDURABLE. *a.* (*perdurable*, Fr.) Lasting; long continued: not in use (*Shaks.*).

PERDURABLY. *ad.* (from *perdurable*.) Lastingly (*Shakspeare*).

PERDURATION. *s.* (*perduro*, Latin.) Long continuance (*Ainsworth*).

PERECZAS, a town of Upper Hungary, capital of a county of the same name, 50 miles E. by N. of Tockay. Lon. 22. 26 E. Lat. 48. 30 N.

PEREGAL. *a.* (French.) Equal: obsolete (*Spenser*).

To PEREGRINATE. *v. n.* (*peregrinus*, Latin) To travel; to live in foreign countries.

PEREGRINATION. *s.* (from *peregrinus*,

Latin.) Travel; abode in foreign countries (*Bentley*).

PEREGRINE. *a.* (*peregrinus*, Latin.) Foreign; not native; not domestic (*Bacon*).

To PEREMPT. *v. a.* (*peremptus*, Latin.) To kill; to crush. A law term (*Ayliffe*).

PEREMPTION. *s.* (*peremptio*, Latin; *peremption*, French.) Crush; extinction. Law term.

PEREMPTORIALLY. *ad.* (from *peremptory*.) Absolutely; positively; so as to cut off all further debate (*Clarendon*).

PEREMPTORINESS. *s.* (from *peremptory*.) Positiveness; absolute decision; dogmatism (*Gov. of the Tongue*).

PEREMPTORY. *a.* (*peremptorius*, low Latin.) Dogmatical; absolute; such as destroys all further expostulation (*South*).

PERENNIAL. *a.* (*perennis*, Latin.) 1. Lasting through the year (*Cheyne*). 2. Perpetual; unceasing (*Harvey*).

PERENNITY. *s.* (from *perennitas*, Lat.) Equality of lasting through all seasons; perpetuity (*Derham*).

PERFECT. *a.* (*perfectus*, Latin; *parfait*, French.) 1. Complete; consummate; finished; neither defective nor redundant (*Hooker*). 2. Fully informed; fully skilful (*Shakspeare*). 3. Pure; blameless; clear; immaculate (*Sh.*). 4. Confident; certain (*Shakspeare*).

PERFECT FLOWER, in botany, having both stamen and pistil; or at least anther and stigma: the same therefore with hermaphrodite. Delin. Pl. In Philos. Botan. it is synonymous with petalodes of Tournefort. But the having a corol only is by no means sufficient to constitute perfection in a flower, according to Linnæus's idea: neither does the want of it argue imperfection.

PERFECT NUMBER, is one that is equal to the sum of all its aliquot parts when added together. Eucl. lib. 7, def. 22. As the number 6, which is $1 + 2 + 3$, the sum of all its aliquot parts; also 28, for $28 = 1 + 2 + 4 + 7 + 14$, the sum of all its aliquot parts. It is proved by Euclid, in the last prop. of book the 9th, that if the common geometrical series of numbers 1, 2, 4, 8, 16, 32, &c. be continued to such a number of terms, as that the sum of the said series of terms shall be a prime number, then the product of this sum by the last term of the series will be a perfect number. The first eight perfect numbers are as follow, with the factors and products which produce them:

The first perfect numbers.	Their values.
6	$= (2^2 - 1) 2$
28	$= (2^3 - 1) 2^2$
496	$= (2^5 - 1) 2^4$
8128	$= (2^7 - 1) 2^6$
33550336	$= (2^{13} - 1) 2^{12}$
8589869056	$= (2^{17} - 1) 2^{16}$
137438691328	$= (2^{19} - 1) 2^{18}$
2305843008139952128	$= (2^{31} - 1) 2^{30}$

See several considerable tracts on the subject of Perfect Numbers, in the Memoirs of the Petersburg Academy, vol. 2 of the new vols, and in several other volumes. See also

Barlow's Treatise on the Properties of Numbers.

To PERFECT. *v. a.* (*perfectus*, from *perficio*, Latin; *parfaire*, French.) 1. To finish; to complete; to consummate; to bring to its due state (*Waller*). 2. To make skilful; to instruct fully (*Shakspeare*).

PERFECTER. *s.* (from *perfect*.) One that makes perfect (*Pope*).

PERFECTION. *s.* (*perfectio*, Latin; *perfection*, French.) 1. The state of being perfect (*Milton*). 2. Something that concurs to produce supreme excellence (*Dryden*). 3. Attribute of God (*Atterbury*).

To PERFECTIONATE. *v. a.* (*perfectionner*, Fr.) To make perfect; to advance to perfection: not used (*Dryden*).

PERFECTIVE. *a.* (from *perfect*.) Conducing to bring to perfection (*Ray*).

PERFECTIVELY. *ad.* In such a manner as brings to perfection (*Grew*).

PERFECTLY. *ad.* (from *perfect*.) 1. In the highest degree of excellence. 2. Totally; completely (*Boyle*). 3. Exactly; accurately (*Locke*).

PERFECTNESS. *s.* (from *perfect*.) 1. Completeness; perfection. 2. Goodness; virtue (*Colossians*). 3. Skill (*Shakspeare*).

PERFIDIOUS. *a.* (*perfidus*, Latin; *perfid*, French.) 1. Treacherous; false to trust; guilty of violated faith (*Widow and Cat*). 2. Expressing treachery; proceeding from treachery (*Milton*).

PERFIDIOUSLY. *ad.* Treacherously; by breach of faith (*Hudibras*).

PERFIDIOUSNESS. *s.* (from *perfidious*.) The quality of being perfidious (*Tillotson*).

PERFIDY. *s.* (*perfidia*, Latin; *perfidie*, French.) Treachery; want of faith; breach of faith.

PERFLABLE. *a.* (from *perflo*, Latin.) Having the wind driven through.

To PERFLATE. *v. a.* (*perflo*, Latin.) To blow through (*Arbuthnot*).

PERFLATION. *s.* (from *perflate*.) The act of blowing through (*Woodward*).

PERFOLIATE LEAF. In botany, a perforated leaf. Si basis folii undique cingat transversim caulem. Philos. Bot. Basi transversim cingente (nec antice dehiscente) caulem. Having the base of the leaf entirely surrounding the stem transversely (without any opening in front). The latter clause of this explanation added in Delin. Pl. is not absolutely necessary to discriminate this from the stem-clasping leaf (amplexicaule); if the terms of the two explanations in Philos. Bot. be carefully attended to. The base of that is said to surround the sides of the stem; whereas in this, the base encircles it quite round; so that it seems as if the stem had been driven through the middle of the leaf. The perfoliate leaf is well exemplified in *bupleurum rotundifolium*.

After all, *folium perfoliatum* is perhaps an improper term, and should rather be *caulis perfoliatus*, a perfoliate stem.

PERFOLIATA. (from *per* and *folium*, so

called because the leaves surround the stem, like those of the cabbage.) Round-leaved hare's ear, or theroow wax. This plant, *bupleurum rotundifolium* of Linnéus, was formerly celebrated for curing ruptures, mixed into a poultice with wine and oatmeal. See *BUPLEURUM*.

PERFORANS. See *FLEXOR PROFUNDUS PERFORANS*.

PERFORATE LEAF, in botany. Full of small holes, very apparent when held up to the light. As in *hypericum*.

If there be any difference of meaning in the three terms perforate, pertuse, punctate; the first may be rendered pierced, the second punched, and the third dotted. In Delin. Pl. they are set down as synonymous, and are explained to be, *adspersa punctis excavatis*: that is, having hollow dots scattered over the surface. In Philos. Bot. we find only the term *punctatum* explained in the same manner. There also (p. 211.) mention is made of leaves that are dotted underneath; as in *anagallis* and *plantago maritima*.

The term perforate is applied also to a stigma having a hole bored through it.

PERFORATUS, in anatomy. See *FLEXOR BREVIS DIGITORUM PEDIS*, and *FLEXOR SUBLIMIS PERFORATUS*.

To PERFORATE. *v. a.* (*perforo*, Lat.) To pierce with a tool; to bore (*Blackmore*).

PERFORATION. *s.* (from *perforate*.) 1. The act of piercing or boring (*More*). 2. Hole; place bored (*Ray*).

PERFORATOR. *s.* (from *perforate*.) The instrument of boring (*Sharp*).

PERFORCE. *ad.* (*per* and *force*.) By violence; violently (*Shakspeare*).

To PERFORM. *v. a.* (*performare*, Ital.) To execute; to do; to discharge; to achieve an undertaking; to accomplish (*Sidney*).

To PERFORM. *v. n.* To succeed in an attempt (*Watts*).

PERFORMABLE. *a.* (from *perform*.) Practicable; such as may be done (*Brown*).

PERFORMANCE. *s.* (from *perform*.) 1. Completion of something designed; execution of something promised (*South*). 2. Composition; work (*Dryden*). 3. Action; something done (*Shakspeare*).

PERFORMER. *s.* (from *perform*.) 1. One that performs any thing (*Shakspeare*). 2. It is generally applied to one that makes a public exhibition of his skill.

To PERFRICATE. *v. n.* (*perfrico*, Lat.) To rub over.

PERFUMATORY. *a.* (from *perfume*.) That does perfume.

PERFUME. *s.* (*parfume*, French.) 1. Strong odour of sweetness used to give scents to other things (*Bacon*). 2. Sweet odour; fragrance (*Pope*).

To PERFUME. *v. a.* (from the noun.) To scent; to impregnate with sweet scent (*Pope*).

PERFUMER. *s.* (from *perfume*.) One whose trade is to sell things made to gratify the scent.

PERFUNCTORILY. *ad.* (*perfunctorie*,

Latin.) Carelessly; negligently; in such a manner as to satisfy external form (*Clar.*).

PERFUNCTORY. *a.* (*perfunctorie*, Lat.) Slight; careless; negligent (*Woodward*).

To PERFUSE. *v. a.* (*perfusus*, Latin.) To tincture; to overspread (*Harvey*).

PERGA, a town of Turkey in Europe, in Albania, opposite the island of Corfu. Lon. 20. 19 E. Lat. 39. 40 N.

PERGAMAR, a town of Turkey in Europe, in Romania, with a bishop's see; 60 miles S.W. of Adrianople, and 65 N.W. of Gallipoli. Lon. 25. 55 E. Lat. 41. 10 N.

PERGAMO, an ancient town of Natolia, with a bishop's see, a palace, and a castle. It is not so considerable as formerly, but has nine mosques, and occupies an oblong circumference of three miles, at the foot of a mountain. Here parchment was invented. It is seated on the Germasti, 15 miles from its mouth, and 37 N. of Smyrna. Lon. 27. 27 E. Lat. 39. 5 N.

PERGAMUS, the citadel of the city of Troy. The word is often used for Troy. It was situated in the most elevated part of the town, on the shores of the river Scamander.

PERGAMUS, a town of Mysia, on the banks of the Caycus. It was the capital of a celebrated empire called the kingdom of Pergamus, founded by Philæterus, an eunuch, whom Lysimachus, after the battle of Ipsus, had entrusted with the treasures he had obtained in the war. Philæterus made himself master of the treasures, and of Pergamus, in which they were deposited, B. C. 283, and laid the foundation of an empire, over which he himself presided for 20 years. His successors were Eumenes, Attalus, Eumenes the second, Attalus Philadelphus, and Attalus Philomator, 138, who, B. C. 133, left the Roman people heirs to his kingdom, as he had no children. Parchment was first invented and made use of at Pergamus to transcribe books, as Ptolemy, king of Egypt, had forbidden the exportation of papyrus from his kingdom. From this circumstance parchment has been called *charta pergamena*. Galenus the physician, and Apollodorus the mythologist, were born there. Æsculapius was the chief deity of the country.

PERGULARIA, in botany, a genus of the class pentandria, order digynia. Corol twisted, salver-shaped; nectary surrounding the parts of fructification, with five arrow-shaped points. Five species; horning plants of India and the Cape.

PERGUNNAH, in the language of Hindustan, means the largest subdivision of a province, whereof the revenues are brought to one particular head cutchery, from whence the accounts and cash are transmitted to the general cutchery of the province.

PERHAPS. *ad.* (*per* and *hap.*) Peradventure; it may be (*Smith*).

PERIA, a town of Persia, in the province of Irac, 90 miles W. of Ispahan. Lon. 51. 25 E. Lat. 32. 20 N.

PERIAC, a town of France, in the depart-

ment of Aude, celebrated for its salt-works, six miles S.W. of Narbonne.

PERIANDER. (περιανδρ., a tyrant of Corinth, son of Cypselus. The first years of his government were popular. Having consulted the tyrant of Sicily respecting the manner in which he ought to govern, he received no other answer but whatever explanation he wished to place on the tyrant's having, in the presence of his messenger, plucked in a field all the ears of corn which seemed to tower above the rest. Periander understood the meaning of this answer. He immediately put to death the richest and most powerful citizens of Corinth. He was not only cruel to his subjects, but even his family were objects of his vengeance. He committed incest with his mother, and put to death his wife Melissa, upon false accusation. He also banished his son Lycophron to the island of Corcyra, because the youth pitied the miserable end of his mother. Periander died about 585 years before the Christian era, and by the meanness of his flatterers, he was reckoned one of the seven wise men of Greece.

PERIANTH. (περιανθ., about, and ανθος, a flower.) In botany, the calyx of a flower when contiguous to the other parts of fructification. Calyx fructificatione contiguus. In Regn. Veget. it is corollæ approximatum: but it frequently happens that a flower has a perianth without any corol. The perianth is often, but improperly, called the calyx exclusively; for this latter term has a more extensive signification. See CALYX.

Perianth of the fructification includes the stamens and germ.

Perianth of the flower contains the stamens without the germ.

Perianth of the fruit contains the germ without the stamens.

For the difference between perianth and bracte, see BRACTE.

PERIAPATAM, a town of the peninsula of Hindustan, 24 miles S.W. of Seringapatam, and 54 N.E. of Tellicherry. Lon. 76. 31 E. Lat. 12. 15 N.

PERIAPT. s. (περιαπτω.) Amulet; charm worn as preservative against diseases or mischief (*Shakspeare*).

PERIBLEPSIS. (περιβλεψις, from περιβλεπω, to stare about.) In medicine, that kind of wild look which is observed in delirious persons.

PERIBROSIS. (περιβρωσις.) An ulceration or erosion at the corners or uniting parts of the eyelids. This disorder most frequently affects the internal commissura of the eyelids. The species are, 1. Peribrosis, from the acrimony of the tears, as may be observed in the epiphora. 2. Peribrosis, from an ægylops, which sometimes extends to the commissura of the eyelids.

PERICARDITIS. (περικαρδιτις, from περικαρδιον, the pericardium.) Inflammation of the pericardium.

PERICARDIUM. (περικαρδιον, from περι, about, and καρδια, the heart.) The membranaceous bag that surrounds the heart. Its use is

to secrete and contain the vapour of the pericardium, which lubricates the heart, and thus preserves it from concreting with the pericardium.

PERICARPI. (περι, and καρπος, fruit or seed.) In botany, a seed-vessel or seed-case. Viscus gravidum seminibus, quæ matura dimittit. Vasculum semina producens dimittensque. Ovarium fœcundatum. Philos. Bot. 52, 56, 92. Germen defloratum seminiferum. Regn. Veg. A viscus big with seeds, or a vessel producing seeds, which it lets drop when they are ripe. Or it may be considered as the ovary or germ fecundated, or arrived to a state of maturity, after the flower is past; containing ripe seeds analogous to fruitful eggs.

The most remarkable pericarps are the capsule, silique, legume, follicle, drupe, berry, strobile.

PERICHÆTIUM. (περι, and χαιτη, juba.) In botany. Involucrum setosum, quod inter foliola basin cingit. A bristly involucre, surrounding the base, among the leaflets: in mosses.

PERICHONDRIUM. (περιχονδριον, from περι, about, and χονδριον, a cartilage.) The membrane that covers a cartilage.

PERICLES, an Athenian of a noble family, son of Xanthippus and Agariste. He, by attending the lectures of Damon, Zeno, and Anaxagoras, became a commander, a statesman, and an orator. He rendered himself popular by opposing Cimon, the favourite of the nobility, and to remove every obstacle which stood in the way of his ambition, he lessened the dignity of the court of the Areopagus. He also attacked Cimon, and caused him to be banished by the ostracism. Thucydides also, who had succeeded Cimon, shared the same fate, and Pericles remained for 15 years the absolute sovereign of the republic. Pericles did not enrich himself, but the prosperity of Athens was the object of his administration. He made war against the Lacedæmonians, and restored the temple of Delphi to the care of the Phocians. He obtained a victory over the Sicyonians near Nemæa, and waged a successful war against the inhabitants of Samos at the request of his favourite mistress Aspasia. (See ASPASTA.) The Peloponnesian war was fomented by his ambitious views (see PELOPONNESIACUM BELLUM), and when he had warmly represented the flourishing state of his country, the Athenians undertook a war against the most powerful republics of Greece, which was concluded by the destruction of their empire, and the demolition of their walls. The Athenians were at first successful, but an unfortunate expedition raised clamours against Pericles, and he was condemned to pay fifty talents, but he was again restored to all his honours, and if possible invested with more authority than before. The dreadful pestilence, however, which had diminished the number of his family, proved fatal to him, and about 420 years before Christ, in his 70th year, he fell a sacrifice to that terri-

ble malady, which robbed Athens of so many citizens. Pericles was for 40 years at the head of the administration, 25 years with others, and 15 alone. As he was expiring, and seemingly senseless, his friends that stood around his bed expatiated with warmth on the most glorious actions of his life, and the victories which he had won, when he suddenly interrupted their tears and conversation, by saying that in mentioning the exploits that he had achieved, and which were common to him with all generals, they had forgot to mention a circumstance which reflected far greater glory upon him as a minister, a general, and above all as a man. The Athenians were so pleased with his eloquence that they compared it to thunder and lightning, and as to another father of the gods, they gave him the surname of Olympian. However great and venerable his character may be, his vicious partiality for the celebrated courtesan Aspasia justly subjected him to the ridicule and the censure of his fellow citizens.

PERICLITATION. *s.* (from *periclitor*, Latin.) 1. The state of being in danger. 2. Trial; experiment.

PERICONIA, in botany, a genus of the class cryptogamia, order fungi. Fungus globular; seeds sessile, deciduous, every where clothing the head and stem: one species only, an exotic liver-wort-like fungus.

PERICRANIUM. (*περικρανιον*, from *περι*, and *κρανιον*, the cranium.) The membrane that is closely connected to the bones of the head.

PERICULOUS. *a.* (*periculosus*, Latin.) Dangerous; jeopardous; hazardous (*Brown*).

PERIERGY. *s.* (*περι* and *εργον*.) Needless caution in an operation; unnecessary diligence.

PERIGÆUM, or **PERIGEE**, is that point of the orbit of the sun or moon, which is the nearest to the earth. In which sense it stands opposed to Apogé, which is the most distant point from the earth.

PERIGEE, in the ancient astronomy, denotes a point in a planet's orbit, where the centre of its epicycle is at the least distance from the earth.

PERIGÉUX, an ancient town of France, capital of the department of Dordogne and late province of Perigord, with a bishop's see, the ruins of a temple of Venus, and an amphitheatre. It is seated on the river Isle, 50 miles S.W. of Limoges. Lon. O. 48 E. Lat. 45. 11 N.

PERIGORD, a late province of France, 83 miles long and 60 broad; bounded on the N. by Angoumois and Marche, on the E. by Quierci and Limosin, on the S. by Agenois and Bazadois, and on the W. by Bourdelois, Angoumois, and Santonge. It abounds in iron-mines, and the air is pure and healthy. It now forms the department of Dordogne.

PERIGORD STONE. In mineralogy. See **MAGNESIUM**.

PERIHELION, **PERIHELIUM**, that point in the orbit of a planet or comet which is

nearest to the sun. In which sense it stands opposed to Aphelion, or Aphelium, which is the highest or most distant point from the sun.

Instead of this term, the ancients used *perigeum*; because they placed the earth in the centre.

PERIL. *s.* (*peril*, Fr. *perikel*, Dutch.) 1. Danger; hazard; jeopardy (*Daniel*). 2. Denunciation; danger denounced (*Shakspeare*).

PERILLA. In botany, a genus of the class didynamia, order gymnospermia. Calyx with the upper division very short; stamens distant; styles two, united. One species; an annual of India.

PERILLUS, an ingenious artist at Athens, who made a brazen bull for Phalaris, tyrant of Agrigentum. This machine was fabricated to put criminals to death by burning them alive, and it was such that their cries were like the roaring of a bull. When Perillus gave it to Phalaris, the tyrant made the first experiment upon the donor.

PERILOUS. *a.* (*perileux*, Fr. from *peril*.) 1. Dangerous; hazardous; full of danger. 2. It is used by way of emphasis; or ludicrous exaggeration of any thing bad (*Hudibras*). 3. Smart; witty; parlous (*Shakspeare*).

PERILOUSLY. *ad.* Dangerously.

PERILOUSNESS. *s.* Dangerousness.

PERIMETER. *s.* (*μερι* and *μετρεω*.) The compass or sum of all the sides which bound any figure, whether rectilinear or mixed. In circular figures, the equivalent words are circumference and periphery; the latter is also applied to ellipses.

PERINÆUS TRANSVERSUS. In myology. See **TRANSVERSUS PERINCI**.

PERINÆUM. (from *περινω*, to flow round, because that part is generally moist.) The space between the anus and organs of generation.

PERIOD. *s.* (*periode*, Fr. *περιδογ*.) 1. A circuit. 2. Time in which any thing is performed, so as to begin again in the same manner (*Watts*). 3. A stated number of years; a round of time, at the end of which the things comprised within the calculation shall return to the state in which they were at the beginning (*Holder*). 4. The end or conclusion (*Addison*). 5. The state at which any thing terminates (*Suckling*). 6. Length of duration (*Bacon*). 7. A complete sentence from one full stop to another (*Ben Jonson*). 8. A course of transactions memorably terminated: as, the periods of an empire.

To PERIOD. *v. a.* (from the noun.) *To* put an end to. A bad word (*Shakspeare*).

PERIOD. In astronomy, the time in which a star or planet makes one revolution, or returns again to the same point in the heavens.

There is a wonderful harmony between the distances of the planets from the sun, and their periods round him; the great law of which is, that the squares of the periodic times are always proportional to the cubes of their mean distances from the sun.

The periods, both tropical and sidereal,

with the proportions of the mean distances from the several planets, are already given in our treatise on astronomy.

PERIOD, in chronology, a revolution of a certain number of years. Of these different nations and persons have adopted various. As, **PERIOD** (Calippic), a cycle of seventy-six years.

PERIOD (Dionysian). See **VICTORIAN PERIOD**.

PERIOD (Hipparchus's), is a series or cycle of 304 solar years, returning in a constant round, and restoring the new and full moons to the same day of the solar year; as Hipparchus thought.

This period arises by multiplying the Calippic period by 4. Hipparchus assumed the quantity of the solar year to be 365d. 5h. 55m. 12 sec. and hence he concluded, that in 304 years Calippus's period would err a whole day. He therefore multiplied the period by 4, and from the product cast away an entire day. But even this does not restore the new and full moons to the same day throughout the whole period: but they are sometimes anticipated 1 d. 8 h. 23 m. 29 sec. 20 thirds.

PERIOD (Julian), so called as being adapted to the Julian year, is a series of 7980 Julian years; arising from the multiplications of the cycles of the sun, moon, and indiction together, or the numbers 28, 19, 15; commencing on the first day of January in the 764th Julian year before the creation, and therefore is not yet completed. This comprehends all other cycles, periods, and epochs, with the times of all memorable actions and histories; and therefore it is not only the most general, but the most useful of all periods in chronology.

As every year of the Julian period has its particular solar, lunar, and indiction cycles, and no two years in it can have all these three cycles the same, every year of this period becomes accurately distinguished from another.

This period was invented by Joseph Scaliger, as containing all the other epochs, to facilitate the reduction of the years of one given epoch to those of another. It agrees with the Constantinopolitan period, used by the Greeks, except in this, that the cycles of the sun, moon, and indiction, are reckoned differently; and also in that the first year of the Constantinopolitan period differs from that of the Julian period.

PERIOD (Metonic). See **CYCLE OF THE MOON**.

PERIOD (Victorian), an interval of 532 Julian years; at the end of which, the new and full moons return again on the same day of the Julian year, according to the opinion of the inventor Victorinus, or Victorius, who lived in the time of pope Hilary.

Some ascribe this period to Dionysius Exiguus, and hence they call it the Dionysian period: others again call it the great paschal cycle, because it was invented for computing the time of Easter.

The Victorian period is produced by multiplying the solar cycle 28 by the lunar cycle 19, the product being 532. But neither does this restore the new and full moons to the same day

throughout its whole duration, by 1 d. 16 h. 58 m. 59 s. 40 thirds.

PERIODICAL. **PERIODIC**. *a.* (periodique, French; from *period*.) 1. Circular; making a circuit; making a revolution (*Watts*). 2. Happening by revolution at some stated time (*Bentley*). 3. Regular; performing some action at stated times (*Addison*). 4. Relating to periods or revolutions (*Brown*).

PERIODICALLY. *ad.* (from *periodical*.) At stated periods (*Broome*).

PERIOECI, in geography, such inhabitants of the earth as have the same latitudes, but opposite longitudes; or live under the same parallel and the same meridian, but in different semicircles of that meridian, or in opposite points of the parallel. These have the same common seasons throughout the year, and the same phenomena of the heavenly bodies; but when it is noon-day with the one it is midnight with the other, there being twelve hours between them in an east or west direction. These are found on the globe, by the hour-index, or by turning the globe half round, that is 180 degrees either way.

PERIOSTEUM. (*περιοστεον*, from *περι*, about, and *οστειον*, a bone.) The membrane which invests the external surface of all the bones except the crowns of the teeth. It is of a fibrous texture, and well supplied with arteries, veins, nerves, and absorbents. It is called pericranium on the cranium; periorbita on the orbits; perichondrium when it covers cartilage; and peridesmium when it covers ligaments. Its use appears to be, to distribute the vessels on the external surfaces of bones.

PERIPATETICS, *Περικηταισται*, a sect of philosophers, the followers of Aristotle, or the maintainers of the Peripatetic philosophy: called also Aristotelians.

Cicero tells us, that Plato left two excellent disciples, Xenocrates and Aristotle, who founded two sects, which only differed in name; the former taking the appellation of Academics, who were those that continued to hold their conferences in the Academy, as Plato had done before: the others, who followed Aristotle, were called Peripatetics; from *περιπατεω*, I walk; because they disputed walking in the Lyceum.

Ammonius fetches the name Peripatetic from Plato himself, who only taught walking; and adds, that the disciples of Aristotle, and those of Xenocrates, were equally called Peripatetics; the one Peripatetics of the academy, the other peripatetics of the lyceum: but that, at length, the former quitted the title Peripatetic, for that of Academic, on occasion of the place where they assembled: and the latter retained simply that of Peripatetic.

The greatest and best part of Aristotle's philosophy, he borrowed from his master Plato: Serranus affirms confidently, and says he is able to demonstrate it, that there is nothing exquisite in any part of Aristotle's philosophy, dialectics, ethics, politics, physics, or metaphysics, but is found in Plato. And of this opinion are many of the ancient authors, Clemens Alexandrinus, &c.

PERIPATETICS.

Gale endeavours to shew, that Aristotle borrowed a good deal of his philosophy, both physical, about the first matter, and metaphysical, about the first being, his affections, truth, unity, goodness, &c. from the sacred books; and adds, from Clearchus, one of his (Aristotle's) scholars, that he made use of a certain Jew, who assisted him in his undertaking.

Aristotle's philosophy preserved itself in *puris naturalibus* for a long time: in the earlier ages of Christianity, the Platonic philosophy was more generally preferred; but this did not prevent the doctrine of Aristotle from forcing its way into the Christian church. Towards the close of the fifth century, it rose into considerable credit: the Platonists, interpreting, in their schools, some of the writings of Aristotle, particularly his dialectics, and recommending them to young persons. This seems to have been the first step to that universal dominion, which Aristotle afterwards obtained among the learned, which was at the same time much promoted by the controversies which Origen had occasioned. This father was zealously attached to the Platonic system; and therefore, after his condemnation, many, to avoid the imputation of his errors, and to prevent their being counted among the number of his followers, openly adopted the philosophy of Aristotle. Nor was any philosophy more proper for furnishing those weapons of subtle distinctions and captious sophisms, which were used in the Nestorian, Arian, and Eutychian controversies. About the end of the sixth century, the Aristotelian philosophy, as well as science in general, was almost universally decried; and it was chiefly owing to Boethius, who explained and recommended it, that it obtained a higher degree of credit among the Latins than it had hitherto enjoyed. Towards the end of the seventh century, the Greeks abandoned Plato to the monks, and gave themselves up entirely to the direction of Aristotle; and in the next century, the Peripatetic philosophy was taught every where in their public schools, and propagated in all places with considerable success. John Damascenus very much contributed to its credit and influence, by composing a concise, plain, and comprehensive view of the doctrines of the Stagyrte, for the instruction of the more ignorant, and in a manner adapted to common capacities. Under the patronage of Photius, and the protection of Bardas, the study of philosophy for some time declined, but was revived again about the end of the ninth century. About the middle of the 11th century, a revolution in philosophy commenced in France; when several famous logicians, who followed Aristotle as their guide, took nevertheless the liberty of illustrating and modelling anew his philosophy, and extending it far beyond its ancient limits. In the 12th century, three methods of teaching philosophy were in use by different doctors: the first was the ancient and plain method, which confined its researches to the philosophical notions of Porphyry, and the dialectic system, commonly attributed to St. Augustine, and in which was laid down this

general rule, that philosophical inquiries were to be limited to a small number of subjects, lest, by their becoming too extensive, religion might suffer by a profane mixture of human subtilty with its divine wisdom. The second method was called the Aristotelian, because it consisted in explications of the works of that philosopher, several of whose books, being translated into Latin, were almost every where in the hands of the learned. The third was termed the free method, employed by such as were bold enough to search after truth, in the manner the most adapted to render their inquiries successful, without rejecting the succours of Aristotle and Plato. A reformed system of the Peripatetic philosophy was first introduced into the schools in the university of Paris, from whence it soon spread throughout Europe, and has subsisted in some universities even to this day, under the name school philosophy. The foundation thereof is Aristotle's doctrine, often misunderstood, but oftener misapplied: whence the retainers thereto may be denominated reformed Peripatetics. Out of these have sprung, at various times, several branches: the chief are, the THOMISTS, SCOTISTS, and NOMINALISTS. See those articles.

On several of the topics treated by Aristotle, he was extremely vague and unsatisfactory, while on some few he was remarkably clear and luminous. Thus in his discussions on politics he states, in few words, the only legitimate purpose of political establishments. "Every political society (says he) forms, it is plain, a sort of community or partnership, instituted for the benefit of the partners. Utility is the end and aim of every such institution; and the greatest and most extensive utility is the aim of that great association comprehending all the rest, and known by the name of the commonwealth." Having stated and explained the grand purposes of society, he considers the best systems of means for attaining those purposes, and traces the distinction of ranks which arises from the inequalities of individual talents, virtue, and fortune. Political institutions are best fitted for promoting human happiness, when they are most suitable to the opinions and sentiments of the people, and the circumstances of the times and country. No one political system will equally suit all situations, and scarcely any two. Government being an arrangement, the best government must be the best arrangement, and the best arrangement is that in which the materials to be arranged are the best fitted both to receive and to preserve. The materials of the statesman or legislator are the number and character of his people, and the extent and quality of his country. The excellence of a commonwealth, however, is not to be estimated by its populousness or extent, but by its fitness for performing its proper functions; the same energies and habits constitute the happiness both of individuals and of nations. Men make governments, not governments them; nor by any system of political arrangements can a happy commonwealth be constituted from

fools or cowards, profligates or knaves. The bricks must be first prepared before the edifice can be reared. The human character is a compound of good and evil; the former arises from the balance of the affections, under the control and guidance of reason, the latter results from passion operating without restraint. That government is the best which most powerfully stimulates the energies of the people to beneficial purposes, and restrains them from hurtful pursuits. That must be a system of freedom, in the first place tempered by order, and moderation in the second. Mixed governments, wisely formed and balanced, best correspond to the state of mankind. Democracy, though apparently most agreeable to the rights of man, is not the best adapted to his wants; the general will, unrestrained, is apt to run into excess; to be precipitate in deliberation, and tardy in execution. While simple democracy is inexpedient for the people themselves, simple aristocracy and simple monarchy are equally inexpedient. The peripatetic system, after having prevailed with great and extensive dominion for many centuries, began rapidly to decline towards the close of the 17th, when the disciples of Ramus attacked it. It had also a succession of most formidable enemies in Galileo, Bacon, Descartes, Gassendi, Barrow, Newton, &c.

PERIPHERY. *s.* (περι and φερω.) Circumference (*Harvey*).

TO PERIPHRASE. *v. a.* (*periphraser*, Fr.) To express one word by many; to express by circumlocution.

PERIPHRAISIS. *s.* (περιφρασις; *periphrase*, Fr.) Circumlocution; use of many words to express the sense of one (*Watts*).

PERIPHRASTICAL. *a.* (from *periphrasis*.) Circumlocutory; expressing the sense of one word in many.

PERIPOCA. Virginian silk. In botany, a genus of the class pentandria, order digynia. Corol twisted; nectary surrounding the parts of fructification, putting forth five threads. Thirteen species, chiefly Asiatic plants; a few of the Cape. The following are cultivated.

1. *P. Græca*. Common Virginian silk. Stem shrubby, clasping any support, more than forty feet high, covered with a dark bark, and sending out slender branches which twine round each other; leaves ovate-lanceolate, near four inches long, two broad in the middle, pedicelled, lucid green above, pale below; flowers terminal, in bunches, of a purple colour. A native of Syria, flowering in July and August, but rarely ripening its seeds in this country.

2. *P. secamone*. Green peripoca.

3. *P. Indica*. Indian peripoca.

4. *P. Africana*. African peripoca.

The first sort often succeeds by cuttings, and is the only one that will bear the open air of this country. They may all be obtained by sowing their seeds procured from abroad, in pots of light earth plunged into a hot-bed. All of them require props, to prevent their trailing on the ground and fastening about other plants.

PERIPNEUMONIA. (*peripneumonia*, περιπνευμονία, from *πνευ*, and *πνευμων*, the lung.) Peripneumony, or inflammation of the lungs. See **PNEUMONIA**.

PERIPNEUMONIA NOTHA. Bastard or spurious peripneumony. Practitioners, it would appear, do not all affix this name to the same disease; some affirming it is a rheumatic affection of the respiratory muscles, while others consider it as a mild peripneumony. It is characterised by difficulty of breathing, great oppression at the chest, with obscure pains, cough, and occasionally an expectoration.

PERISCHII, in geography, the inhabitants of either frigid zone, between the polar circles and the poles, where the sun, when in the summer signs, moves only round about them, without setting; and consequently their shadows in the same day turn to all the points of the horizon.

TO PERISH. *v. n.* (*perir*, Fr. *perco*, Latin.)

1. To die; to be destroyed; to be lost; to come to nothing (*Locke*). 2. To be in a perpetual state of decay (*Locke*). 3. To be lost eternally (*Moreton*).

TO PE'RISH. *v. a.* To destroy; to decay: not in use (*Collier*).

PERISHABLE. *a.* (from *perish*.) Liable to perish; subject to decay; of short duration.

PERISHABLENESS. *s.* Liableness to be destroyed; liableness to decay (*Locke*).

PERISTALTIC MOTION. (*peristalticus*, περισταλτικός, from *πριστύνω*, to contract.) The vermicular motion of the intestines, by which they contract and propel their contents. A similar motion takes place in the Fallopian tubes, after conception, by means of which the ovum is translated from the ovarium into the uterus.

PERISTERIUM. (*peristerium*, περιστέριον, from *περιστέρον*, a pigeon, so called because pigeons cover it.) The herb vervain. See **VERBENA**.

PERISTYLE, in ancient architecture, a building encompassed with a row of columns on the inside.

PERISYSTOLE. (*perisystole*, περισυστολή, from *πριστύνω*, to compress.) The intermission or time between the contraction and dilatation of the heart.

PERITONÆUM. (*peritonæum*, περιτοναίον, from *περιτείνω*, to extend round.) A strong simple membrane, by which all the viscera of the abdomen are surrounded. It has an exceedingly smooth, exhaling, and moist internal surface. Outwardly, it is every where surrounded by cellular substance, which, towards the kidneys, is very loose and very fat; but is very short at the lower tendon of the transverse muscles. It begins from the diaphragm, which it completely lines; and, at the last fleshy fibres of the ribs, and the external lumbar fibres, it completes the septum, in conjunction with the pleura, with which it is continuous through the various intervals of the diaphragm. Posteriorly it descends before the kidneys; anteriorly, behind the abdominal muscles; it dips into the pelvis; from the bones of the

pubis, passes over the bladder, and descends behind; and being again carried backwards at the entrance of the ureters in two lunar folds, it rejoins upon the intestinum rectum, that part of itself which invests the loins, and in this situation lies before the rectum. The cellular texture, which covers the peritonæum on the outside, is continued into sheaths in very many places; of which one receives the testicles on each side, another the iliac vessels of the pelvis, viz. the obturatoria, those of the penis, bladder, and aorta, and, ascending to the breast, accompany the œsophagus and vertebræ; by means of which, there is a communication between the whole body and the peritonæum, well known in dropsical people. It has various prolongations, for covering the viscera. The shorter productions of this membrane are called ligaments; and are formed by a continuous reduplication of the peritonæum, receding from its inner surface, inclosing cellular substance, and extending to some viscus, where its plates separate, and, having diverged, embrace the viscus; but the intermediate cellular substance always accompanies this membranaceous coat, and joins it with the true substance of the viscus. Of this short kind of production, three belong to the liver, one or two to the spleen, and others to the kidneys, and to the sides of the uterus and vagina. By this means, the tender substance of the viscera is defended from injury by any motion or concussion, and their whole mass is prevented from being misplaced by their own weight, and from injuring themselves, being securely connected with the firm sides of the peritonæum.

PERITONITIS. (*peritonitis*, *περιτονίτις*, from *περιτοναϊον*, the peritonæum.) An inflammation of the peritonæum. A genus of disease in the class pyrexia and order phlegmasia of Cullen, known by the presence of pyrexia, with pain in the abdomen, that is increased when in an erect position. When the inflammation attacks the peritoneum of the viscera, it takes the name of the viscus: thus, peritonitis hepatis, peritonitis intestinalis, peritonitis omentalis, or epiploitis, or omentalis, peritonitis mesenterii.

PERITROCHIIUM, in mechanics, a wheel or circle, concentric with a cylinder, and moveable together with it about its axis. See **AXIS** and **AXLE**.

PERJURE. *s.* (*perjurus*, Latin.) A perjured or forsworn person: not in use (*Shakspeare*).

To **PERJURE.** *v. a.* (*perjuro*, Latin.) To forswear; to taint with perjury (*Shaks.*).

PERJURER. *s.* (from *perjure*.) One that swears falsely (*Spenser*).

PERJURY. *s.* (*perjuriū*, Latin.) False oath. See **OATH**.

PERIWIG. *s.* (*perruque*, French.) Adscitious hair; hair not natural, worn by way of ornament or concealment of baldness (*Swift*).

To **PERIWIG.** *v. a.* (from the noun.) To dress in false hair (*Swift*).

PERIWINKLE, in botany. See **VINCA**.

PERIWINKLE, in helminthology. See **TURBO**.

PERIZONIUS (James), a learned writer, who lived in the beginning of the last century. The name of his family, originally of Teutorp in Westphalia, was Voorbrock; but he changed it for the more classical one of Perizonius. He published, in 1669, the learned treatise *De Ratione studii Theologici*, after having been professor of divinity and the oriental languages both at Ham and Deventer. He died in 1717.

PERIZZITES, the ancient inhabitants of Palestine, mingled with the Canaanites. There is also a great probability that they themselves were Canaanites; but having no fixed habitations, sometimes dispersed in one country and sometimes in another, they were for that reason called Perizzites, which signifies scattered or dispersed. Pherazoth stands for hamlets or villages. The Perizzites did not inhabit any certain portion of the land of Canaan; there were some of them on both sides the river Jordan, in the mountains, and in the plains. In several places of scripture the Canaanites and Perizzites are mentioned as the two chief people of the country.

To **PERK.** *v. n.* (from *perch*, *Skinner*.) To hold up the head with an affected briskness.

To **PERK.** *v. a.* To dress; to prank (*Shakspeare*).

PERK. *a.* Pert; brisk; airy: obsolete (*Spenser*).

PERLOUS. *a.* (from *perilous*.) Dangerous; full of hazard (*Spenser*).

PERLEBERG, a town of Brandenburg, capital of the mark of Pregnitz. It has considerable cloth manufactures, and stands on the Stepenitz, 42 miles W.N.W. of Ruppín. Lon. 12. 3 E. Lat. 53. 8 N.

PERM, a government of Russia, formerly a province of Kasan. It is divided into two provinces, Perm, and Catharinenburg, the capitals of which are of the same name.

PERM, a town of Russia, capital of a government and province of the same name. It is seated on the Kama, at the influx of the Zegochekha, 620 miles E. by N. of Moscow, and 810 E. by S. of Petersburg. Lon. 55. 10 E. Lat. 57. 55 N.

PERMAGY. *s.* A little Turkish boot.

PERMANENCE. **PERMANENCY.** *s.* (from *permanent*.) 1. Duration; consistency; continuance in the same state; lastingness (*Hale*). 2. Continuance in rest (*Bentley*).

PERMANENT. *a.* (*permanens*, Latin.) 1. Durable; not decaying; unchanged (*Hooker*). 2. Of long continuance (*Kettlewell*).

PERMANENT, in botany, a term applied to leaves that remain on the plant till the fruit is ripe or after the summer is over.—To stipules continuing after the leaves drop off; as in the class diadelphia, and the order polygynia of class icosandria.—To calyxes, abiding after the corol is withered; as in the class didynamia.

PERMANENTLY. *ad.* (from *permanent*.) Durably; lastingly (*Boyle*).

PER

PERMANSION. *s.* (from *permaneo*, Lat.) Continuance (*Brown*).

PERMEABLE. *a.* (from *permeo*, Latin.) Such as may be passed through (*Boyle*).

PERMEANT. *a.* (*permeans*, Latin.) Passing through (*Brown*).

To **PERMEATE.** *v. a.* (*permeo*, Latin.) To pass through (*Woodward*).

PERMEATION. *s.* (from *permeate*.) The act of passing through.

PERMISCIBLE. *a.* (from *permisceo*, Lat.) Such as may be mingled.

PERMISSIBLE. *a.* (*permissus*, Latin.) What may be permitted.

PERMISSION. *s.* (*permission*, Fr. *permisus*, Latin.) Allowance; grant of liberty (*Milton*).

PERMISSIVE. *a.* (from *permitto*, Latin.) 1. Granting liberty, not favour; not hindering, though not approving (*Milton*). 2. Granted; suffered without hindrance; not authorized or favoured (*Milton*).

PERMISSIVELY. *ad.* By bare allowance; without hindrance (*Bacon*).

PERMISTION. *s.* (*permistus*, Latin.) The act of mixing.

To **PERMIT.** *v. a.* (*permitto*, Latin.) 1. To allow without command (*Hooker*). 2. To suffer without authorizing or approving. 3. To allow; to suffer (*Locke*). 4. To give up; to resign (*Dryden*).

PERMIT. *s.* A written permission from an officer for transporting goods from place to place, shewing the duty on them to have been paid.

PERMITTANCE. *s.* (from *permit*.) Allowance; permission. A bad word (*Derham*).

PERMIXTION. *s.* (from *permistus*, Lat.) The act of mingling; the state of being mingled (*Brerewood*).

PERMUTATION. *s.* (*permutation*, Fr. *permutatio*, Latin.) Exchange of one for another (*Ray*).

PERMUTATION, in arithmetic. See **ALTERNATION**.

To **PERMUTE.** *v. a.* (*permuto*, Latin; *permuter*, Fr.) To exchange.

PERMUTER. *s.* (*permutant*, French.) An exchanger; he who permutes.

PERNAU, a fortified town of Russia, in Livonia, with a castle; seated near the mouth of a river of the same name, 95 miles N. of Riga. Lon. 24. 30 E. Lat. 58. 30 N.

PERNICIOUS. *a.* (*perniciosus*, Latin.) 1. Mischievous in the highest degree; destructive (*Shakspeare*). 2. (*pernix*, Latin.) Quick; not used (*Milton*).

PERNICIOUSLY. *ad.* Destructively; mischievously; ruinously (*Shakspeare*).

PERNICIOUSNESS. *s.* (from *pernicious*.) The quality of being pernicious.

PERNICITY. *s.* (from *pernix*.) Swift-ness; celerity (*Ray*).

PERNIO. (*pernio*.) A chilblain. A species of erythema of Cullen.

PEROLA, in botany. See **MOMORDICA**.

PER

PERONEUS ANTICUS, in anatomy. See **PERONEUS BREVIS**.

PERONEUS BREVIS. (*peroneus musculus*, *περοναιος*, from *perone*, the fibula.) This muscle, which is in a great measure covered by the last described muscle, is the *peroneus secundus* seu *anticus* of Douglas, and the *peroneus medius* seu *anticus* of Winslow. It arises by an acute, thin, and fleshy origin from the anterior and outer part of the fibula, its fibres continuing to adhere to the lower half of that bone. Its round tendon passes through the groove in the malleolus externus, along with that of the *peroneus longus*, after which it runs in a separate groove to be inserted into the upper and posterior part of the tubercle at the basis of the metatarsal bone, that supports the little toe. Its use is to assist the *peroneus longus*.

PERONEUS LONGUS. This muscle, which is the *peroneus primus* seu *posticus* of Douglas, and the *peroneus maximus* seu *posterior* of Winslow, is situated somewhat anteriorly along the outer side of the leg. It arises tendinous and fleshy from the external lateral part of the head of the tibia, and likewise from the upper anterior surface and outer side of the perone or fibula, its fibres continuing to adhere to the outer surface of the latter to within three or four inches of the malleolus externus. It terminates in a long round tendon, which runs obliquely behind the malleolus internus, where it passes through a cartilaginous groove in common with the *peroneus brevis*, being bound down by an annular ligament. When it has reached the os calcis, it quits the tendon of the *peroneus brevis*, and runs obliquely inwards along a groove in the os cuboides, under the muscles on the sole of the foot, to be inserted into the outside of the posterior extremity of the metatarsal bone that supports the great toe. Near the insertion of this muscle we find a small bursa mucosa. This muscle draws the foot outwards, and likewise assists in extending it.

PERONEUS MAXIMUS. See **PERONEUS LONGUS**.

PERONEUS MEDIUS. See **PERONEUS BREVIS**.

PERONEUS POSTICUS. See **PERONEUS LONGUS**.

PERONEUS PRIMUS. See **PERONEUS LONGUS**.

PERONEUS TERTIUS. This is the name given by Albinus to a muscle which, by some writers, is called *nonus Vesalii*, or *Vesalius's* ninth muscle of the foot; but by most considered in the present day as a portion of the *extensor longus digitorum pedis*. It is situated at the anterior, inferior, and outer part of the leg, along the outer edge of the last described muscle, to which it is intimately united. It arises fleshy from the anterior surface of the lower half of the fibula, and from the adjacent part of the interosseous ligament. Its fibres run obliquely downwards, towards a tendon which passes under the annular ligament, and then running obliquely outwards, is insert-

ed into the root of the metatarsal bone that supports the little toe.

This muscle assists in bending the foot.

PERONEUS SECUNDUS. See PERONEUS BREVIS.

PERONES, in antiquity, a kind of high-shoes worn by men of ordinary rank in Rome.

PERONNE, a strong town of France, in the department of Somme. It is called Pucelle, because it has never been taken, though often besieged. The castle was the imprisonment of Charles the simple, who here miserably died; and in this castle the duke of Burgundy detained Lewis XI. three days, till he consented to sign a disadvantageous treaty. It is seated on the Somme, 27 miles S.W. of Cambray, and 80 E. by N. of Paris. Lon. 3. 2 E. Lat. 49. 55 N.

PERORATION, *peroratio*, in rhetoric, the epilogue, or last part, of an oration; wherein whilst the orator had insisted on through his whole discourse is urged afresh, with greater vehemence and passion.

The peroration consists of two parts: 1. Recapitulation, wherein the substance of what was diffused throughout the whole speech is collected briefly and cursorily, and summed up with new force and weight.

2. The moving the passions; which is so peculiar to the peroration, that the masters of the art call this part *sedes affectuum*.

PEROTIS, in botany, a genus of the class triandria, order digynia. Calyxless; corol two-valved, the valves equal, awned, invested on the outside with very long wool. Three species, Indian grasses with flowers in thin spikes; florets pedicelled and purplish.

PEROUSE (John Francis Galoup de la), the celebrated, though unfortunate, French navigator, was born at Albi in 1741. Of the rank or condition of his father, M. Milet-Mureau has given us no information in that meagre eulogy of Perouse which he has inserted in the introduction to his last voyage. It appears, however, that he intended to make his son a seaman, and sent him, at a very early period of life, to the marine school, where the young man became enthusiastically fond of his profession, and laudably ambitious to emulate the fame of the most celebrated navigators.

Being appointed a midshipman on the 19th of November 1756, he behaved, we are told, with great bravery in that station, and was severely wounded in the engagement between the admirals Hawke and Conflans, on the 20th of November 1759. The Formidable, in which he served, was taken, after a vigorous resistance; and it is probable that Perouse reaped some advantage from his acquaintance with British officers.

On the 1st of October 1764 he was promoted to the rank of lieutenant; and despising a life of ease and idleness, he contrived to be employed in six different ships of war during the peace that subsisted between Great Britain and France. In 1767 he was promoted to the rank of what, in our navy, is called master and commander. In 1779 he commanded the

Amazone, belonging to the squadron of vice-admiral count d'Estaing; and when that officer engaged admiral Byron, the post of La Perouse was to carry his admiral's orders to the whole of the line. He afterwards took the sloop Ariel, and contributed to the capture of the Experiment—exploits which his eulogist seems to consider as instances of very uncommon heroism; but he soon after performed a greater.

Being, on the 4th of April, 1780, appointed captain of the frigate Astrea, and being on a cruise with the Hermione, these two frigates attacked six English vessels of war, of from 28 to 14 guns each, and took two of them. The French certainly reaped more laurels about that period than they have been accustomed to do in naval wars with Great Britain; but as we have completely forgotten the particulars of this fight, we suspect that it was not altogether so very brilliant a business as M. Milet-Mureau is pleased to represent it.

In the year 1782, La Perouse was dispatched with the Sceptre of 74 guns, and two frigates of 36 guns each, having some troops and field pieces on board, to destroy the English settlements in Hudson's Bay. This task was easily accomplished; for when he had surmounted the difficulties of navigation in a frozen sea, he found nothing on shore to oppose the smallest force. Having destroyed the settlements, he learned that some of the English had fled at his approach into the woods; and his eulogist considers it (such are the dispositions of French republicans) as a most wonderful instance of humanity, that he left to these unfortunate men provisions to preserve them from perishing by hunger, and arms to protect them from the fury of the savages! Perouse, we dare answer for him, was conscious of nothing heroic or extraordinary in this act of beneficence, which he certainly could not have omitted, without incurring both infamy and guilt.

In the year 1785, he was appointed to the command of a voyage round the world; which was unfortunately destined to be his last. Of this voyage, as far as it was accomplished, there is a full account in the hands of every French and English reader; and from that account it appears, that Perouse was admirably qualified to discharge such a trust. He seems to have been an experienced and skilful seaman; a man of considerable mathematical and physical science, uncorrupted by that philosophy which disgraced many of his attendants; and capable of the utmost perseverance in every laudable pursuit. To these qualities he united a proper combination of caution and courage, with a disposition truly benevolent to the various tribes of savages whom he visited. The disasters which occurred on the voyage were all, except the last, of which nothing is known, occasioned by the disobedience of his officers, or their neglecting to follow his advice.

The last dispatches of this great and good man were dated from Botany Bay, February the 7th, 1788; and since that period, no account of him has been received which is inti-

pled to the smallest confidence. Of course the place and time of his death are unknown.

To **PERPEND.** *v. a.* (*perpendo*, Lat.) To weigh in the mind; to consider attentively (*Shakspeare*).

PERPENDER. *s.* (*perpigne*, Fr.) A coping stone.

PERPENDICLE. *s.* (*perpendicular*, Fr. *perpendicularum*, Lat.) Any thing hanging down by a straight line.

PERPENDICULAR. *a.* (*perpendiculaire*, Fr. *perpendicularis*, Latin.) 1. Crossing any other line at right angles (*Newton*). 2. Cutting the horizon at right angles (*Brown*).

PERPENDICULAR, in geometry, a line standing upon another line, so as to make equal angles on each side, or a right angle on either side.

PERPENDICULAR OF A CONIC SECTION OR CURVE. See **CURVE** and **NORMAL**.

PERPENDICULAR, in gunnery, is a small instrument, used for finding the centre line of a piece in the operation of pointing it to a given object.

PERPENDICULARLY. *ad.* 1. In such a manner as to cut another line at right angles. 2. In the direction of a straight line up and down (*More*).

PERPENDICULARITY. *s.* (from *perpendicular*.) The state of being perpendicular (*Watts*).

PERPENSION. *s.* (from *perpend*.) Consideration: not in use (*Brown*).

To **PERPETRATE.** *v. a.* (*perpetro*, Lat.) To commit; to act. Always in an ill sense.

PERPETRATION. *s.* (from *perpetrate*.) 1. The act of committing a crime (*Wolton*). 2. A bad action (*King Charles*).

PERPETUAL. *a.* (*perpetuel*, Fr. *perpetuus*, Latin.) 1. Never ceasing; eternal with respect to futurity (*Dryden*). 2. Continual; uninterrupted; perennial (*Arbuthnot*). 3. Perpetual screw. A screw which acts against the teeth of a wheel, and continues its action without end (*Wilkins*).

PERPETUALLY. *ad.* (from *perpetual*.) Constantly; continually; incessantly (*Newton*).

To **PERPETUATE.** *v. a.* (*perpetuo*, Lat.) 1. To make perpetual; to preserve from extinction; to eternize (*Addison*). 2. To continue without cessation or intermission (*Hammond*).

PERPETUATION. *s.* (from *perpetuate*.) The act of making perpetual; incessant continuance (*Brown*).

PERPETUITY. *s.* (*perpetuitas*, Latin.) 1. Duration to all futurity (*Hooker*). 2. Exemption from intermission or cessation (*Holder*). 3. Something of which there is no end (*Pope*).

PERPETUITY, in the doctrine of annuities, is the number of years in which the simple interest of any principal sum will amount to the same as the principal itself; or it is the number of years' purchase to be given for an annuity which is to continue for ever; and it is found by dividing 100l. by the rate of interest agreed upon; thus allowing 5 per cent, the

perpetuity is $L. \frac{100}{5} = 20$; and at the rates usually adopted, the perpetuity is as follows:

$$\text{At 3 per cent. } \frac{100}{3} = 33.333, \&c.$$

$$3\frac{1}{2} \dots \dots \frac{100}{3.5} = 28.57, \&c.$$

$$4 \dots \dots \frac{100}{4} = 25.$$

$$4\frac{1}{2} \dots \dots \frac{100}{4.5} = 22.22, \&c.$$

$$5 \dots \dots \frac{100}{5} = 20.$$

$$6 \dots \dots \frac{100}{6} = 16.66, \&c.$$

$$7 \dots \dots \frac{100}{7} = 14.28, \&c.$$

$$8 \dots \dots \frac{100}{8} = 12.5.$$

These are the number of years purchase to be given for a perpetual annuity, on the supposition that it is receivable yearly.

PERPETUITY, in law, is where, if all that have interest join in the conveyance, yet they cannot bar or pass the estate; for, if by concurrence of all having interest, the estate may be barred, it is no perpetuity.

PERPIGNAN, a fortified town of France, capital of the department of Eastern Pyrenees, with a good citadel and a university. It was lately a bishop's see, and is seated on the Tet, near the Mediterranean, 95 miles S.E. of Toulouse. Lon. 2. 54 E. Lat. 42. 42 N.

To **PERPLE'X.** *v. a.* (*perplexus*, Latin.) 1. To disturb with doubtful notions; to entangle; to make anxious; to tease with suspense or ambiguity; to distract (*Dryden*). 2. To make intricate; to involve; to complicate (*Addison*). 3. To plague; to vex: not used (*Granville*).

PERPLE'X. *a.* (*perplex*, Fr. *perplexus*, Lat.) Intricate; difficult. *Perplexed* is the word in use (*Granville*).

PERPLE'XEDLY. *ad.* (from *perplexed*.) Intricately; with involution.

PERPLE'XEDNESS. *s.* (from *perplexed*.) 1. Embarrassment; anxiety. 2. Intricacy; involution; difficulty (*Locke*).

PERPLE'XITY. *s.* (*perplexité*, Fr.) 1. Anxiety; distraction of mind (*Spenser*). 2. Entanglement; intricacy (*Shillingfleet*).

PERPOTATION. *s.* (*per* and *poto*, Lat.) The act of drinking largely.

PERQUISITE. *s.* (*perquisitus*, Lat.) Something gained by a place or office over and above the settled wages (*Addison*).

PERQUISITED. *a.* (from *perquisite*.) Supplied with perquisites (*Savage*).

PERQUISITION. *s.* (*perquisitus*, Latin.) An accurate inquiry; a thorough search (*Ainsworth*).

PERRON (James Davy Du), a cardinal distinguished by his abilities and learning, was born in the canton of Bern in 1556. He was

educated by Julian Davy, his father, a very learned Calvinist, who taught him Latin and the mathematics; after which, he by himself became acquainted with the Greek and Hebrew, philosophy and the poets. Philip Desportes, abbot of Tyron, made him known to Henry III. king of France, who conceived a great esteem for him. Some time after, Du Perron abjured Calvinism, and afterwards embraced the ecclesiastical function; and having given great proofs of his wit and learning, he was chosen to pronounce the funeral oration of Mary queen of Scots. After the murder of Henry III. he retired to the house of cardinal de Bourbon, and took great pains in bringing back the protestants to the church of Rome. Among others, he gained over Henry Spondanus, afterwards bishop of Pamiers. He also chiefly contributed to engage Henry IV. to change his religion; and that prince sent him to negotiate his reconciliation to the holy see, in which he succeeded. Du Perron was consecrated bishop of Evreux while he resided at Rome. On his return to France, he wrote, preached, and disputed against the reformed; particularly against Du Plessis Mornay, with whom he had a public conference in the presence of the king at Fontainebleau. He was made cardinal in 1604 by pope Clement VIII. at the solicitation of Henry IV. who afterwards nominated him to the archbishopric of Sens. The king at length sent him to Rome with cardinal Joyeuse, in order to terminate the disputes which had arisen between Paul V. and the Venetians. It is said that this pope had such an high opinion of the address of the cardinal Du Perron, that he used to say, "Let us pray to God to inspire the cardinal Du Perron, for he will persuade us to do whatever he pleases." After the death of Henry IV. he retired into the country, where he put the last hand to his works; and, setting up a printing-house, corrected every sheet himself. He died at Paris in 1618. His works were collected after his death, and published at Paris in 3 vols. folio.

PERRONET (John Rodolphus), rose by his merit to the office of director general of bridges and roads in France. He was for his services rewarded with the order of St. Michael, and became inspector, and afterwards director of the school of engineers at Paris. The bridges of Neuilly, Nantes, Orleans, &c. were constructed under his direction, and the public roads of the kingdom were improved by his plans. He died 1794, aged 86. He published a very curious and valuable description of the bridges which he had erected, 2 vols. folio—memoirs on the method of constructing grand arches of stone from 200 to 500 feet, over vallies, 4to. &c.

PERROT (Nicholas), Sieur d'Abancourt, one of the first geniuses of his age, was born at Chalons in 1606. After studying philosophy about three years, he was sent to Paris to follow the law. At eighteen years of age he was admitted advocate of parliament, and frequent-

ed the bar; but he soon conceived a distaste for it, and therefore discontinued his practice. This displeased an uncle, but whose favour he recovered by quitting the protestant religion. He could not, however, be prevailed upon to take orders in the Romish church; and some years after, he had a desire to return to the religion he had abjured. But, that he might not do any thing rashly, he resolved to study philosophy and divinity. For that purpose he chose for his master Mr. Stuart, a Scotsman and Lutheran, a man of great learning. Almost three years he spent in the most assiduous study; and then set out from Paris to Champagne, where he abjured the Roman catholic, and once more embraced the protestant religion. In 1637 he was admitted a member of the French academy; a little after which, he undertook a translation of Tacitus. Whilst he was engaged in that laborious task, he retired to his small estate of Ablancourt, and lived there till his death in 1664. He was a man of fine understanding, of great piety and integrity, and of universal learning. Moreri has given a catalogue of his works, the greatest part of which consist of translations, which seemed rather originals.

PERRUKE, PERUKE, or PERTWIG, was anciently a name for a long head of natural hair; such, particularly, as there was care taken in the adjusting and trimming of. Menage derives the word very fancifully from the Latin *pilus*, hair. It is derived, according to this critic, thus: *pilus*, *pelus*, *pelutus*, *peluticus*, *pelutica*, *perutica*, *peruca*, *perruque*.

PERRY, a drink made from pears in the same manner that cyder is from apples. See CYDER.

PER SE, in the schools, is sometimes opposed to *per accidens*. In which sense, a thing is said to agree with another *per se*, when the agreement is not owing to any accidental event, but is found in the intrinsic principles of things themselves.

PER SE is sometimes also opposed to *per aliud*. In which sense, God alone is said to have a being *per se*, as not deriving it from any other, but having it necessarily, and of himself.

PER SE, again, sometimes signifies as much as, of its own nature, or in virtue of its own entity. Thus the sun is said to give light *per se*; and thus quantity is extended *per se*.

PER SE, among logicians. A thing is said to be known *per se*, *per se notum*, when we immediately perceive it upon the first proposing of the terms. As, that the whole is greater than its parts.

PERSEA, in botany. See LAURUS.

TO PERSECUTE. *v. a.* (*persecuter*, Fr. *persecutus*, Latin.) 1. To harass with penalties; to pursue with malignity (*Acts*). 2. To pursue with repeated acts of vengeance or enmity (*Dryden*). 3. To importune much.

PERSECUTION. *s.* (*persecution*, Fr. *persecutio*, Latin.) 1. The act or practice of persecuting (*Addison*). 2. The state of being persecuted (*Sprat*).

PERSECUTION, is any pain or affliction which a person designedly inflicts upon another; and in a more restrained sense the sufferings of Christians on account of their religion. Historians usually reckon ten general persecutions, the first of which was under the emperor Nero, 31 years after our Lord's ascension; when that emperor, having set fire to the city of Rome, threw the odium of that execrable action on the Christians, who under that pretence were wrapped up in the skins of wild beasts, and worried and devoured by dogs; others were crucified, and others burnt alive. The second was under Domitian, in the year 95. In this persecution St. John the apostle was sent to the isle of Patmos, in order to be employed in digging in the mines. The third began in the third year of Trajan, in the year 100, and was carried on with great violence for several years. The fourth was under Antoninus the philosopher, when the Christians were banished from their houses, forbidden to show their heads, reproached, beaten, hurried from place to place, plundered, imprisoned, and stoned. The fifth began in the year 197, under the emperor Severus. The sixth began with the reign of the emperor Maximinus in 235. The seventh, which was the most dreadful persecution that had ever been known in the church, began in the year 250, in the reign of the emperor Decius, when the Christians were in all places driven from their habitations, stripped of their estates, tormented with racks, &c. The eighth began in the year 257, in the fourth year of the reign of the emperor Valerian. The ninth was under the emperor Aurelian, A.D. 274; but this was very inconsiderable; and the tenth began in the 19th year of Dioclesian, A. D. 303. In this dreadful persecution, which lasted ten years, houses filled with Christians were set on fire, and whole droves were tied together with ropes and thrown into the sea. Hence, pillars were erected in Spain in honour of Dioclesian, for having "every where abolished the superstition of Christ;" and a medal of this emperor, still extant, was struck with the inscription, "*Nomine Christianorum deleto.*" See Milner's Church History, vol. ii. p. 6, 7; and Gregory's Letters on the Evidences, Doctrines, and Duties of the Christian Religion, vol. i. p. 245.

PERSECUTOR. *s.* (*persecuteur*, Fr. from *persecute*.) One who harasses others with continued malignity (*Milton*).

PERSEES, the descendants of a colony of ancient Persians, who took refuge at Bombay, Surat, and in the vicinity of those cities, when their own country was conquered 1100 years ago by the Mahometan Arabs. They are a gentle, quiet, and industrious people, loved by the Hindus, and living in great harmony among themselves. The consequence is, that they multiply exceedingly, whilst their countrymen in the province of Keman are visibly diminishing under the yoke of the Mahometan Persians. Of the manners and customs of this amiable race an interesting account is given in Niebuhr's Travels.

PERSEPHONE, a daughter of Jupiter and Ceres, called also Proserpine. (Vid. *PROSERPINA*.)—2. The mother of Amphion by Jasus.

PERSEPOLIS, a celebrated city, the capital of the Persian empire. It was laid in ruins by Alexander after the conquest of Darius. The reason of this is unknown. Some suppose that Alexander set it on fire at the instigation of Thais, one of his courtizans, when he had passed the day in riot and debauchery. The ruins of Persepolis still astonish the modern traveller by their grandeur and magnificence.

PERSEVERANCE. *s.* (*persevéance*, Fr. *perseverantia*, Lat.) 1. Persistence in any design or attempt; steadiness in pursuits; constancy in progress (*King Charles*). 2. Continuance in a state of grace (*Hammond*).

PERSEVERANT. *a.* (*perseverant*, Fr. *perseverans*, Lat.) Persisting; constant.

To PERSEVERE. *v. n.* (*persevero*, Lat. *perseverer*, French.) To persist in an attempt; not to give over; not to quit the design (*Wake*).

PERSEVERINGLY. *ad.* (from *persevere*.) With perseverance.

PERSEUS, in fabulous history, a son of Jupiter and Danae, the daughter of Acrisius. As Acrisius had confined his daughter in a brazen tower, to prevent her becoming a mother, because he was to perish, according to the words of an oracle, by the hands of his daughter's son; Perseus was no sooner born (vid. *DANAË*), than he was thrown into the sea with his mother Danae. The hopes of Acrisius were frustrated; the boat which carried Danae and her son was driven upon the island of Seriphos, one of the Cyclades, where they were found by a fisherman, and carried to Polydectes, the king of the place. They were treated with great humanity, and Perseus was entrusted to the care of the priests of Minerva's temple. His rising genius soon displeased Polydectes, who wished to offer violence to Danae, yet feared the resentment of her son. Polydectes, however, resolved to remove every obstacle. He invited his friends to an entertainment, who were to present the monarch with a beautiful horse. Perseus was also invited, as Polydectes knew that he could not receive from him the expected present. Perseus told the king, that as he could not give him a horse, he would bring him the head of the mortal gorgon Medusa. The offer was doubly agreeable to Polydectes, as the attempt might end in the ruin of Perseus. But the innocence of Perseus was patronized by the gods. Pluto lent him his helmet, Minerva her buckler, and Mercury his wings and talaria, with a short dagger called *herpe*. With these arms Perseus traversed the air, conducted by Minerva, and having discovered from the Graiæ, the sisters of the Gorgons, the place of their residence, he instantly flew to it. According to Hesiod and Apollodorus, it was beyond the western ocean. Having found them asleep, he approached them, and cut off Medusa's

head with one blow. The noise awoke the two sisters, but Pluto's helmet rendered Perseus invisible. The conqueror made his way through the air, and from the blood of Medusa's head sprang those innumerable serpents in the deserts of Libya. Chrysaor also, with his golden sword, sprang from the drops of blood, as well as the horse Pegasus. Mean time Perseus had crossed the deserts of Libya, but the approach of night obliged him to alight in the territories of Atlas, king of Mauritania, where the monarch not only refused Perseus the hospitality he demanded, but he even offered violence to his person. Perseus finding himself inferior to Atlas, showed him Medusa's head, and instantly he was changed into a large mountain which bore the same name, in Africa. Perseus continued his flight, and as he passed over Libya, he discovered on the coasts of Æthiopia the naked Andromeda, exposed to a sea monster. He was struck at the sight, and offered her father Cepheus to deliver her if he obtained her in marriage. Cepheus consented, and immediately Perseus flew towards the monster, then advancing to devour Andromeda, and he plunged his dagger in his right shoulder, and destroyed it. This happy event was attended with the greatest rejoicings, and the nuptials were celebrated with the greatest festivity. The universal joy, however, was soon disturbed. Phineus, Andromeda's uncle, attempted to carry away the bride; a bloody battle ensued, and Perseus again shewed the Gorgon's head to his adversaries, and they were instantly turned to stone, each in the posture and attitude in which he then stood. Perseus, after this adventure, retired to Seriphos, at the moment that his mother Danae fled to the altar of Minerva to avoid Polydectes, who attempted to offer her violence. Polydectes met the same fate as Atlas and Phineus, he was also turned into a stone by the power of Medusa's head. And Dictys, who had formerly saved the life of Perseus and Danae, was placed by Perseus on the throne of Seriphos. He then restored the armour he had received from the gods, having placed the Gorgon's head on the Ægis of Minerva. After these exploits, Perseus embarked for the Peloponnesus with his mother and Andromeda. When he reached the coast he was informed that Teutamias, king of Larissa, was then celebrating funeral games in honour of his father. This intelligence drew him to Larissa, to signalize himself in throwing the quoit, of which, according to some, he was the inventor. But here he was attended by an evil fate, and had the misfortune to kill a man with a quoit which he had thrown in the air. This was his grandfather Acrisius, and the oracle was fulfilled. This unfortunate murder greatly depressed the spirits of Perseus: by the death of Acrisius he was entitled to the throne of Argos, but he refused to reign there, and exchanged his kingdom for that of Tirynthus, and the maritime coast of Argolis, where Megapenthes the son of Proetus then reigned. Being settled in this part of the Peloponnesus,

he determined to found a new city, which he made the capital of his dominions, and which he called Mycenæ, because the pommel of his sword, called by the Greeks myces, had fallen there. The time of his death is unknown, yet it is universally agreed that he received divine honours like the rest of the ancient heroes. Perseus had by Andromeda, Alceus, Sthenelus, Nestor, Electryon, and Gorgophone, and after death, according to some mythologists, he became a constellation in the heavens.

PERSEUS, in astronomy, a constellation of the northern hemisphere, which, according to the catalogues of Ptolemy and Tycho, contains twenty-nine stars; but in the Britannic catalogue, sixty-seven.

PERSEUS, or PERSES, a son of Philip king of Macedonia, who distinguished himself, like his father, by his enmity to the Romans, and declared war against them. He wanted courage and resolution, and his avarice and his timidity proved destructive to his cause. When Paulus Æmilius was appointed to the command of the Roman armies in Macedonia, Perseus shewed his inferiority by his imprudent incampments, and at the famous battle at Pydna, B. C. 168, he was the first who fled as soon as the battle was begun, leaving the enemy masters of the field. From Pydna, Perseus fled to Samothrace; but he was soon discovered and brought to the Roman conqueror, where the meanness of his behaviour exposed him to ridicule. He was carried to Rome, and dragged along the streets of the city to adorn the triumph of the conqueror. His family were also exposed to the sight of the Roman populace, who shed tears on viewing, dragged like a slave, a monarch who had once spread alarm all over Italy, by the greatness of his military preparations. Perseus died in prison, or according to some he was put to a shameful death the first year of his captivity.

PERSHORE, a town in Worcestershire, with a market on Tuesday, and a manufacture of stockings. Here are two churches, and that of Holy Cross contains several ancient monuments. It is seated on the Avon, nine miles E.S.E. of Worcester, and 106 W.N.W. of London.

PERSIA, a celebrated kingdom of Asia, which in its ancient state extended from the Hellespont to the Indus, above 2800 miles, and from Pontus to the shores of Arabia above 2000 miles. As a province, according to Ptolemy, it was bounded on the north by Media, west by Susiana, south by the Persian gulf, and east by Carmania. The empire of Persia was first founded by Cyrus the Great, about 559 years before the Christian era, and under the succeeding monarchs it became one of the most powerful kingdoms of the earth. The destruction of the Persian monarchy by the Macedonians was easily effected, and from that time Persia became tributary to the Greeks. After the death of Alexander, Seleucus Nicanor made himself master of the Persian provinces, till the revolt of the Parthians introduced new

revolutions. Persia was partly reconquered from the Greeks, and remained tributary to the Parthians for near 500 years. Artaxerxes, a common soldier, A. D. 220, became the founder of the second Persian monarchy, which proved so inimical to the Roman emperors. In their national character, the Persians were warlike; they were early taught to ride, and to handle the bow, and by the manly exercises of hunting, they were inured to bear the toils and fatigues of a military life. Their national valour, however, soon degenerated, and their want of employment at home soon rendered them unfit for war. The celebrated action at Thermopylæ, and Marathon, and the succeeding actions at Salamis, Plataea and Mysale, shew in a strong light the superiority of the Grecian soldiers over the Persians. The Persians were anciently called Cephenees, Achæmenians, and Artæi. They received the name of Persians from Perses the son of Perseus and Andromeda, who is supposed to have settled among them. Persepolis was the capital of the country.

PERSIA (Modern), is bounded on the N. by Georgia, the Caspian sea, and Usbec Tartary, W. by Turkey and Arabia, S. by the gulfs of Persia and Ormus and the Arabian sea, and E. by Hindustan. It is 1220 miles from E. to W. and 900 from N. to S. In the N. and E. parts it is mountainous and cold; in the middle and S.E. parts, sandy and desert; in the S. and W. level and extremely fertile, though for several months very hot. The chief rivers are the Tigris and Kur; but there are many others, and several in the interior which are lost in sandy deserts. The soil produces all sorts of pulse and corn, except oats and rye. In several places, naphtha, a sort of bitumen, rises out of the ground; and there are mines of gold, silver, iron, turcois stones, and salt; but the first two of these are not worked, on account of the scarcity of wood. Among the products of Persia that are peculiarly excellent, are dates, pistachio-nuts, and poppies, that produce the finest opium. There are extensive plantations of mulberry-trees for silkworms; and large flocks of sheep and goats. The camels, horses, mules, asses, oxen, and buffaloes, are the best of their kind, and are indifferently used for carrying passengers or burdens, the horses excepted, which are only used for the saddle. The principal manufactures are silks, as satins, tabbies, taffetas, and silk mixed with cotton, or with camels or goats hair; brocades, gold tissues, and gold velvet, carpets, calicoes, camlets, &c. During almost the whole of this century, Persia has been desolated by competitors for the sovereignty. On the assassination of the usurper, Nadir Shah, in 1747, Ahmed Abdalla, one of his generals, founded the kingdom of Candahar, to which he annexed the provinces of Korasan and Segestan, in the E. part of Persia, and those provinces of Hindustan Proper, W. of the Indus, that had been ceded by the great mogul, in 1737, to Nadir Shah. Kerim Khan, another of Nadir's officers, obtained the sovereignty of all the southern provinces. He transferred the seat of

government from Ispahan to Schiras. He refused the title of Shah, or king, being satisfied with that of Protector of Persia. He was beloved by his subjects, and revered by foreign powers. On his death, in 1779, new competitors for the throne sprung up, and have almost ever since continued to spread slaughter and desolation over this unhappy country. The Persians are generally Mahometans, of the sect of Ali. Schiras is the capital.

PERSIA (Gulf of), a gulf between Persia and Arabia Felix. The entrance near Ormus is not above 30 miles over; but within it is 180 in breadth, and the length from Ormus to the mouth of the Euphrates is 420 miles.

PERSIAN LILY. See FRITILLARIA.

PERSIAN WHEEL, an engine, or wheel, turned by a rivulet, or other stream of water, and fitted with open boxes at its cogs, to raise water for the overflowing of lands, or other purposes. It may be made of any size, according to the height the water is to be raised to, and the strength of the stream by which it is turned. This wheel is placed so, that its bottom only is immersed in the stream, wherein the open boxes at its cogs are all filled one after another with water, which is raised with them to the upper part of the wheel's circuit, and then naturally empties itself into a trough which carries it to the land.

PERSIAN or PERSIC, in architecture, a name common to all statues of men, serving instead of columns to support entablatures.

PERSICA. (*персика*, from Persia, its native soil). The peach. The fruit of the amygdalus persica of Linnæus. It is known to be grateful and wholesome, seldom disagreeing with the stomach, unless this organ is not in a healthy state, or the fruit has been eaten to excess, when effects similar to those of the other dulco-acid summer fruits may be produced. The flowers, including the calyx, as well as the corol, are the parts of the persica used for medicinal purposes. These have an agreeable but weak smell, and a bitterish taste. Boulduc observes "that when distilled, without addition, by the heat of a water bath, they yield one-sixth their weight, or more, of a whitish liquid, which communicates to a considerable quantity of other liquids a flavour like that of the kernels of fruits." These flowers have a cathartic effect, and, especially to children, have been successfully given, in the character of a vermifuge; for this purpose, an infusion of a dram of the flowers dried, or half an ounce in their recent state, is the requisite dose. The leaves of the persica are also found to possess an anthelmintic power, and from a great number of experiments appear to have been given with invariable success both to children and adults. However, as the leaves and flowers of the persica manifest in some degree the quality of those of the laurocerasus, they ought to be used with caution. See AMYGDALUS.

PERSICARIA, in botany. See POLYGNUM.

PERSIMON PLUM. See DIOSPYROS.

To PERSIST. *v. n.* (*persisto*, Lat. *persister*, Fr.) To persevere; to continue firm; not to give over (*South*).

PERSISTENCE. PERSISTENCY. *s.* (from *persist*. Persistence seems more proper.) 1. The state of persisting; steadiness; constancy; perseverance in good or bad (*Government of the Tongue*). 2. Obstinacy; obduracy; contumacy (*Shakspeare*).

PERSISTIVE. *a.* (from *persist*.) Steady; not receding from a purpose; persevering (*Shakspeare*).

PERSIUS FLACCUS (Aulus), a Latin poet of Volaterræ. The early part of his life was spent in his native town, and at the age of sixteen he was removed to Rome, where he studied philosophy under Cornutus the celebrated Stoic. He also received the instructions of Palemon the grammarian, and Virginius the rhetorician. He distinguished himself by his satirical humour, and made the faults of the orators and poets of his age the subject of his poems. He did not even spare Nero, and the more effectually to expose the emperor to ridicule, he introduced into his satires some of his verses. Persius died in the 30th year of his age, A. D. 62. The satires of Persius are six in number, blamed by some for obscurity of style and of language. But though unintelligible to some, they were read with pleasure by his contemporaries, and the difficulties which now appear in them arise from their not knowing the various characters, the vices, and the errors which they censured.

PERSON. *s.* (*personne*, Fr. *persona*, Lat.) 1. Individual or particular man or woman. 2. Man or woman considered as opposed to things, or distinct from them (*Sprat*). 3. Individual; man or woman (*Pearson*). 4. Human being, considered with respect to mere corporal existence (*Dryden*). 5. Man or woman considered as present, acting or suffering (*Shakspeare*). 6. A general loose term for a human being; one; a man (*Clarissa*). 7. One's self; not a representative (*Dryden*). 8. Exterior appearance (*Shakspeare*). 9. Man or woman represented in a fictitious dialogue (*Baker*). 10. Character (*Hayward*). 11. Character of office (*South*). 12. (In grammar.) The quality of the noun that modifies the verb (*South*).

PERSON is defined by some metaphysicians, a distinct substance of a rational intelligent nature.

The word person, *persona*, is thought to be borrowed a *personando*, from personating or counterfeiting; and is supposed to have first signified a mask: because, as Boethius informs us, *in larva concava sonus volatur*: and hence the actors who appeared masked on the stage were sometimes called *larvati* and sometimes *personati*. He likewise says, that as the several actors represented each a single individual person, viz. *Œdipus*, or *Chremes*, or *Hecuba*, or *Medea*; for this reason, other people, who were at the same time distinguished by something in their form, character, &c. whereby they might be known, came likewise to be called by the Latins *personæ*, and by the Greeks

ὑποκρίματα. Again, as actors rarely represented any but great and illustrious characters, the word came at length to import the mind, as being that whose dispositions constitute the character. And thus men, angels, and even God himself, were called persons. Things merely corporeal, as a stone, a plant, or a horse, were called *hypostases* or *supposita*, but never persons. Hence the learned suppose, that the same name person came to be used to signify some dignity, whereby a person is distinguished from another: as a father, husband, judge, magistrate, &c. In this sense we are to understand that of Cicero: "Cæsar never speaks of Pompey but in terms of honour and respect: he does many hard and injurious things, however, against his person."

Person we have already defined to mean an individual substance of a reasonable nature. Now, a thing may be individual two ways: 1. Logically, because it cannot be predicated of any other; as Cicero, Plato, &c. 2. Physically; in which sense a drop of water, separated from the ocean, may be called an individual. Person is an individual nature in each of these senses: logically, according to Boethius, because person is not spoken of universals, but only of singulars and individuals; we do not say the person of an animal or a man, but of Cicero and Plato: and physically, since Socrates's hand or foot are never considered as persons. This last kind of individual is denominated two ways: positively, when the person is said to be the whole principle of acting; for, to whatever thing action is attributed, that the philosophers call a person: and negatively, as when we say, with the Thomists, &c. that a person consists in this, that it does not exist in another as a more perfect being. Thus a man, though he consists of two different things, viz. body and spirit, is not two persons; because neither part of itself is a complete principle of action, but one person, since the manner of his consisting of body and spirit is such as constitutes one whole principle of action; nor does he exist in any other as a more perfect being.

PERSONABLE. *a.* (from *person*.) 1. Handsome; graceful; of good appearance (*Raleigh*). 2. (In law.) One that may maintain any plea in a judicial court (*Ainsworth*).

PERSONAGE. *s.* (*personage*, French.) 1. A considerable person; a man or woman of eminence (*Sidney*). 2. Exterior appearance; air; stature (*Hayward*). 3. Character assumed (*Addison*). 4. Character represented (*Broome*).

PERSONAL. *a.* (*personel*, Fr. *personalis*, Latin.) 1. Belonging to men or women, not to things; not real (*Hooker*). 2. Affecting individuals or particular people; peculiar; proper to him or her; relating to one's private actions or character (*Rogers*). 3. Present; not acting by representative (*Shakspeare*). 4. Exterior; corporal (*Addison*). 5. (In law.) Something moveable; something appendant to the person, as money; not real, as land (*Davies*). 6. (In grammar.) A personal verb is that which has all the regular modifications

of the three persons; opposed to the impersonal, that has only the third.

PERSONALITY. *s.* (from *personal*.) The existence or individuality of any one (*Locke*).

PERSONALLY. *ad.* (from *personal*.) 1. In person; in presence; not by representative (*Hooker*). 2. With respect to an individual; particularly (*Bacon*). 3. With regard to numerical existence (*Rogers*).

PERSONATA. (from *persona*, a disguised person, because, according to Pliny, the ancient actors used to mask themselves with the leaves of this plant.) In botany, the great burdock. See **BARDANA**.

PERSONATE COROL. (*persona*, a mask.) In botany, a masked corol. Ringens, sed inter labia palato clausa. Ringent, but closed between the lips by the palate.—But surely ringent or gaping with the lips closed, is a contradiction in terms. It would better to define it, a species of labiate corol with the lips closed. See **LABIATE**.

Tournefort, from whom Linnéus adopted these terms, is clear and precise in his distinction. A labiate flower, according to him, is drawn out at bottom into a tube, and is widened at top either into one or two lips. The pistil becomes a fruit of four seeds ripening in the calyx as in a capsule: as in *salvia*, *horminum*, *marrubium*, *chamædryis*.—A personate flower differs from this in having the pistil becoming a capsule entirely distinct from the calyx. It has something of the same appearance as the labiate flower; but does not ill represent a mask, or the snout of some animals. This he exemplifies in *linaria*, *antirrhinum*, *pedicularis*, *melampyrum*.—There are some irregular monopetalous flowers which Linnéus includes under his ringents, that are neither the labiate nor personate of Tournefort: as *digitalis* and *scrophularia*.

TO PERSONATE. *v. a.* (from *persona*, Lat.) 1. To represent by a fictitious or assumed character, so as to pass for the person represented (*Bacon*). 2. To represent by action or appearance; to act (*Crashaw*). 3. To pretend hypocritically (*Swift*). 4. To counterfeit; to feign (*Hammond*). 5. To resemble (*Shakspeare*). 6. To make a representative of, as in picture: out of use (*Shakspeare*). 7. To describe: out of use (*Shakspeare*).

PERSONATION. *s.* (from *personate*.) Counterfeiting of another person (*Bacon*).

PERSONIFICATION. *s.* (from *personify*.) Prosopopœia; the change of things to persons: as, *Confusion* heard his voice.

TO PERSONIFY. *v. a.* (from *person*.) To change from a thing to a person.

PERSOONIA, in botany, a genus of the class tetrandria, order monogynia. Calyxless; petals four, bearing the stamens towards the base; glands four at the base of the germ; stigma obtuse; drupe one-seeded. Two species; Australasian plants, with linear or lanceolate leaves; and solitary, axillary flowers of a yellow hue.

PERSPECTIVE, the art of delineating visible objects on a plain surface, such as they ap-

pear at a given distance, or height, upon a transparent plane, placed commonly perpendicular to the horizon, between the eye and the object. This is particularly called

Linear perspective, as regarding the position, magnitude, form, &c. of the several lines, or contours of objects, and expressing their diminution.

Some make this a branch of optics; others an art and science derived from it: its operations however are all geometrical.

HISTORY OF PERSPECTIVE.—This art derives its origin from painting, and particularly from that branch of it which was employed in the decorations of the theatre, where landscapes were chiefly introduced. Vitruvius, in the proem to his 7th book, says that Agatharchus, at Athens, was the first author who wrote upon this subject, on occasion of a play exhibited by Æschylus, for which he prepared a tragic scene; and that afterwards the principles of the art were more distinctly taught in the writings of Democritus and Anaxagoras, the disciples of Agatharchus, which are not now extant.

The perspective of Euclid and of Heliodorus Larisseus contains only some general elements of optics, that are by no means adapted to any particular practice; though they furnish some materials that might be of service even in the linear perspective of painters.

Geminus, of Rhodes, a celebrated mathematician, in Cicero's time, also wrote upon this science.

It is also evident that the Roman artists were acquainted with the rules of perspective, from the account which Pliny (*Nat. Hist. lib. 35, cap. 4.*) gives of the representation on the scene of those plays given by Claudius Pulcher; by the appearance of which the crowds were so deceived, that they endeavoured to settle on the fictitious roofs. However, of the theory of this art among the ancients we know nothing; as none of their writings have escaped the general wreck of ancient literature in the dark ages of Europe. Doubtless this art must have been lost, when painting and sculpture no longer existed. However, there is reason to believe that it was practised much later in the Eastern empire.

John Tzetzes, in the 12th century, speaks of it as well acquainted with its importance in painting and statuary. And the Greek painters, who were employed by the Venetians and Florentines, in the 13th century, it seems brought some optical knowledge along with them into Italy: for the disciples of Giotto are commended for observing perspective more regularly than any of their predecessors in the art had done; and he lived in the beginning of the 14th century.

The Arabians were not ignorant of this art; as may be presumed from the optical writings of Alhazen, about the year 1100. And Vitellus, a Pole, about the year 1270, wrote largely and learnedly on optics. And, of our own nation, friar Bacon, as well as John Peckham, archbishop of Canterbury, treated this subject with surprising accuracy, considering the times in which they lived.

The first authors who professedly laid down rules of perspective were Bartolomeo Bramantino, of Milan, whose book, *Regole di Perspectiva, e Misure delle Antichità di Lombardia*, is dated 1440; and Pietro del Borgo, likewise an Italian, who was the most ancient author met with by Ignatius Danti, and who it is supposed died in 1443. This last writer supposed objects placed beyond a transparent tablet, and so to trace the images, which rays of light, emitted from them, would make upon it.

PERSPECTIVE.

And Albert Durer constructed a machine upon the principles of Borgo, by which he could trace the perspective appearance of objects.

Leon Battista Alberti, in 1450, wrote his treatise *De Pictura*, in which he treats chiefly of perspective.

Balthazar Peruzzi, of Siena, who died in 1536, had diligently studied the writings of Borgo; and his method of perspective was published by Serlio in 1540. To him it is said we owe the discovery of points of distance, to which are drawn all lines that make an angle of 45° with the ground line.

Guido Ubaldo, another Italian, soon after discovered, that all lines that are parallel to one another, if they be inclined to the ground line, converge to some point in the horizontal line; and that through this point also will pass a line drawn from the eye parallel to them. His perspective was printed at Pisaro in 1600, and contained the first principles of the method afterwards discovered by Dr. Brook Taylor.

In 1583 was published the work of Giacomo Barozzi, of Vignola, commonly called Vignola, intitled the two rules of perspective, with a learned commentary by Ignatius Danti. In 1615 Marolois' work was printed at the Hague, and engraved and published by Hondius. And in 1625, Sirigatti published his treatise of perspective, which is little more than an abstract of Vignola's.

Since that time the art of perspective has been gradually improved by subsequent geometricians, particularly by professor Gravesande, and still more by Dr. Brook Taylor, whose principles are in a great measure new, and far more general than those of any of his predecessors. He did not confine his rules, as they had done, to the horizontal plane only, but made them general, so as to affect every species of lines and planes, whether they were parallel to the horizon or not; and thus his principles were made universal. Besides, from the simplicity of his rules, the tedious progress of drawing out plans and elevations for any object, is rendered useless, and therefore avoided; for by this method, not only the fewest lines imaginable are required to produce any perspective representation, but every figure thus drawn will bear the nicest mathematical examination: Farther, his system is the only one calculated for answering every purpose of those who are practitioners in the art of design; for by it they may produce either the whole, or only so much of an object as is wanted; and by fixing it in its proper place, its apparent magnitude may be determined in an instant. It explains also the perspective of shadows, the reflection of objects from polished planes, and the inverse practice of perspective.

His *Linear Perspective* was first published in 1715; and his *New Principles of Linear Perspective* in 1719, which he intended as an explanation of his first treatise. And his method has been chiefly followed by all others since.

In 1738, Mr. Hamilton published his *Stereography*, in 2 vols. folio, after the manner of Dr. Taylor. But the neatest system of perspective, both as to theory and practice, on the same principles, is that of Mr. Kirby. There are also good treatises on the subject, by Desargues, de Bosse, Albertus, Lamy, Nicéron, Pozzo the Jesuit, Ware, Cowley, Priestly, Ferguson, Emerson, Malton, Henry Clarke, &c. &c. A new edition of Brook Taylor's *Perspective* has been recently published, as well as a very ingenious treatise founded on the same principles, by Mr. Creswell, of Trinity College, Cambridge.

Principles of perspective.—In order to understand the principles of perspective, it will be proper to consider the plane on which the representation is to be made as transparent, and interposed between the eye of the spectator and the object to be represented. Thus, suppose a person at a window looks through an upright pane of glass at any object beyond it, and, keeping his head steady, draws the figure of the object upon the glass with a black-lead pencil, as if the point of the pencil touched the object itself; he would then have a true representation of the object in perspective as it appears to his eye.

To this purpose two things are necessary: first, that the glass be laid over with strong gum-water, which, when dry, will be fit for drawing upon, and will retain the traces of the pencil; and, secondly, that he looks through a small hole in a thin plate of metal, fixed about a foot from the glass, between it and his eye, and that he keeps his eye close to the hole; otherwise he might shift the position of his head, and consequently make a false delineation of the object.

Having traced out the figure of the object, he may go over it again with pen and ink; and, when that is dry, put a sheet of paper upon it, and trace it thereon with a pencil: then taking away the paper, and laying it on a table, he may finish the picture by giving it the colours, lights, and shades, as he sees them in the object itself; and then he will have a true resemblance of the object.

To every person who has a general knowledge of the principles of optics, this must be self-evident: for, as vision is occasioned by pencils of rays coming in straight lines to the eye from every point of the visible object, it is plain that, by joining the points in the transparent plane through which all those pencils respectively pass, an exact representation must be formed of the object, as it appears to the eye in that particular position, and at that determined distance; and were pictures of things to be always first drawn on transparent planes, this simple operation, with the principle on which it is founded, would comprise the whole theory and practice of perspective. As this, however, is far from being the case, rules must be deduced from the sciences of optics and geometry for drawing representations of visible objects on opaque planes; and the application of these rules constitutes what is properly called the art of perspective.

Previous to our laying down the fundamental principles of this art, it may not be improper to observe, that when a person stands right against the middle of one end of a long avenue or walk, which is straight and equally broad throughout, the sides thereof seem to approach nearer and nearer to each other as they are further and further from his eye; or the angles, under which their different parts are seen, become less and less according as the distance from his eye increases; and if the avenue be very long, the sides of it at the farthest end will seem to meet: and there an object that would cover the whole breadth of the avenue, and be of a height equal to that breadth, would appear only to be a mere point.

Having made these preliminary observations, we now proceed to the practice of perspective, which is built upon the following

Fundamental THEOREM I.

Let $a b c d$ (fig. 1. plate 134.) represent the ground-plan of the figure to be thrown into perspective, and $e f g h$ the transparent plane through

P E R S P E C T I V E.

which it is viewed by the eye at E. Let these planes intersect in the straight line kl . Let B be any point in the ground-plan, and BE a straight line, the path of a ray of light from that point to the eye. This will pass through the plane $efgh$ in some point b ; or B will be seen through that point, and b will be the picture, image, or representation of B.

If BA be drawn in the ground-plan, making any angle BAK with the common intersection, and E V be drawn parallel to it, meeting the picture-plane or perspective-plane in V, and VA be drawn, the point b is in the line VA so situated that BA is to EV as BA to bV .

For since EV and BA are parallel, the figure BAVEb is on one plane, cutting the perspective-plane in the straight line VA; the triangles BAb, EVb, are similar, and BA: EV = bA : bV .

Cor. 1.—If B be beyond the picture, its picture b is above the intersection kb ; but if B be between the eye and the picture, as at B', its picture b' is below kb .

2. If two other parallel lines BA', ES, be drawn, and A', S, be joined, the picture of B is in the intersection of the lines AV and A'S.

3. The line BA is represented by bA , or bA is the picture of BA; and if AB be infinitely extended, it will be represented by AV. V is therefore called the vanishing point of the line AB.

4. All lines parallel to AB are represented by lines converging to V from the points where these lines intersect the perspective-plane; and therefore V is the vanishing point of all such parallel lines.

5. The pictures of all lines parallel to the perspective-plane are parallel to the lines themselves.

6. If through V be drawn HVD parallel to kl , the angle EVH is equal to BAK.

Remark.—The proposition now demonstrated is not limited to any inclination of the picture-plane to the ground-plane: but it is usual to consider them as perpendicular to each other, and the ground plan as horizontal. Hence the line kl is called the ground-line, and OH the horizon-line; and VK perpendicular to both, is called the height of the eye.

If ES be drawn perpendicular to the picture-plane, it will cut it in a point S of the horizon-line directly opposite to the eye. This is called the point of sight, or principal point.

7. The pictures of all vertical lines are vertical, and the pictures of horizontal lines are horizontal, because these lines are parallel to the perspective-plane.

8. The point of sight S is the vanishing point of all lines perpendicular to the perspective-plane.

The above proposition is a sufficient foundation for the whole practice of perspective, whether of direct or inclined pictures, and serves to suggest all the various practical constructions, each of which has advantages which suit particular purposes. Writers on the subject have either confined themselves to one construction, from an affectation of simplicity or fondness for system; or have multiplied precepts, by giving every construction for every example, in order to make a great book, and give the subject an appearance of importance and difficulty. An ingenious practitioner will avoid both extremes, and avail himself of the advantage of each construction as it happens to suit his purpose. We shall now proceed to the practical rules, which require no consideration of intersecting planes, and are all performed on the perspective plane by means of certain substitutions for the place of the eye and the original figure. The general substitution is as follows:

Let the plane of the paper be first supposed to be the ground-plan, and the spectator to stand at F (fig. 2.) Let it be proposed that the ground-plan is to be represented on a plane surface, standing perpendicularly on the line GK of the plan, and that the point K is immediately opposite to the spectator, or that FK is perpendicular to GL: then FK is equal to the distance of the spectator's eye from the picture.

Now suppose a piece of paper laid on the plan with its straight edge lying on the line GL; draw on this paper KS perpendicular to GL, and make it equal to the height of the eye above the ground-plan. This may be much greater than the height of a man, because the spectator may be standing on a place much raised above the ground-plan. Observe also that KS must be measured on the same scale on which the ground-plan and the distance FK were measured. Then draw HSO parallel to GL. This will be a horizontal line, and (when the picture is set upright on GL) will be on a level with the spectator's eye, and the point S will be directly opposite to his eye. It is therefore called the principal point, or point of sight. The distance of his eye from this point will be equal to FK. Therefore make SP (in the line SK) equal to FK, and P is the projecting point or substitute for the place of the eye. It is sometimes convenient to place P above S, sometimes to one side of it on the horizontal line, and in various other situations; and writers, ignorant of or inattentive to the principles of the theory, have given it different denominations, such as point of distance, point of view, &c. It is merely a substitute for the point E in fig. 1. and its most natural situation is below, as in this figure.

The art of perspective is conveniently divided into ichnography, which teaches how to make a perspective draught of figures on a plane, commonly called the ground-plan; and scenography, which teaches how to draw solid figures, or such figures as are raised above this plan.

Fundamental Prob. 1.—To put into perspective any given point of the ground-plan.

First general construction.

From B and P (fig. 2.) draw any two parallel lines BA, PV, cutting the ground-line and horizon-line in A and V, and draw BP, AV, cutting each other in b ; b is the picture of B.

For it is evident that BA, PV, of this figure are analogous to BA and EV of fig. 1. and that BA: PV = bV .

If BA' be drawn perpendicular to GL, PV will fall on PS, and need not be drawn. AV' will be A'S.—This is the most easy construction, and is nearly the same with Ferguson's.

Second general construction.

Draw two lines BA, BA', and two lines PV, PD parallel to them, and draw AV, A'D, cutting each other in b ; b is the picture of B by Cor. 2.—This construction is the foundation of all the rules of perspective that are to be found in the books on this subject. They appear in a variety of forms, owing to the ignorance or inattention of the authors to the principles. The rule most generally adhered to is as follows:

Draw BA (fig. 3.) perpendicular to the ground-line, and AS to the point of sight, and set off A β equal to BA. Set off SD equal to the distance of the eye in the opposite direction from S that β is from A, where B and E of fig. 1. are on opposite sides of the picture; otherwise set them the same way. D is called the point of distance. Draw β D

PERSPECTIVE.

cutting AS in B. This is evidently equivalent to drawing BA and PS perpendicular to the ground-line and horizon-line, and B β and PD, making an angle of 45° with these lines, with the additional puzzle about the way of setting off A β and SD, which is avoided in the construction here given.

This usual construction, however, by a perpendicular and the point of distance, is extremely simple and convenient; and two points of distance, one on each side of S, serve for all points of the ground-plan. But the first general construction requires still fewer lines, if BA be drawn perpendicular to GL, because PV will then coincide with PS.

Third general construction.

Draw BA from the given point B perpendicular to the ground-line, and AS to the point of sight. From the point of distance D set off D d equal to BA, on the same or the contrary side as S, according as B is on the same or the contrary side of the picture as the eye. Join d , A, and draw D δ parallel to dA . b is the picture of B. For SD, D d , are equal to the distances of the eye and given point from the picture, and SD: D d = bS : bA .

This construction does not naturally arise from the original lines, but it is a geometrical consequence from their position and magnitude; and it is of all others the most generally convenient, as the perpendicular distances of any number of points may be arranged along SD without confusion, and their direct situations transferred to the ground-line by perpendiculars such as BA; and nothing is easier than drawing parallels, either by a parallel-ruler or a bevel-square, used by all who practise drawing.

PROB. 2.—To put any straight line BC (fig. 4. plate 134.) of the ground-plan in perspective.

Find the pictures b , c , of its extreme points by any of the foregoing constructions, and join them by the straight line bc .

Perhaps the following construction will be found very generally convenient.

Produce CB till it meet the ground-line in A, and draw PV parallel to it, and AV, and PB, PC, cutting AV in b , c . V is its vanishing point, by Cor. 3. of the fundamental theorem.

It must be left to the experience and sagacity of the drawer to select such constructions as are most suitable to the multiplicity of the figures to be drawn.

PROB. 3.—To put any rectilinear figure of the ground-plan in perspective.

Put the bounding lines in perspective, and the problem is solved.

The variety of constructions of this problem is very great, and it would fill a volume to give them all. The most generally convenient is to find the vanishing points of the bounding lines, and connect these with the points of their intersection with the ground-line. For example, to put the square ABCD (fig. 5.) into perspective.

Draw from the projecting point PV, PW, parallel to AB, BC, and let AB, BC, CD, DA, meet the ground-line in a , x , β , δ , and draw aV , δV , xW , βW , cutting each other in $a b c d$, the picture of the square ABCD. The demonstration is evident.

This construction, however, runs the figure to great distances on each side of the middle line when any of the lines of the original figure are nearly parallel to the ground-line.

The following construction (fig. 6.) avoids this inconvenience.

Let D be the point of distance. Draw the per-

pendiculars A a , B β , C γ , D δ , and the lines A e , B f , C g , D h , parallel to P.D. Draw S a , S β , S γ , S δ , and D e , D f , D g , D h , cutting the former in a , b , c , d , the angles of the picture.

It is not necessary that D be the point of distance, only the lines A e , B f , &c. must be parallel to PD.

Remark.—In all the foregoing constructions the necessary lines (and even the finished picture) are frequently confounded with the original figure. To avoid this great inconvenience, the writers on perspective direct us to transpose the figure; that is, to transfer it to the other side of the ground-line, by producing the perpendiculars A a , B β , C γ , D δ , till A A' , B B' , &c. are respectively equal to A a , B β , &c.; or, instead of the original figure, to use only its transposed substitute A'B'C'D'. This is an extremely proper method. But in this case the point P must also be transposed to P' above S, in order to retain the first or most natural and simple construction, as in fig. 7.; where it is evident that when BA=A'B', and SP=SP', and B'P' is drawn, cutting AS in b , we have bA : bS =B'A': P'S'=BA: PS, and b is the picture of B: whence follows the truth of all the subsequent constructions with the transposed figure.

PROB. 4.—To put any curvilinear figure on the ground-plan into perspective.

Put a sufficient number of its points in perspective by the foregoing rules, and draw a curve line through them.

It is well known that the conic sections and some other curves, when viewed obliquely, are conic sections or curves of the same kinds with the originals, with different positions and proportions of their principal lines, and rules may be given for describing their pictures founded on this property. But these rules are very various, unconnected with the general theory of perspective, and more tedious in the execution, without being more accurate than the general rule now given. It would be a useless affectation to insert them in this elementary treatise.

We come in the next place to the delineation of figures not in a horizontal plane, and of solid figures. For this purpose it is necessary to demonstrate the following

THEOREM II.

The length of any vertical line standing on the ground-plane is to that of its picture, as the height of the eye to the distance of the horizon-line from the picture of its foot.

Let BC be the vertical line standing on B, and let EF be a vertical line through the eye. Make BD equal to EF, and draw DE, CE, BE. It is evident that DE will cut the horizon-line in some point d , CE will cut the picture-plane in e , and BE will cut it in b , and that bc will be the picture of BC, and is vertical, and that BC is to bc as BD to bd , or as EF to bd .

Cor. The picture of a vertical line is divided in the same ratio as the line itself. For BC: BM = bc : bm .

PROB. 5.—To put a vertical line of a given length in perspective standing on a given point of the picture.

Through the given point b (fig. 8. plate 134.) of the picture, draw S b A from the point of sight, and draw the vertical line AD, and make AE equal to the length or height of the given line. Join ES, and draw bc parallel to AD, producing bc , when necessary, till it cut the horizontal line in d , and we have bc : bd =AD: AE, that is, as the

Mathew St. John, del.

PERSPECTIVE.

length of the given line to the height of the eye, and $b d$ is the distance of the horizon-line from the point b , which is the picture of the root of the line. Therefore (Theor. 2.) $b c$ is the required picture of the vertical line.

This problem occurs frequently in views of architecture; and a compendious method of solving it would be peculiarly convenient. For this purpose, draw a vertical line XZ at the margin of the picture, or on a separate paper, and through any point V of the horizon-line draw VX . Set off XY , the height of the vertical line, and draw VY . Then from any points b, r , on which it is required to have the pictures of lines equal to XY , draw $bS, r t$, parallel to the horizon-line, and draw the verticals $Sz, t v$: these have the lengths required, which may be transferred to b and r . This, with the third general construction for the base points, will save all the confusion of lines which would arise from constructing each line apart.

PROB. 6.—To put any sloping line in perspective. From the extremities of this line, suppose perpendiculars making the ground-plane in two points, which we shall call the base points of the sloping line. Put these base points in perspective, and draw, by last problem, the perpendiculars from the extremities. Join these by a straight line. It will be the picture required.

PROB. 7.—To put a square in perspective, as seen by a person not standing right against the middle of either of its sides, but rather nearly even with one of its corners.

In fig. 1. plate 135. let $ABCD$ be a true square, viewed by an observer, not standing at o , directly against the middle of its side AD , but at O almost even with its corner D , and viewing the side AD under the angle AOD ; the angle AoD (under which he would have seen AD from o) being 60 degrees.

Make AD in fig. 2. equal to AD in fig. 1. and draw SP and OO parallel to AD . Then, in fig. 10. let O be the place of the observer's eye, and SO be perpendicular to SP ; then S shall be the point of sight in the horizon SP .

Take SO in your compasses, and set that extent from S to P : then P shall be the true point of distance, taken according to the foregoing rules.

From A and D draw the straight lines AS and DS ; draw also the straight line AP , intersecting DS in C .

Lastly, to the point of intersection C , draw BC parallel to AD ; and $ABCD$ in fig. 2. will be a true perspective representation of the square $ABCD$ in fig. 1. The point M is the centre of each square, and AMC and BMD are the diagonals.

PROB. 8.—To put a reticulated square in perspective, as seen by a person standing opposite to the middle of one of its sides.

A reticulated square is one that is divided into several little squares, like net-work, as fig. 4. each side of which is divided into four equal parts, and the whole surface into four times four (or 16) equal squares.

Having divided this square into the given number of lesser squares, draw the two diagonals AxC and BxD .

Make AD in fig. 5. equal to AD in fig. 11. and divide it into four equal parts, as $Ae, eg, g i$, and iD .

Draw SP for the horizon, parallel to AD , and, through the middle point g of AD , draw OS perpendicular to AD and SP . Make S the point of sight, and O the place of the observer's eye.

Take SP equal to SO , and P shall be the true point of distance.

Draw AS and DS to the point of sight, and AP to the point of distance, intersecting DS in C : then draw BC parallel to AD , and the outlines of the reticulated square $ABCD$ will be finished.

From the division points, e, g, i , draw the straight lines ef, gh, ik , tending towards the point of sight S ; and draw BD for one of the diagonals of the square, the other diagonal AC being already drawn.

Through the points r and s , where these diagonals cut ef and ik , draw lm parallel to AD . Through the centre point x , where the diagonals cut gh , draw no parallel to AD . Lastly, through the points v and w , where the diagonals cut ef and ik , draw $p q$ parallel to AD ; and the reticulated perspective square will be finished.

This square is truly represented, as if seen by an observer standing at O , and having his eye above the horizontal plane $ABCD$ on which it is drawn; as if OS was the height of his eye above that plane; and the lines which form the small squares within it have the same letters of reference with those in fig. 11. which is drawn as it would appear to an eye placed perpendicularly above its centre, x .

PROB. 9.—To put a circle in perspective.

If a circle be viewed by an eye placed directly over its centre, it appears perfectly round; but if it be obliquely viewed, it appears of an elliptical shape. This is plain by looking at a common wine glass set upright on a table.

Make a true reticulated square, as fig. 4. plate 135. of the same diameter as you would have the circle: and setting one foot of your compasses in the centre x , describe as large a circle as the sides of the square will contain. Then, having put this reticulated square into perspective, as in fig. 12. observe through what points of the cross lines and diagonals of fig. 11. the circle passes; and through the like points in fig. 12. draw the ellipsis, which will be as true a perspective representation of the circle, as the square in fig. 12. is of the square in fig. 11.

PROB. 10.—To put a cube in perspective, as if viewed by a person standing almost even with one of its edges, and seeing three of its sides.

In fig. 3. plate 135. let AB be the breadth of either of the six equal square sides of the cube AG : O the place of the observer, almost even with the edge CD of the cube, S the point of sight, SP the horizon parallel to AD , and P the point of distance taken as before.

Make $ABCD$ a true square; draw BS and CS to the point of sight, and BP to the point of distance, intersecting CS in G . Then draw FG parallel to BC , and the uppermost perspective square side $BFGC$ of the cube will be finished.

Draw DS to the point of sight, and AP to the point of distance, intersecting DS in the point I then draw GI parallel to CD ; and, if the cube be an opaque one, as of wood or metal, all the outlines of it will be finished; and then it may be shaded as in the figure.

But if you want a perspective view of a transparent glass cube, all the sides of which will be seen, draw AH toward the point of sight, FH parallel to BA , and HI parallel to AD : then $AHID$ will be the square base of the cube, perspectively parallel to the top $BFGC$; $ABFH$ will be the square side of the cube, parallel to $CGID$, and $FGHI$ will be the square side parallel to $ABCD$.

PROB. 11.—To put any solid in perspective.

Put the base of the solid, whatever it be, in perspective by the preceding rules. From each

PERSPECTIVE.

bounding point of the base, raise lines representing in perspective the altitude of the object; by joining these lines and shading the figure according to the directions in the preceding problem, you will have a scenographic representation of the object. This rule is general; but as its application to particular cases may not be apparent, it will be proper to give the following example of it.

PROB. 12.—To put a square pyramid in perspective, as standing upright on its base, and viewed obliquely.

In fig. 6. No. 1. of plate 135. let AD be the breadth of either of the four sides of the pyramid ATCD at its base ABCD; and MT its perpendicular height. Let O be the place of the observer, S his point of sight, SE his horizon, parallel to AD and perpendicular to OS; and let the proper point of distance be taken in SE produced toward the left hand, as far from S as O is from S.

Draw AS and DS to the point of sight, and DL to the point of distance, intersecting AS in the point B. Then, from B, draw BC parallel to AD; and ABCD shall be the perspective square base of the pyramid.

Draw the diagonal AC, intersecting the other diagonal BD at M, and this point of intersection shall be the centre of the square base.

Draw MT perpendicular to AD, and of a length equal to the intended height of the pyramid: then draw the straight outlines AT, CT, and DT; and the outlines of the pyramid (as viewed from O) will be finished; which being done, the whole may be so shaded as to give it the appearance of a solid body.

If the observer has stood at o, he could have only seen the side ATD of the pyramid; and two is the greatest number of sides that he could see from any other place of the ground. But if he were at any height above the pyramid, and had his eye directly over its top, it would then appear as in N^o. 2. and he would see all its four sides E, F, G, H, with its top t just over the centre of its square base ABCD; which would be a true geometrical and not a perspective square.

PROB. 13.—To put two equal squares in perspective, one of which shall be directly over the other, at any given distance from it, and both of them parallel to the plane of the horizon.

In fig. 7. plate 135. let ABCD be a perspective square on a horizontal plane, drawn according to the foregoing rules, S being the point of sight, SP the horizon (parallel to AD), and P the point of distance.

Suppose AD, the breadth of the square, to be three feet; and that it is required to place just such another square EFGH directly above it, parallel to it and two feet from it.

Make AE and DH perpendicular to AD, and two thirds of its length draw EH, which will be equal and parallel to AD; then draw ES and HS to the point of sight S, and EP to the point of distance P, intersecting HS in the point G: this done, draw FG parallel to EH; and you will have two perspective squares ABCD and EFGH, equal and parallel to one another, the latter directly above the former, and two feet distant from it; as was required.

By this method shelves may be drawn parallel to one another, at any distance from each other in proportion to their length.

PROB. 14.—To put a square table in perspective, standing on four upright square legs of any given length with respect to the breadth of the table.

In fig. 7. plate 135. let ABCD be the square

part of the floor on which the table is to stand, and EFGH the surface of the square table, parallel to the floor.

Suppose the table to be three feet in breadth, and its height from the floor to be two feet; then two thirds of AD or EH will be the length of the legs i and l ; the other two (l and m) being of the same length in perspective.

Having drawn the two equal and parallel squares ABCD and EFGH, as shown in prob. 13. let the legs be square in form, and fixed into the table at a distance from its edges equal to their thickness. Take Aa and Dd equal to the intended thickness of the legs, and a b and d c also equal thereto. Draw the diagonals AC and BD, and draw straight lines from the points a , b , c , d , towards the point of sight S, and terminating at the side BC. Then, through the points where these lines cut the diagonals, draw the straight lines n and o , p and q , parallel to AD: and you will have formed four perspective squares (like ABCD in fig. 6. N^o. 1.) for the bases of the four legs of the table: and then it is easy to draw the four upright legs by parallel lines, all perpendicular to AD; and to shade them as in the figure.

To represent the intended thickness of the table board, draw e h parallel to EH, and HG toward the point of sight S: then shade the spaces between these lines, and the perspective figure of the table will be finished.

PROB. 15.—To put three rows of upright square objects in perspective, equal in size, and at equal distances from each other, on an oblong square plane, the breadth of which shall be of any assigned proportion to the length thereof.

Fig. 8. plate 135. is a perspective representation of an oblong square plane, three times as long as it is broad, having a row of nine upright square objects on each side, and one of the same number in the middle; all equally high, and at equal distances from one another, both long-wise and cross-wise, on the same plane.

In fig. 1. plate 136. PS is the horizon, S the point of sight, P the point of distance, and AD (parallel to PS) the breadth of the plane.

Draw AS, NS, and DS, to the point of sight S; the point N being in the middle of the line AD: and draw DP to the point of distance P, intersecting AS in the point B: then, from B draw BC parallel to AD, and you have the perspective square ABCD.

Through the point i , where DB intersects NS, draw a e parallel to AD; and you will have subdivided the perspective square ABCD into four lesser squares, as A a i N, N i e D, a B k i, and i k C e.

From the point C (at the top of the perspective square ABCD) draw CP to the point of distance P, intersecting AS in E; then, from the point E draw EF parallel to AD; and you will have the second perspective square BEFC.

Through the point l , where CE intersects NS, draw b f parallel to AD; and you will have subdivided the square BEFC into the four squares B b l k, k l f C, b E m l, and l m f f.

From the point F (at the top of the perspective square BEFC) draw FP to the point of distance P, intersecting AS in I; then from the point I draw IK parallel to AD, and you will have the third perspective square EIKF.

Through the point n , where FI intersects NS, draw c g parallel to AD; and you will have subdivided the square EIKF into four lesser squares, E e n m, m n g f, e I o n, and n o K g.

From the point K (at the top of the third per-

PERSPECTIVE.

spective square *EIKF* draw *KP* to the point of distance *P*, intersecting *AS* in *L*; then from the point *L* draw *LM* parallel to *AD*; and you will have the fourth perspective square *ILMK*.

Through the point *p*, where *KL* intersects *NS*, draw *dh* parallel to *AD*; and you will have subdivided the square *ILMK* into the four lesser squares *ldpo*, *opbk*, *dLqp*, and *pgmh*.

Thus we have formed an oblong square *ALMD*, whose perspective length is equal to four times its breadth, and it contains 16 equal perspective squares. If greater length was still wanted, we might proceed further on toward *S*.

Take *A 3*, equal to the intended breadth of the side of the upright square object *AQ* (all the other sides being of the same breadth), and *AO* for the intended height. Draw *O 18* parallel to *AD*, and make *D 8* and *4 7* equal to *A 3*; then draw *3 8*, *4 8*, *7 8*, and *8 8*, to the point of sight *S*; and among them we shall have the perspective square bases of all the 27 upright objects on the plane.

Through the point *9*, where *DB* intersects *8 8*, draw *1 10* parallel to *AD*, and you have the three perspective square bases *A 1 2 3*, *4 5 6 7*, *8 9 10*, of the three upright square objects at *A*, *N*, and *D*.

Through the point *21*, where *eb* intersects *8 8*, draw *14 11*, parallel to *AD*; and you will have the three perspective squares *a 14 15 16 17 18 19 20*, and *21 11 e 22* for the bases of the second cross-row of objects; namely, the next beyond the first three at *A*, *N*, and *D*.

Through the point *w*, where *CE* intersects *8 8*, draw a line parallel to *BC*; and you will have three perspective squares, at *B*, *k*, and *C*, for the bases of the third row of objects; one of which is set up at *B*.

Through the point *x*, where *fc* intersects *8 8*, draw a line parallel to *bf*; and you will have three perspective squares, at *b*, *l*, and *x*, for the bases of the fourth cross-row of objects.

Go on in this manner, as you see in the figure, to find the rest of the square bases, up to *LM*; and you will have 27 upon the whole oblong square plane, on which you are to place the like number of objects, as in fig. 8. plate 135.

Having assumed *AO* for the perspective height of the three objects at *A*, *N*, and *D* (fig. 1. plate 138.) next the observer's eye, and draw *O 18* parallel to *AD*, in order to make the objects at *N* and *D* of the same height as that at *O*; and having drawn the upright lines *4 15*, *7 8*, *X*, and *D 22*, for the heights *N* and *D*; draw *OS* and *RS*, *15 S* and *WS*, *XS* and *22 S*, all to the point of sight *S*; and these lines will determine the perspective equal heights of all the rest of the upright objects, as shown by the two placed at *a* and *B*.

To draw the square tops of these objects, equal and parallel to their bases, we need only give one example, which will serve for all.

Draw *3 R* and *2 Q* parallel to *AO*, and up to the line *RS*; then draw *PQ* parallel to *OR*, and *OPQR* shall be the top of the object at *A*, equal and parallel to its square base *A 1 2 3*.—In the same easy way the tops of all the other objects are formed.

When all the rest of the objects are delineated, shade them properly, and the whole perspective scheme will have the appearance of fig. 8. plate 135.

PROB. 16.—To put stairs with equal and parallel steps in perspective.

In fig. 2. of plate 136. let *a b* be the given breadth of each step, and *a i* the height thereof.

Make *bc*, *cd*, *de*, &c. each equal to *ab*; and draw all the upright lines *ai*, *bl*, *cn*, *dp*, &c. perpendicular to *ah* (to which the horizon *as* is parallel); and from the points *i*, *l*, *n*, *p*, *r*, &c. draw the equidistant lines *i B*, *l C*, *n D*, &c. parallel to *ah*; these distances being equal to that of *i B* from *uh*.

Draw *x i* touching all the corner-points *i*, *n*, *p*, *r*, *t*, *v*; and draw *2 16* parallel to *x i*, as far from it as you want the length of the steps to be.

Toward the point of sight *S* draw the lines *a 1*, *i 2*, *k 3*, *l 4*, &c. and draw *16 15*, *14 13*, *12 11*, *10 9*, *8 7*, *6 5*, *4 3*, and *2 1*, all parallel to *ah*, and meeting the lines *w 15*, *u 13*, *s 11*, &c. in the points *15*, *13*, *11*, *9*, *7*, *5*, *3*, and *1*: then from these points draw *15 14*, *13 12*, *11 10*, *9 8*, *7 6*, *5 4*, and *3 2*, all parallel to *ha*; and the outlines of the steps will be finished. From the point *16*, draw *16 A* parallel to *ba*, and *A x 16* will be part of the flat at the top of the uppermost step. This done, shade the work as in fig. 3, and the whole will be finished.

PROB. 17.—To put stairs with flats and openings in perspective, standing on a horizontal pavement of squares.

In fig. 4. plate 136. having made *S* the point of sight, and drawn a reticulated pavement *AB* with black-lead lines, which may be rubbed out again; at any distance of the side *AB* of the pavement which is nearest to the eye, and at any point where you choose to begin the stair at that distance, as *a*, draw *G a* parallel to *BA*, and take *a b* at pleasure for the height of each step.

Take *a b* in your compasses, and set that extent as many times upward from *F* to *E* as is equal to the first required number of steps *O*, *N*, *M*, *L*, *K*; and from these points of division in *EF* draw *1 b*, *2 d*, *3 f*, *4 h*, and *E k*, all equidistant from one another, and parallel to *F a*: then draw the equidistant upright lines *a b*, *td*, *uf*, *vh*, *w k*, and *I m*, all perpendicular to *F a*; then draw *m b*, touching the outer corners of these steps at *m*, *k*, *h*, *f*, *d*, and *b*; and draw *ns* parallel to *m b*, as far from it as you want the length of the steps *K*, *L*, *M*, *N*, *O* to be.

Towards the point of sight *S* draw *m n*, *l 5*, *k o*, *i 6*, *hp*, *f q*, *d r*, and *bs*. Then (parallel to the bottom line *BA*) through the points *n*, *o*, *p*, *q*, *r*, *s*, draw *n 8*; *5 14*; *6 15*; *7 16*; *1 17*; and *2 s*: which done, draw *n 5* and *o 6* parallel to *lm*, and the outlines of the steps *K*, *L*, *M*, *N*, *O* will be finished.

At equal distances with that between the lines marked *8* and *14*, draw the parallel lines above marked *9 10*, *11 12* and *13*; and draw perpendicular lines upwards from the points *n*, *o*, *p*, *q*, *r*, *s*, as in the figure.

Make *H m* equal to the intended breadth of the flat above the square opening at the left hand, and draw *HW* toward the point of sight *S*, equal to the intended length of the flat; then draw *WP* parallel to *H m*, and the outlines of the flat will be finished.

Take the width of the opening at pleasure, as from *F* to *C*, and draw *CD* equal and parallel to *FE*. Draw *GH* parallel to *CD*, and the short lines marked *33 34*, &c. just even with the parallel lines *1 2*, &c. From the points where these short lines meet *CD* draw lines toward the point of sight *S* till they meet *DE*; then from the points where the lines *33 39*, *40*, &c. of the pavement meet *C y*, draw upright lines parallel to *CD*, and the lines which form the opening will be finished.

The steps *P*, *Q*, *R*, *S*, *T*, and the flat *U* above

PERSPECTIVE.

the arch V, are done in the same manner with those in fig. 2. as taught in prob. 16. and the equidistant parallel lines marked 18, 19, &c. are directly even with those on the left hand side of the arch V, and the upright lines on the right-hand side are equidistant with those on the left.

From the points where the lines 18, 19, 20, &c. meet the right-hand side of the arch, draw lines toward the point of sight S; and from the points where the pavement lines 29, 30, 31, 32, meet the line drawn from A towards the point of sight, draw upright lines toward the top of the arch.

Having done the top of the arch, as in the figure, and the few steps to the right hand thereof, shade the whole as in fig. 5. and the work will be finished.

By drawing these examples frequently over, to a large scale, and reflecting upon them with attention, the student will become familiar with their use; and as they include the cases which most frequently occur, he will necessarily find great benefit from the knowledge of them.

The practical part of perspective is only the application of these rules to the actual description of objects. But as this part is purely mathematical, its assistance towards drawing is alone what can be performed by rule and compass, and can therefore strictly serve only for finding the images of points, of which they are composed; and, as these are infinite, it is endless to find them all by the strict rules; whence it becomes necessary after a sufficient number of them are found, to complete the image by the help of drawing, to the better effecting of which these points serve as a guide. Thus, when a circle is to be described, the practical rules serve to find a sufficient number of points in the circumference; which, being neatly joined by hand, will perfect the image, so that, in strictness, nothing in this image is found by mathematical rules, save the few particular points; the rest owes its being to the hand of the drawer.

Thus, also, if any complicated figure is proposed, it may not be easy to apply the practical rules to the description of every minute part: but by inclosing that figure in a regular one, properly subdivided and reduced into perspective, that will serve as a help, whereby a person skilled in drawing may with ease describe the object proposed. Upon the whole, where the boundaries of the proposed objects consist of straight lines and plane surfaces, they may be described directly by the rules of perspective; but when they are curvilinear, either in their sides or surfaces, the practical rules can only serve for the description of such right-lined cases as may conveniently inclose the objects, and which will enable the designer to draw them within those known bounds with a sufficient degree of exactness.

It is therefore in vain to seek, by the practical rules of perspective, to describe all the little hollows and prominences of objects, the different light and shades of their parts, or their smaller windings and turnings; the infinite variety of the folds in drapery; of the boughs and leaves of trees, or the features and limbs of men and animals; much less to give them that roundness and softness, that force and spirit, that easiness and freedom of posture, that expression and grace, which are requisite to a good picture. Perspective must content itself with its peculiar province of exhibiting a kind of rough draught to serve as a ground-work, and to ascertain the general proportions and places of the objects, according to their supposed situations; leaving the rest to be finished, beautified, and ornamented, by a hand skilful in drawing,

It is true, perspective is of most use where it is most wanted, and where a deviation from its rules would be the most observable; as in describing all regular figures, pieces of architecture, and other objects of that sort, where the particular tendency of the several lines is most remarkable; the rule and compass in such cases being much more exact than any description made by hand: but still the figure, described by the perspective rules, will need many helps from drawing; the capitals, and other ornaments of pillars, and their entablatures, the strength of light and shade, the apparent roundness and protuberance of the several parts, must owe their beauty and finishing to the designer's hand; but with regard to such objects as have no constant and certain determinate shape or size, such as clouds, hills, trees, rivers, uneven grounds, and the like, there is a much larger latitude allowable, provided the general bulk, or usual natural shape of those objects, are in some measure observed, so as not to make them appear unnatural or monstrous. See DRAWING.

But although the strict practical rules of perspective are in a great measure confined to the description of right-lined figures, yet the knowledge of the general laws of that science is of great and necessary use to inform the judgment, after what manner the images of any proposed lines should run, which way they should tend, and where terminate; and thereby enables it the better to determine what appearance any objects ought to put on, according to their different situations and distances; it accustoms the eye to judge with greater certainty of the relations between real objects and their perspective descriptions, and directs the hand to draw the same accordingly; and directs the judgment readily to discover any considerable error therein which might otherwise escape notice. Besides that, when the ground, or general plan, and the principal parts of a picture, are first laid down according to the rules, every thing else will more naturally fall in with them, and every remarkable deviation from the just rules will be the more readily perceived, and the easier avoided or rectified; so that although it may be infinitely tedious, or absolutely impracticable, to describe every minute part of a picture by the strict mechanical rules, yet the employing them, where they can be the most commodiously used, will give the picture in general such a look, as will guide the artist in drawing the other parts without any obvious inconsistency.

When a painter has formed a scene in his mind, and supposed, as it is customary, that the capital figures of this scene lie close, or almost close, to the back of his canvass, he is, in the next place, to fix upon some point on this side of the canvass, from which he would choose his piece should be seen. But in choosing this point, which is called the point of sight, regard should be had to its situation to the right or left of the middle of the canvass: but, above all things, to its distance and its height with respect to the lower edge of the canvass; which edge is called the base-line, and is parallel with the horizontal line that passes through the eye. For by assuming the point of sight, and consequently the horizontal line, too low, the planes upon which the figures stand will appear a great deal too shallow; as, by assuming it too high, they will appear too steep, so as to render the piece far less light and airy than it ought to be. In like manner, if the point of sight is taken at too great a distance from the canvass, the figures will not admit of degradation enough to be seen with suffi-

Muslow & Co. Pat. 1812.

PERSPECTIVE.

cient distinctness; and if taken too near it, the degradation will be too quick and precipitate to have an agreeable effect. Thus, then, it appears, that no small attention is requisite in the choice of this point.

When a picture is to be placed on high, the point of sight should be assumed low, and *vice versa*; in order that the horizontal line of the picture may be, as near as possible, in the same horizontal plane with that of the spectator; for this disposition has an amazing effect. When a picture is to be placed very high, as, amongst many others, that of the Purification by Paolo Veronese, engraved by Le Fevre, it will be proper to assume the point of sight so low, that it may lay quite under the picture, no part of whose ground is, in that case, to be visible; for, were the point of sight to be taken above the picture, the horizontal ground of it would appear sloping to the eye, and both figures and buildings as ready to tumble head foremost. It is true, indeed, that there is seldom any necessity for such extraordinary exactness; and that unless in some particular cases, the point of sight had better be rather high than low: the reason of which is, that, as we are more accustomed to behold people on the same plane with ourselves, than either higher or lower, the figures of a piece must strike us most when standing on a plane nearly level with that upon which we ourselves stand. To this it may be added, that by placing the eye low, and greatly shortening the plane, the heels of the back figures will seem to bear against the heads of the foremost, so as to render the distance between them far less perceptible than otherwise it would be.

The point of sight being fixed upon according to the situation in which the picture is to be placed, the point of distance is next to be determined. In doing this, a painter should carefully attend to three things: first, that the spectator may be able to take in, at one glance, the whole and every part of the composition; secondly, that he may see it distinctly; and thirdly, that the degradation of the figures and other objects of the picture be sufficiently sensible.

But there is a particular still remaining, which will not admit of the least latitude. This is the delineation of the picture, when once the point of sight has been fixed upon. The figures of a picture are to be considered as so many columns erected on different spots of the same plane; and the painter must not think of designing any thing, till he has laid down, in perspective, all those columns which are to enter his composition, with the most scrupulous exactness. By proceeding in this manner, he may not only be sure of not committing any mistake in the diminution of his figures according to their different distances, but may flatter himself with the thoughts of treading in the steps of the greatest masters. It is to the punctual observance of these laws that we are to attribute the grand effect of some paintings by Carpa-zio and Mantegna, so careless in other respects; whereas a single fault against them is often sufficient entirely to spoil the works of a Guido, in spite of the sublimity and beauty of his superior style.

PERSPECTIVE (Aerial), is the art of giving a due diminution or degradation to the strength of the light, shade, and colours of objects, according to their different distances, the quantity of light which falls on them, and the medium through which they are seen.

As the eye does not judge of the distance of objects entirely by their apparent size, but also by

their strength of colours, and distinction of parts; so it is not sufficient to give an object its due apparent bulk according to the rules of stereography unless at the same time it be expressed with that proper faintness and degradation of colour which the distance requires. Thus if the figure of a man, at a distance, were painted of a proper magnitude for the place, but with too great a distinction of parts, or too strong colours, it would appear to stand forward, and seem proportionally less, so as to represent a dwarf situated nearer the eye, and out of the plane on which the painter intended it should stand.

By the original colour of an object is meant that colour which it exhibits to the eye when duly exposed to it in a full open uniform light, at such a moderate distance as to be clearly and distinctly seen. This colour receives an alteration from many causes, the principal of which are the following.

1. From the objects being removed to a greater distance from the eye, whereby the rays of light which it reflects are less vivid, and the colour becomes more diluted and tinged, in some measure, by the faint bluish cast, or with the dimness or haziness of the body of air through which the rays pass.

2. From the greater or less degree of light with which the object is enlightened; the same original colour having a different appearance in the shades, from what it has in the light, although at an equal distance from the eye, and so in proportion to the strength of the light or shade.

3. From the colour of the light itself which falls upon it, whether it be from the reflection of coloured light from any adjacent object, or by its passage through a coloured medium, which will exhibit a colour compounded of the original colour of the object, and the other accidental colours which the light brings with it.

4. From the position of the surface of the object, or of its several parts with respect to the eye; such parts of it appearing more lively and distinct than those which are seen obliquely.

5. From the closeness or openness of the place where the object is situated; the light being much more variously directed and reflected within a room than in the open air.

6. Some original colours naturally reflect light in a greater proportion than others, though equally exposed to the same degrees of it; whereby their degradation at several distances will be different from that of other colours which reflect less light.

PERSPECTIVE MACHINES, or contrivances for designing or drawing in perspective, are of various kinds. We shall here describe three or four of the most useful. See also CAMERA OBSCURA and LUCIDA.

Provide a square piece of glass fitted into a frame ABDC (fig. 1, pl. 137); and wash and smear it over with water in which a little gum has been dissolved. When it is well dried again, turn it towards the object or objects to be designed, so that the whole may be seen through a dioptra or sight, GH. Then applying the eye to the sight, with a pen and ink draw every thing on the glass, as you see it appear thereon: or the outlines of the objects may be drawn with black colour in drying oil. Having finished the draught, lay a fair moist paper thereon; and, pressing it pretty tight down, the whole will be transferred from the glass to the paper. This method is very good, easy, and exact, and deserves to be more used by painters. Some have used a piece of tiffany or fine lawn; and others, paper made transparent by means of oil of

PERSPIRATION.

the shape of very little drops adhering to the epidermis. The secretory organ is composed of the extremities of the cutaneous arteries. The smell of the perspirable fluid, in an healthy man, is fatuous and animal; its taste manifestly salt and ammoniacal. In consistence it is vaporous and aqueous; and its specific gravity is greater than water. For the most part it is yellowish, from the passage of the subcutaneous oil, and sebaceous matter of the subcutaneous glands. Sometimes it is reddish, from the globules of the cruor passing through, especially under the axillæ. The quantity is sometimes so profuse, as not only conspicuously to moisten the linen, but also the thicker garments. The cutaneous arteries from which the perspirable matter is secreted are easily shown by injecting water or isinglas into the arteries; for then, from all parts of the skin, an infinite number of small drops exude, which being effused under the cuticle, rendered impervious by death, raise it up in blisters.

During life, this exhalation is demonstrated in many ways. A bright mirror, when held near the warm and naked skin, is quickly obscured by a moist vapour. In subterraneous caverns, where the air is denser, it most evidently escapes in the air, from the whole surface of the body, in the form of visible and thick clouds.

In man, and in some, though not in all animals, whenever the motion of the blood is increased, while at the same time the skin is hot and relaxed, from the small cutaneous pores, instead of an invisible vapour, sweat exudes in the form of minute, but visible drops, which, with others of the same kind, run together into larger drops. The hottest parts are most subject to sweat, as the head, breast, and folds of the body. The experiment before mentioned, together with the simplicity of nature, the visible density of the cutaneous and pulmonary exhalation, persuades us, that sweat is discharged through the same vessels which are the organs of perspiration, and that it differs only in its quantity and celerity, and by the admixture of the liquor of the sebaceous glands, and the subcutaneous oil, which being diluted by the more plentifully secreted arterial fluid, exude of an oily and yellow consistence, and chiefly cause the smell and colour of the sweat. Hence, it is more fetid and yellower in the armpits and groins, where those glands are most numerous. Both blood and small sand have escaped from the skin along with the sweat.

The nature of perspiration must be investigated by experiments, and by its analogy with the pulmonary exhalation, which, in like manner, but more frequently, becomes visible in a cold air. That this exhalation is chiefly water, has been proved by experiments, in which the breath, being received into large vessels, has condensed into watery drops. This is confirmed by the tenuity of the cloud on the mirror, and its volatility, and by the familiar change of the perspired matter, when obstructed, into a diuresis or diarrhœa, and from the easy determination of warm liquors to assume the

form of perspiration by heat, or of urine by cold. This water is derived from our drink, which furnishes a great part of the perspiration, and from inhalation. Frequently, even the odours of our aliments may be plainly perceived in the perspiration; there is also an admixture of the electrical matter in every person, and in some it is evidently lucid.

That it also contains some volatile particles of an alkaline nature is evident, both from the nature of our blood, and from the considerable evils which succeed the retention of the perspiration, most conspicuously in acute diseases, when, by being repelled inward, it renders the urine pale, and from the corruption of the air by respiration. This volatile alkaline matter arises from the particles of the blood, attenuated by perpetual heat and trituration, and changed into an acrimonious nature. Dogs trace these odours, and could not know their masters unless something of a particular nature were perspired from each person.

The quantity of matter perspired is very large, whether we consider the extent of the organ secreting it, the quantity of vapour exhaled by the lungs alone, or the experiments of Sanctorius, by which it would seem, that of eight pounds of food and drink, five pounds, or according to other experiments in a colder country, from fifty-six to thirty ounces are perspired, which neither add to the weight of the body, nor escape by any visible excretion except the saliva, sweat, and mucus of the nose. But the cutaneous exhalation is even much larger than this; since it not only throws off such a proportion of the alimentary matters, but likewise redischarges what the blood requires by inhalation. In this, however, the different states of the air, and of the body, have great influence. In warm countries, in the summer-months, and in young active persons, more goes off by perspiration, and less by the urine. But in cold climates, during the temperate and winter seasons, in aged or inactive persons, more goes off by the urine than by the insensible perspiration. In temperate countries, making a computation throughout the whole year, something more is perspired than what passes off by urine; and, by collating all the experiments made in different countries, both excretions are almost alike. It is also somewhat affected by the difference of time after eating; and the law which seems to obtain, is, that the perspiration is most copious at that time when the alimentary matters, being mostly digested, and received into the blood, are fitted for exhalation. It is naturally diminished during sleep, even in the warmest climates; but it is increased by the heat of the bed-clothes.

In general a plentiful and equable perspiration, at the same time that the body is strong, are good signs of health; for excessive perspiration, when conjoined with debility, is observed to do more mischief than its entire suppression, if what has been written on this subject is sufficiently to be depended on. It is a sign of health, because it denotes the perviousness of the vessels dispersed throughout

PERSPIRATION.

the whole body, and the complete digestion of the aliments, of which a great part is resolved into halitus. When it is diminished, it indicates constriction of the skin, weakness of the heart, and imperfect digestion. When excessive, it perhaps wastes the nervous spirits. This discharge is, by moderate exercise, increased to six times that of a person at rest, to the extent of a pound in an hour, or even in half an hour. It is farther increased, if aided by strong and open vessels, by warm, watery, and cordial drinks, by food of easy digestion, by a dense and temperate atmosphere, and by cheerfulness. It is diminished or suppressed by the contrary causes; as a dense skin, a moist, or a cold and dry atmosphere, rest, an increased flow of urine, the supervention of a diarrhoea; and lastly, nervous agitation, from a disagreeable affection of the mind. However, the continuance of life does not depend so intimately on this discharge which is so easily, and without bad consequences, increased or diminished by slight causes; and is so inconsiderable, in many nations, anointing their skins with oil, and in many animals. When by being suppressed, it produces such bad effects in fevers of a bad kind, it hurts chiefly by the putrescent particles, which are retained by the perspiration being suppressed.

The sweat is evidently of a saline nature; as appears both from its taste and from the crystals which form upon the clothes of glass-blowers; and by distillation, which demonstrates its alkaline nature. Hence, by this discharge, the miasms of the most pestilential diseases are frequently expelled. But, in reality, sweat is always a preternatural discharge, and ought never to exist in a healthy person, unless by violent bodily exercise he have induced a temporary disease. It also is frequently injurious in acute diseases; by wasting the water of the blood, so that the rest becomes thicker, and the salts more acrimonious. By violent exercise, or the heat of the climate, the sweat is extremely fetid; and even sanguineous: being electrical, it sometimes is lucid.

The uses of perspiration are, to free the blood of its redundant water, of its alkaline impurities, rendered more acrid by repeated circulations; and of an extremely volatile oil, probably prepared from the same blood. The same perspiration likewise qualifies and softens the cuticle, and preserves the necessary softness of the papillæ.

But the same skin, which has vessels exhaling into the air, is likewise replenished with vessels, which absorb thin vapours from the air, either perpetually, or at least in a moderate degree of cold; in a moist atmosphere; in the night-time, when the body is at rest, the mind depressed, and under circumstances, contrary to those mentioned above, which increase perspiration. These veins are demonstrated by anatomical injections, which, if thin or watery, exude through them in the same manner as through the arteries: moreover, by the manifest operations of medicines, diffused in the air, or applied to the skin: of vapours, mercury, turpentine, saffron; of baths, mercurial plas-

ters, tobacco, coloquintida, opium, cantharides; arsenic; by the fatal effects of poisons, absorbed by the skin; as the venereal poison; by the living of animals, without drink, in hot but humid islands; by the perspiration and urine being sufficiently copious in such situations, without much drink; and lastly, by extraordinary morbid cases, in which the quantity of urine discharged has far exceeded the drink taken in; in which it is probable, that the inhaling pores were more open; for that new ones were generated, is not credible. It is difficult to ascertain its quantity; that it is very great in plants in the night-time, is proved by certain experiments.

Both the exhaling and inhaling vessels may be contracted and relaxed by the nervous power. This appears from the effects of the passions of the mind; which, if lively and exhilarating, relax the exhaling vessels, by increasing the impulse of the influx of blood; and by the remission of the nerves; hence redness, moisture, and turgescence of the skin. Those passions which are languid and depressing contract the exhaling vessels; as appears from the dryness of the skin, produced by them; from the goose-skin, by terror; and from diarrhoea, caused by fear. They also seem to dilate the inhaling vessels, whence fear facilitates the action of the small-pox and the plague.

The constituent principles of the perspirable fluid appear to be, 1. Water, attenuated into vapour, by the matter of heat. 2. Animal gas, or carbonated hydrogen. As the production of carbonated air with the oxygen of the atmosphere shews. 3. Azotic gas. For water in which a man has bathed soon becomes putrid. Carbonated hydrogen, chemically combined with azot, would appear to constitute putrid miasm. May not this be the origin of putrid fever, in those narrow confined chambers in which there are many persons? 4. The glandular smegma and subcutaneous oil; hence linen is stained with a yellowish colour, and leanness is brought on. 5. The serum of the blood. This affords an immense quantity of water, and the albuminous and saline part of the sweat. It makes the linen of a viscid rigidity, and of a salt taste. Glass-blowers sometimes excrete so acrid a sweat, that salt has been seen collected in crystals on their faces.

Perspiration varies in respect to, 1. The temperature of the atmosphere. Thus men have a more copious, viscid, and higher coloured sweat on summer days, and in warm countries, than in colder regions. 2. Sex. The sweat of a man is said to smell more acrid than that of a woman. 3. Age. The young are more subject to sweat than the aged, who during the excessive heat of the summer scarcely sweat at all. 4. Ingesta. An alliacious sweat is perceived from eating garlic; a leguminous from peas; an acid from acids; a fetid from animal food only; and a rancid sweat from fat foods, as is observed in Greenland. A long abstinence from drink causes a more acrid and coloured sweat; and the drinking a great quantity of cold water in summer, a limpid and thin sweat. 5. Medicines. The sweat of those

who have taken musk, even moderately, and assafoetida, or sulphur, smells of their respective natures. 6. Region of the body. The sweat of the head is greasy; on the forehead it is more aqueous; under the axillæ very unguinous; and in the interstices of the toes it is very fetid, forming in the most healthy man blackish sordes. 7. Diseases. In this respect it varies very much, in regard to quantity, smell, and colour; for the sweat of gouty persons is said to turn vegetable juices to a red colour, and is of a cretaceous nature. Some men also have a lucid sweat, others a sweat tinging their linen of a carulean colour.

The uses of the insensible perspiration are, 1. To liberate the blood from superfluous animal gass, azot, and water. 2. To eliminate the noxious and heterogeneous excrements; hence the acid, rancid, leguminous, or putrid perspiration of some men. 3. To moisten the external surface of the body, lest the epidermis, cutis, and its nervous papillæ be dried up by the atmospheric air. 4. To counter-balance the suppressed pulmonary transpiration of the lungs; for when it is suppressed, the cutaneous is increased: hence the nature of both appears to be the same.

The use of the sensible perspiration or sweat, in an healthy man, is scarcely observable, unless from an error of the six non-naturals. Its first effect on the body is always prejudicial, by exhausting and drying it; although it is sometimes of advantage. 1. By supplying a watery excretion: thus when the urine is deficient, the sweat is often more abundant. In this manner an aqueous diarrhoea is frequently cured by sweating. 2. By eliminating at the same time any morbid matter. Thus various miasms are critically expelled, in acute and chronic diseases, with the sweat.

PERSPIRATIVE. *a.* (from *perspire*.) Performing the act of perspiration.

To PERSPIRE. *v. n.* (*perspiro*, Latin.) 1. To perform excretion by the cuticular pores. 2. To be excreted by the skin (*Arbutnot*).

To PERSTRINGE. *v. a.* (*perstringo*, Lat.) To graze upon; to glance upon.

PERSUADABLE. *a.* (from *persuade*.) Such as may be persuaded.

To PERSUADE. *v. a.* (*persuadeo*, Latin.) 1. To bring to any particular opinion (*Wake*). 2. To influence by argument or expostulation. *Persuasion* seems rather applicable to the passions, and *argument* to the reason; but this is not always observed (*Sidney*). 3. To inculcate by argument or expostulation (*Taylor*). 4. To treat by persuasion: not in use (*Shakspeare*).

PERSUA'DER. *s.* (from *persuade*.) One who influences by persuasion; an importunate adviser (*Bacon*).

PERSUASIBLE. *a.* (*persuasibilis*, Lat.) To be influenced by persuasion (*Gov. of the Tongue*).

PERSUA'SIBLENESS. *s.* (from *persuasible*.) The quality of being flexible by persuasion.

PERSUA'SION. *s.* (*persuasion*, French; from *persuasus*, Latin.) 1. The act of persuading; the act of influencing by expostulation;

the act of gaining or attempting the passions (*Olway*). 2. The state of being persuaded; opinion.

PERSUA'SIVE. *a.* (*persuasif*, French; from *persuade*.) Having the power of persuading; having influence on the passions (*Hooker*).

PERSUA'SIVELY. *ad.* (from *persuasive*.) In such a manner as to persuade (*Milton*).

PERSUA'SIVENESS. *s.* (from *persuasive*.) Influence on the passions (*Hammond*).

PERSUA'SORY. *a.* (*persuasorius*, Latin.) Having the power to persuade (*Brown*).

PERT. *a.* (*pert*, Welsh.) 1. Lively; brisk; smart (*Milton*). 2. Saucy; petulant; with bold and garrulous loquacity (*Collier*).

To PERTAIN. *v. n.* (*pertineo*, Latin.) To belong; to relate (*Peacham*).

PERTEREBRATION. *s.* (*per* and *terebatio*, Lat.) The act of boring through (*Ainsworth*).

PERTH, the capital of Perthshire, with two churches, one of which belonged formerly to a fine abbey. It has been the residence of the sovereigns of Scotland, and the seat of the parliament and of the supreme courts of justice. The tide comes up to this place, and the river is navigable for small vessels. Here is a great linen and cotton manufacture. In 1801 the inhabitants amounted to 14,878. Perth is seated on the Tay, over which is a bridge, 30 miles N. of Edinburgh. Lon. 3. 27 W. Lat. 56. 22 N.

PERTSHIRE, a county of Scotland, bounded on the N. by the shires of Inverness and Aberdeen; on the E. by Angusshire and the frith of Tay; on the S. by the counties of Fife, Kinross, Clackmannan, and Stirling; and on the W. by Argyleshire. It extends 60 miles from E. to W. and nearly the same from N. to S. The northern district, called Athol, is mountainous, and contains some lakes. This county contains about 4,068,640 acres; and in 1801 had 126,366 inhabitants.

PERTH AMBOY, a seaport of the United States, in New Jersey, seated on a neck of land, between the river Raritan and Arthur Kull Sound. It lies open to Sandy Hook, and is one of the best harbours on the continent. It is 25 miles S.W. of New York. Lon. 75. 0 W. Lat. 40. 35 N.

PERTINA'CIOUS. *a.* (from *pertinax*, Lat.) 1. Obstinate; stubborn; perversely resolute (*Walton*). 2. Resolute; constant; steady (*South*).

PERTINA'CIOUSLY. *ad.* Obstinate; stubbornly (*King Charles*).

PERTINA'CITY. PERTINA'CIOUSNESS. *s.* (*pertinacia*, Latin; from *pertinacious*.) 1. Obstnacy; stubbornness (*Brown*). 2. Resolution; constancy.

PERTINACY. *s.* (from *pertinax*, Latin.) 1. Obstnacy; stubbornness; persistency. 2. Resolution; steadiness; constancy (*Taylor*).

PERTINAX (Publius Helvius), a Roman emperor after the death of Commodus. He was descended of an obscure family, and for some time followed the mean employment of making charcoal. Though indigent, he re-

PER

ceived a liberal education, and he, for some time, taught the Greek and Roman language in Etruria. He left this profession for a military life, and by his valour gradually rose to the highest offices in the army, and was made consul by M. Aurelius, for his eminent services. He was afterwards entrusted with the government of Moesia, and at last he presided over the city of Rome as governor. When Commodus was murdered, Pertinax was universally selected to succeed him. He acquiesced with reluctance, but his mildness and economy convinced the senate and the people of the prudence of their choice. After having made many salutary regulations in the state, and gained the affection of the worthiest and most discerning of his subjects, the extravagant and luxurious alone raised clamours against him, and when Pertinax attempted to introduce among the pretorian guards that discipline which was necessary to preserve the tranquillity of Rome, the minds of the soldiers became totally alienated. Pertinax was apprized of this mutiny, but he refused to fly at the hour of danger, and he scorned the advice of his friends who wished him to withdraw from the impending storm. He was assassinated by his soldiers, and his head was cut off and carried upon the point of a spear, as in triumph, to the camp. This happened on the 28th of March, A. D. 193. Pertinax reigned only 87 days, and by his death the Roman empire was robbed of a wise, virtuous, and benevolent emperor.

PERTINENCE. *PERTINENCY.* *s.* (from *pertineo*, Latin.) Justness of relation to the matter in hand; propriety to the purpose; appositiveness (*Bentley*).

PERTINENT. *a.* (*pertinens*, Lat. *pertinent*, Fr.) 1. Related to the matter in hand; just to the purpose; not useless to the end proposed; apposite (*Bacon*). 2. Relating; regarding; concerning (*Hooker*).

PERTINENTLY. *ad.* (from *pertinent*.) Appositely; to the purpose (*Taylor*).

PERTINENTNESS. *s.* Appositiveness.

PERTINGENT. *a.* (*pertingens*, Latin.) Reaching to; touching.

PERTLY. *ad.* (from *pert*.) 1. Briskly; smartly (*Pope*). 2. Saucily; petulantly (*Swift*).

PERTNESS. *s.* (from *pert*.) 1. Brisk folly; sauciness; petulance (*Pope*). 2. Petty liveliness; spiritlessness without force, dignity, or solidity (*Watts*).

PERTRANSIENT. *a.* (*pertransiens*, Lat.) Passing over.

To PERTURB. To PERTURBATE. *v. a.* (*perturbo*, Lat.) 1. To disquiet; to disturb; to deprive of tranquillity (*Sandys*). 2. To disorder; to confuse; to put out of regularity (*Brown*).

PERTURBATION. *s.* (*perturbatio*, Lat.) 1. Disquiet of mind; deprivation of tranquillity (*Ray*). 2. Restlessness of passions (*Bacon*). 3. Disturbance; disorder; confusion; commotion (*Bacon*). 4. Cause of disquiet (*Shakspeare*). 5. Commotion of passions (*Ben Jonson*).

PER

PERTURBATOIR. *s.* (*perturbator*, Lat.) Raiser of commotions.

PERTUIS, a town of France, in the department of the Mouths of the Rhone, 10 miles N. of Aix and 27 of Marseilles. Lon. 5. 36 E. Lat. 43. 44 N.

PERTUSED. *a.* (*pertusus*, Lat.) Bored; punched; pierced with holes.

PERTUSION. *s.* (from *pertusus*, Latin.)

1. The act of piercing or punching (*Arbuth.*).
2. Hole made by punching or piercing (*Bac.*).

PERTUSSIS. (from *per*, much, and *tussis*, cough.) The whooping cough. A genus of disease in the class neuroses, and order spasmi of Cullen, known by a convulsive strangulating cough, with whooping, relieved by vomiting, and being contagious.

PERU, a large country of S. America, bounded on the N. by Popayan, on the W. by the Pacific Ocean, on the S. by Chili, and on the E. by the Andes. It is 1500 miles from N. to S. and 125 from E. to W. but in some places it is much broader. It never rains in the south parts; but in the north, where the mountains are not so high, it often rains excessively. There are large forests on the sides of the mountains which advance near the sea; but none of the trees are like those in Europe. Peru has been long celebrated for its mines of gold and silver, which are the chief or only source of its riches. Notwithstanding the little industry which is employed in working them, and the small help that commerce affords to the miners, 534,000 marks of silver, and 6,038 of gold, were smelted and refined in the royal mint at Lima, in 1790; and 5,162,239 piastres, in both materials, were coined there. Beside the produce of the mines, the commodities exported are sugar, Vienna wood, cotton, Peruvian bark, copper, and cocoa. The fiercest beasts of prey in Peru are the puma and jaguar, inaccurately called lions and tigers by the Europeans, but possessing neither the undaunted courage of the former, nor the ravenous cruelty of the latter: they are hardly formidable to man, and often turn their backs on the least appearance of resistance. A quadruped called the lama, peculiar to this country, was tamed to domestic purposes by the ancient Peruvians. In form it bears some resemblance to a deer, and some to a camel, and is of a size somewhat larger than a sheep. Its wool furnished the Peruvians with clothing, its flesh with food. It was even employed as a beast of burden, and carried a moderate load with much patience and docility; but it was never used for draught. Among the birds, the most remarkable is the condor, which is entitled to preeminence over the flying tribe, in bulk, strength, and courage. The river Guyaquil abounds with alligators, and the neighbouring country swarms almost as much with snakes and vipers as that round Porto Bello does with toads. When the Spaniards landed in this country, in 1530, they found it governed by sovereigns called Incas, who were revered by their subjects as divinities; and the inhabitants were found to be much more polished than

the natives of other parts of America, those of Mexico excepted. These were soon subdued by a few Spaniards, under the command of Francis Pizarro. Peru is inhabited by the Spaniards, the native Americans, and a mixture arising from both, called Mestics. The native Americans, who live among the forests, form, as it were, so many small republics, which are directed by a Spanish priest, and by their governor, assisted by the original natives, who serve as officers. They have no distrust, for they leave the doors of their huts always open, though they have cotton, calabashes, and a sort of aloes, of which they make thread, and several other small matters that they trade with, which might be easily stolen. They go naked, and paint their bodies with a red drug, called rocu. The same man is of all trades, for he builds his own hut, constructs his own canoe, and weaves his own cloth; but if a large house is to be built for common use, every one lends a helping hand. Their skin is of a red copper colour; and they have no beard nor hair on any part of their bodies except their heads, where it is black, long, and coarse. Those that are not much exposed to the weather are of a lighter colour than the rest. The natives who live at Quito seem to be of a different temper; for they are extremely idle, and so stupid, that they will sit whole days together upon their heels, without stirring or speaking. Their garment is a sort of a sack, with holes to put their arms through; and this is given them by their masters as part of their wages. The Mestics, though illegitimate, have all the privileges of a Spaniard, and are the persons who carry on all trades; for the Spaniards think it beneath them to meddle with any thing of this sort: they behave in a more tyrannical manner over the real Americans, than even the Spaniards themselves, inasmuch that the governor is obliged to repress their insolence. Peru is now divided into three great audiences, which are Quito, Lima or Los Reyes, and Los Charcos; the whole under the government of a viceroy, whose authority once extended over all S. America, possessed by the Spaniards: but as some of the countries in this vast jurisdiction are above 2000 miles distant from the supreme seat of justice at Lima, the inhabitants were subject to the greatest inconveniences; to remedy which, two new viceroyalties have been established. The first is fixed at St. Fé de Bogota, the capital of the new kingdom of Granada, and extends over the whole of Terma Firma, and the audience of Quito. In the jurisdiction of the second, established in 1776, are the provinces of Plata, Buenos Ayres, Paraguay, Tucuman, Potosi, St. Cruz de la Sierra, and the towns of Mendoza and St. Juan. Lima is the capital. See *ANDES*.

PERU (Balsam of). See *MYROXYLON*.

To *PERVADE*. *v. a.* (*pervado*, Lat.) 1. To pass through an aperture; to permeate (*Black*). 2. To pass through the whole extension.

PERVA'SION. *s.* (from *pervade*.) The act of pervading or passing through (*Boyle*).

PERVERSE. *a.* (*pervers*, Fr. *perversus*, Latin.) 1. Distorted from the right (*Milton*). 2. Obstinate in the wrong; stubborn; untractable (*Dryden*). 3. Petulant; vexatious; peevish; desirous to cross and vex; cross (*Shakspeare*).

PERVERSELY. *ad.* With intent to vex; peevishly; vexatiously; spitefully; crossly; with petty malignity (*Decay of Piety*).

PERVERSENESS. *s.* (from *perverse*.) 1. Petulance; peevishness; spiteful crossness (*Donne*). 2. Perversion; corruption: not in use (*Bacon*).

PERVERSION. *s.* (*perversion*, Fr.) The act of perverting; change to worse (*Swift*).

PERVERSITY. *s.* (*perversité*, Fr.) Perverseness; crossness (*Norris*).

To *PERVERT*. *v. a.* (*perverto*, Latin.) 1. To distort from the true end or purpose (*Milton*). 2. To corrupt; to turn from the right (*Milton*).

PERVERTER. *s.* (from *pervert*.) 1. One that changes any thing from good to bad; a corrupter (*South*). 2. One who distorts any thing from the right purpose (*Stillingfleet*).

PERVERTIBLE. *a.* (from *pervert*.) That may be easily perverted (*Ainsworth*).

PERUGIA, an ancient and populous city of Italy, capital of Perugino, with a strong citadel, a university, and a bishop's see. The churches, and many other buildings, public and private, are very handsome. It is seated on a hill, 75 miles N. of Rome. Lon. 12. 20 E. Lat. 43. 6 N.

PERUGIA, a lake of Italy, eight miles from the city of that name, in the province of Perugino. It is almost round, five miles in diameter, and in it are three islands.

PERUGINO, a province of Italy, in the Ecclesiastical State, bounded on the W. by Tuscany, on the S. by Orvietano, on the W. by the duchies of Spoleto and Urbino, and on the N. by the county of Citta Castellana. It is 25 miles in length, and near as much in breadth. The air is pure, and the soil fertile in corn and good wine. The capital is Perugia.

PERVICA'CIOUS. *a.* (*pervicax*, Latin.) Spitefully obstinate; peevishly contumacious (*Clarendon*).

PERVICA'CIOUSLY. *ad.* (from *pervicacious*.) With spiteful obstinacy.

PERVICA'CIOUSNESS, *PERVICA'CITY*. *PERVICA'CY*. *s.* (*pervicacia*, Latin; from *pervicacious*.) Spiteful obstinacy.

PERVIOUS. *a.* (*pervius*, Latin.) 1. Admitting passage; capable of being permeated (*Taylor*). 2. Pervading; permeating: not proper (*Prior*).

PERVIOUSNESS. *s.* (from *pervius*.) Quality of admitting a passage (*Boyle*).

PERUKE. *s.* (*peruque*, French.) A cap of false hair; a periwig (*Wiseman*).

To *PERUKE*. *v. a.* (from the noun.) To dress in adscitious hair.

PERUKEMAKER. *s.* (*peruke* and *maker*.) A maker of perukes; a wigmaker.

PERULA, in botany, a genus of the class dioecia, order polyandria. Calyx two-leaved, corol one-petalled. Male: germs four, barren, on short pedicels. Female: styles one to each germ; capsule pedicelled, drooping, three-celled, three-valved; seeds solitary. One species only. A New Grenada shrub.

PERUSAL. *s.* (from *peruse*.) The act of reading (*Atterbury*).

To **PERUSE**. *v. a.* (*per* and *use*.) 1. To read (*Bacon*). 2. To observe; to examine (*Shakspeare*).

PERUSER. *s.* (from *peruse*.) A reader; examiner (*Woodward*).

PERUVIAN MASTIC TREE. See **SCHINUS**.

PERUVIAN BARK. See **CINCHONA**.

PERUVIANUS CORTEX. Peruvian bark. See **CINCHONA**.

PERUVIANUS CORTEX FLAVUS. See **CINCHONA**.

PERUVIANUS CORTEX RUBER. See **CINCHONA**.

PES ALEXANDRINUS. See **PYRETHRUM**.

PES CATI. See **GNAPHALUM**.

PES COLUMBINUS. See **GERANIUM COLUMBINUM**.

PES LEONIS. The ladies mantle is sometimes so called. See **ALCHEMILLA**.

PESARO, a fortified seaport of Italy, in the duchy of Urbino, and a bishop's see. The cathedral is magnificent, and it has handsome churches, convents, and palaces, with exquisite paintings. The environs are remarkable for producing olives, and excellent figs. It is seated on an eminence, at the mouth of the Foglia, on the gulf of Venice, 17 miles E.N.E. of Urbino. Lon. 13. 2 E. Lat. 43. 52 N.

PESCARA, a strong town of Naples, in Abruzzo Citeriore. It was taken by the French in 1798, and stands at the mouth of a river of the same name, on the gulf of Venice, 10 miles N.N.E. of Civita di Chieti.

PESCHIERA, a strong town of Italy, in the Veronese. It was taken by the French in 1796; and the garrison surrendered to the Austrians in 1799. It is seated on the river Mincio, where it proceeds from the lake Garda, 16 miles W. of Verona.

PESCIA, a town of Tuscany, celebrated for its fine oil, 27 miles W. by N. of Florence.

PESSARY. (from *πῆσσω*, to soften.) An instrument that is introduced into the vagina to support the uterus.

PEST, a town of Hungary, capital of a county of the same name, with a fortress, a royal palace, and a university, the only one in the kingdom. Here are many Greek merchants, who conduct the Levant trade to Germany and the northern nations. It is seated on the E. side of the Danube, opposite Buda, 96 miles E.S.E. of Presburg. Lon. 19. 3 E. Lat. 47. 30 N.

PEST. *s.* (*peste*, Fr. *pestis*, Lat.) 1. Plague; pestilence (*Pope*). 2. Any thing mischievous or destructive (*Milton*).

To **PESTER**. *v. a.* (*pester*, Fr.) 1. To disturb; to perplex; to harass; to turmoil (*Swift*). 2. To encumber (*Milton*).

PESTERER. *s.* (from *pester*.) One that pesters or disturbs.

PESTEROUS. *a.* (from *pester*.) Encumbering; cumbersome (*Bacon*).

PESTHOUSE. *s.* (from *pest* and *house*.) A hospital for persons infected with the plague.

PESTIFEROUS. *a.* (from *pestifer*, Latin.)

1. Destructive; mischievous (*Shakspeare*).

2. Pestilential; malignant; infectious (*Arb*).

PESTILENCE. *s.* (*pestilence*, Fr. *pestilentialia*, Lat.) Plague; pest; contagious distemper (*Shakspeare*).

PESTILENT. *a.* (*pestilent*, Fr. *pestilens*, Latin.) 1. Producing plagues; malignant (*Bentley*).

2. Mischievous; destructive (*Knolles*).

PESTILENTIAL. *a.* (*pestilential*, Fr.)

1. Partaking of the nature of pestilence; producing pestilence; infectious; contagious (*Woodward*).

2. Mischievous; destructive; pernicious (*South*).

PESTILENTLY. *ad.* (from *pestilent*.) Mischievously; destructively.

PESTILLATION. *s.* (*pestillum*, Lat.) The act of breaking in a mortar (*Brown*).

PESTIS. The plague. A genus of disease in the class pyrexia and order exanthemata of Cullen, characterized by typhus, which is contagious in the extreme, prostration of strength, buboes, and carbuncles, petechiæ, hæmorrhage, and colliquative diarrhoea.

PESTLE. *s.* (*pestillum*, Lat.) An instrument with which any thing is broken in a mortar (*Locke*).

PESTLE OF PORK. *s.* A gammon of bacon.

PET. *s.* (perhaps from *petit*, little.) 1. A slight passion; a slight fit of peevishness (*L'Estrange*). 2. A lamb taken into the house and brought up by hand. See **PEAT**. (*Hanmer*).

PETAGUEL, a province on the N. coast of Brasil, between the provinces of Seara and Rio Grande. It contains mines of silver.

PETAL, in botany. (*πέταλον*, from *πέλω*, to expand.) The Greek word signifies a leaf; but it has been appropriated by Columna, and from him by other modern authors, the flower-leaf. Tegmen floris corollaceum, Philos. Bot. The corollaceous integument of the flower. In flowers of one petal, the corol and petal are the same. In flowers of several petals, the corol is the whole, and the petals are the parts. Or, to speak more accurately, in a monopetalous flower, the petal is the corol, exclusive of the nectary: in a polypetalous flower, it is one of the leaves of which the whole corol is composed.

In the former it consists of the tube and limb. In the latter of the claw and lamina.

PETALIFORM STIGMA. In botany, a petal-shaped stigma: as in iris.

PETALINUM NECTARIUM. A petaline nectary.

PETALOMA, in botany, a genus of the

class decandria, order monogynia. Calyx cup-shaped, five-toothed; petals five, inserted into the calyx; stamens seated on the margin of the calyx; berry one-celled. Two species; tall trees of Guiana and the West Indies.

PETALOUS FLOWER, in botany, a petalled flower, or a flower having petals; in opposition to apetalous, destitute of petals, or having no corol.

PETARD, in war, a kind of engine of metal, somewhat in shape of a high-crowned hat, or truncated cone; serving to break down gates, barricades, draw-bridges, or the like works which are intended to be surprised.

The petard may be considered as a piece of ordnance, very short, narrow at the breech, and wide at the muzzle; made of copper mixed with a little brass; or of lead with tin; usually about 8.5 inches within at the bottom; the diameter at the beginning of the round part is six, and distant from the lower base nine inches: the circular part is described from the point where the perpendicular to the sides meets the middle line or axis; the thickness of metal is 1.6 inches: there is a brim at the bottom that projects the metal by two inches, and is one inch thick, in which are six holes of half an inch diameter, which serve for screws to fasten the petard on a board in a firm manner; there is a cavity within at the bottom, half an inch deep, and as much in height to fix a board, in order to keep the charge in the petard before it is fixed to the board or plank. There are likewise two handles of about three inches from the flat ring, five inches long, $\frac{7}{8}$ thick, and 1.8 from the outside to the metal. Lastly, a hole of an inch diameter is made either at the top, or on the side, to screw in an iron fuse by which the powder is fired, which fuse is filled with a slow composition, in order that when it is lighted, the petardier may have time to retire out of danger. See the section of a petard in fig. 9. pl. 133.

PETASITES. (*πετασίτης*; from *πετασος*, a hat, so named because its leaves are shaped like a hat.) Butterbur. Pestilentwort. *Tussilago petasites* of Linnéus. The roots of this plant are recommended as aperient and alexipharmic, and promise, though now forgotten, to be of considerable activity. They have a strong smell, and a bitterish acrid taste, of the aromatic kind, but not agreeable.

PETAVIUS (Dionysius), or **DENIS PETAVU**, a French jesuit, born at Orleans, 1583. He was at the age of 19 made professor of philosophy at Bourges, and was admitted among the jesuits in 1605. He defended the catholic religion against the protestants, and his criticisms were particularly directed against Scaliger, and even against his friend Casaubon. He died after a life spent in the service of literature, 1652. He was, according to Gassendus, the most consummate scholar the jesuits ever had. As a chronologist he was particularly eminent, and his Latin is elegant and refined. He wrote *De doctrinâ temporum*, 2 vols. fol.—*uranologia*, 3 vols.—*Rationarium temporum*, fol. and Leyden, 2 vols. 8vo. a valuable work

abridged by Le Clerc.—*Dogmata theologica*, 5 vols. fol.—the Psalms translated into Greek verse, 12mo.—*De ecclesiâ hierarchiâ*, folio, besides controversial pamphlets.

PE-TCHE-LI, the principal province of China, bounded on the N. by the great wall and part of Tartary, E. by the Yellow sea, S. by Chang-tong and Honan, and W. by the mountains of Chan-si. It contains nine cities of the first class, which have many others under their jurisdiction. Although Pe-tche-li extends no further than the 42d degree N. yet all its rivers are so much frozen during four months in the year, that waggons with the heaviest loads may safely pass them. The soil is sandy, and produces very little rice; but it abounds with all other kind of grain, and with the greater part of the fruit trees common in Europe. But what renders this province the most considerable is, that the riches of the whole empire are brought hither, the southern provinces furnishing it with every thing they produce, that is most uncommon and delicious. The inhabitants, in general, are reckoned not so polite, nor so apt to learn the sciences, as those of the southern provinces; but they are stronger and more warlike, in which they resemble the people who inhabit the northern provinces. Peking is the capital.

PETCHSTEIN, in mineralogy. See **PITCHSTONE**.

PETECHIÆ. (from the Italian *petechio*, a fleabite, because they resemble the bites of fleas.) Red or purple spots that mostly appear in contagious diseases.

PETER (St.), the apostle, born at Bethsaida, was son of John, Jona, or Joanna, and brother of St. Andrew (John i. 42, 43.). His first name was Simon or Simeon; but when our Saviour called him to the apostleship, he changed his name into Cephas, that is, in Syriac, a stone or a rock; in Latin, *petra*, whence Peter. He was a married man; and had his house, his mother-in-law, and his wife, at Capernaum, upon the lake of Gennesareth (Mark i. 29. Mat. viii. 14. Luke iv. 38.). St. Andrew, having been first called by Jesus Christ, met his brother Simon, and told him, (John i. 41.) We have found the Messiah, and then brought him to Jesus. Jesus beholding him, said to him, Thou art Simon, son of Jonah; henceforth thou shalt be called Cephas, that is, stone or rock. After having passed one day with our Saviour, they returned to their ordinary occupation, which was fishing. Yet it is thought they were present with him at the marriage of Cana in Galilee. This happened in the 30th year of the vulgar Christian era.

The acts which distinguish the apostleship of St. Peter are fully detailed in the sacred scriptures; for which reason we forbear to introduce them in this place.

St. Peter was the author of two epistles, received into the canon of the New Testament. Of these the former was written from a city which the apostle called Babylon; whether he meant the remains of the former city of Baby-

ion, or adumbrated Jerusalem under that name, is uncertain: Michaelis inclines to the latter opinion. The date of this first epistle is generally assigned between the years 63 and 65. The second epistle, written soon after the former, and (ch. i. 14.) when the apostle was old and near his end, is usually dated in 65. The apostle suffered martyrdom not long after this epistle was written, that is, at latest, about A. D. 68.

St. Peter's style, says a modern author, expresses the noble vehemence and fervour of his spirit, the full knowledge he had of Christianity, and the strong assurance he had of the truth and certainty of his doctrine; and he writes with the authority of the first man in the college of the apostles. He writes with that quickness and rapidity of style, with that noble neglect of some of the formal consequences and niceties of grammar, still preserving its true reason, and natural analogy (which are always marks of a sublime genius), that you can scarce perceive the pauses of his discourse and distinction of his periods. The great Joseph Scaliger calls St. Peter's first epistle majestic; and we hope he was more judicious than to exclude the second, though he did not name it.

A noble majesty, and becoming freedom, is what distinguishes St. Peter; a devout and judicious person cannot read him without solemn attention and awful concern. The conflagration of this lower world, and future judgment of angels and men, in the third chapter of the second, is described in such strong and terrible terms, such awful circumstances, that in the description we see the planetary heavens and this our earth wrapped up with devouring flames, hear the groans of an expiring world, and the crushes of nature tumbling into universal ruin.

The authority of the second epistle of St. Peter was for some time doubted of, as Origen, Eusebius, St. Jerome, and others, have observed. What made the ancients call it in question, is the difference of its style from the first. The third chapter, which describes the catastrophe of the visible world, made Grotius think this epistle was wrote after the taking of Jerusalem; because that was not to happen till after the destruction of that city; upon which he conjectures, that Simeon, bishop of Jerusalem, is the author of this epistle, and that the inscription which carries St. Peter's name is corrupted. But the best critics admit this epistle to be the genuine work of St. Peter, who discovers himself where he says, that he was present at our Lord's transfiguration; and where he tells the Jews, this was the second letter he had written to them. The reader may see this question fully discussed, and the authority of this epistle established beyond all doubt, by the learned Dr. Sherlock, in his Dissertation on the authority of the Second Epistle of St. Peter.

St. Peter has been made the author of several books, such were his Acts, his Gospel, his Revelation, his work about preaching, and another about judgment. There is extant a

large history of St. Peter, called the Recognitions, ascribed to St. Clement.

PETER ALEXIOWITZ I. surnamed the Great, succeeded to the throne of Muscovy, on the death of his brother Theodore, to the exclusion of his elder brother Iwan, whose intellects were too feeble to support the fatigues of government. This gave offence to Sophia, his half sister, who roused into rebellion the Strelitzes, a formidable body of militia; but Peter, too wise to foment a civil war, consented to share the throne with his brother Iwan. Without education, yet with the strongest powers of nature, Peter felt that much was still to be acquired before he could realize the vast projects of his mind. To counteract the Strelitzes, who were devoted to the intriguing Sophia, and more inclined to dispute than to obey his commands, he became the favourite of the army, and enlisting as a private soldier in a company dressed and disciplined in the German manner, he gradually rose to command by his services, and by sharing the toils and privations of a military life. By the death of his brother in 1696, he became sole emperor, and then conquered Azoph from the Turks. Feeling his inferiority as a naval power, he sent, in 1698, an embassy to Holland, and went in a disguised character in the ambassador's suite; and that he might personally be acquainted with the process of ship-building, he enrolled himself at Amsterdam among the ship carpenters, and worked under the name of master Peter. The next year he passed over to England, where he acquired the complete knowledge of ship-building, and after receiving every mark of respect from William III. he left this country, accompanied by several English ship-builders, and artificers. From England he went to Vienna; but the intelligence that Sophia had roused the Strelitzes to rebellion hastened his return to Moscow. The ringleaders were punished; but the princess, who was the most guilty, was only confined in a monastery. Improved by the view of foreign countries, and the knowledge of their commercial resources, Peter now displayed to the world the enlightened plans of his capacious mind. He liberally invited the most learned among distant nations to seek an honourable residence in Russia, and to instruct his uncivilized subjects in the various arts of life. Russia was therefore visited by sailors, artists, mechanics, mathematicians, and adventurers of every degree and profession; and though his subjects viewed these new settlers with jealousy, Peter soon mingled and united them by the strong ties of mutual dependence and social union. In 1700 he declared war against Charles XII. of Sweden, and though defeated by his enemy, he persevered with undaunted courage, observing, "though I know I must be overcome for a great while, my armies will at last be taught to conquer." In the midst of his disasters in Poland, he formed the project of erecting a new metropolis on the Baltic sea, and after he had added to his dominions the best part of Livonia and Ingria, he,

in 1703, laid the foundations of Petersburg. At last the battle of Pultowa, in 1709, crowned his earnest wishes, and he saw the long victorious Swedes conquered, and their heroic leader Charles obliged to fly. Peter used this victory like a wise man; the Swedish prisoners were induced to settle among their conquerors, and not less than 3000 officers were prevailed upon to fix their residence and spread civilization, improvement, and the arts of polished life, in various parts of his extensive empire. In consequence of the victory of Pultowa, Peter secured the possession of Livonia and Ingria, to which he added part of Pomerania and Finland; but the intrigues of Charles XII. at the Turkish court at last prevailed upon the Ottomans to break the truce, and in 1712 Peter was suddenly surrounded on the banks of the Pruth, and his army devoted to destruction. While he considered every thing as lost, his wife Catherine, offering a large bribe to the grand vizier, saved her husband's honour and his army, and in consequence of this the grateful czar established the order of St. Catherine, into which only women are admitted. After the treaty of peace with Charles XII. Peter visited again foreign countries. In 1716 he was in Denmark, and after visiting the schools, public places, and curiosities, he passed to Hamburg, Hanover, Wolfenbuttle, and Holland, and the next year proceeded to Paris. In the capital of France he was received with great ceremony; but despising the pomp and pageantry of greatness, he preferred the conversation of the learned, and returned home better pleased with the information which he had received, than with the unmeaning marks of homage paid to his imperial rank. When at Paris he visited the tomb of Richelieu, exclaiming, "great minister, would it might have happened you had lived in my age, I would have granted you half of my dominions to learn from you how to govern the rest." Returned to Russia, Peter laboured to reform and improve the character of his country. After breaking gradually to pieces the dangerous establishment of the Strelitzes, he appointed a regular body of 100,000 troops; he built a navy of 40 ships of the line; he established colleges and schools of medicine, botany, belles lettres, &c. in the chief cities of his dominions, and by purchasing pictures of celebrity from Italy, he introduced a taste for painting and the fine arts among his subjects; and made the largest possible collections of books and manuscripts in various languages, wisely distributed where they could prove most useful. Religion, pure and uncorrupt, was made, as far as his zealous endeavours could, to supersede superstition and ignorance; the patriarchate, once formidable even to the sovereign, was abolished, and the people were instructed in their own, and not in a foreign language. The laws were rendered more simple, decisions were to be announced before the expiration of 11 days; and in short every measure which could tend to meliorate the situation of the people, to increase their knowledge, and to

contribute to their comfort, was, with the most liberal policy, adopted and enforced. This truly great and worthy prince died of a strangury, caused by an imposthume in the neck of his bladder, 28th Jan. 1725, in his 53d year. Peter had a son, Alexis, who lived to the age of manhood; but engaged in a conspiracy in 1717, against his father, and was condemned to die; and though the sentence was suspended, he died some short time after, not without suspicion of being cut off privately by the czar, as several of his accomplices suffered the severest punishment of the law. At his death, Peter appointed for his successor his widow Catherine, whom, from a soldier's wife, he had raised, in consequence of her heroic character, to share his bed and his throne. Peter wrote several pieces on naval affairs. (*Lempriere.*)

PETER II. emperor of Russia, son of Alexis Petrowitz, succeeded the empress Catherine, at the age of 13, in 1727. The prominent feature of his reign is the banishment into Siberia of the great favourite Menzikoff. The emperor died of the small-pox, 1730, aged 15.

PETER III. emperor of Russia, son of Anne, the eldest daughter of Peter the Great, was born 1728, and ascended the throne after the empress Elizabeth, 1761. The beginning of his reign was auspicious; he admired the character of the heroic king of Prussia, but unfortunately wanted the vigour and decision which marked that great man. His attempts therefore to reform his people proved abortive, and rendered him contemptible; so that his wife Catherine, taking advantage of his timidity, dethroned him, 6th July, 1762, and assumed the reins of government under the name of Catherine II. Peter died seven days after; but though his death is attributed to an hemorrhoidal flux, it is too evident that violence terminated his existence.

PETER, of Cluni, or the Venerable, was born in Auvergne, and was made, in 1121, general of the order of Cluni. He received at his abbey pope Innocent II. in 1130, and afterwards granted a kind asylum to the unfortunate Abelard. He died 1156, aged 65. He wrote treatises on the divinity of Christ—against the Jews—on infant baptism—the authority of the church, &c.

PETER, an ecclesiastic of Blois, preceptor and secretary to William II. king of Sicily. He was invited by Henry II. to England, where he obtained the archdeaconry of Bath, and afterwards that of London. He died in England, 1200. Of his writings, 183 letters, 65 sermons, &c. have been preserved.

PETER, the Hermit, a gentleman of Amiens, who quitted the military profession to become a pilgrim. Under the expectation of the immediate dissolution of the world, he, with many other deluded men, hastened to the Holy Land, in 1093, that he might terminate his days in a spot where the Saviour was born. On his return, he spoke in so affecting a manner of the cruel treatment which the Christ-

ians experienced in Palestine, that Urban II. sent him over Europe to preach a general crusade to deliver the Holy Land from the infidels. The eloquence of Peter, and the spirit of the times, prevailed; a numerous concourse of people flocked together, and the holy hermit began his march at the head of above 40,000 men. In crossing Hungary, this religious army committed the most horrid excesses, and so provoked the inhabitants, that in skirmishes with them and with the Turks, many lost their lives, and only 3000 reached the gates of Constantinople. In advancing through Asia, the siege of Antioch delayed their progress, and Peter would have abandoned the enterprise, had he not been bound by an oath by Tancred to share the dangers of the crusade. At the conquest of the Holy Land, and in the siege of Jerusalem, 1099, Peter behaved with valour, and for his services was appointed vicar-general of Palestine. He afterwards returned to Europe, and died at the abbey of New-Montier, which he had founded. (*Lempriere.*)

PETER the wild boy, a youth found in a savage state in the woods in Hanover, 1726, where he had lived for some time on berries and roots. He was about 12 years old, but it is unknown how long he had been in that wild state; though from the remains of a shirt collar found about his neck, it is probable he had not been many years exposed. He came to England in 1727, and was placed at a farmhouse at Northchurch, Hants; but no instruction could ever make him articulate words; and he died in 1735, a melancholy instance of savage idiotism. The English government allowed a pension of 35*l.* a year for his support.

PETER AND PAUL (St.), or PETROPAULSKOI, a seaport of Russia, in Kamschatka. The town consists of some log-houses, and a few conical huts. Captain Clarke, who succeeded captain Cook, and died at sea, was interred here. It is seated on the E. side of Awatska bay. Lon. 158. 48 E. Lat. 53. 1 N.

PETER-PENCE was an annual tribute of one penny, paid at Rome out of every family, at the feast of St. Peter. And this Ina, the Saxon king, when he went in pilgrimage to Rome, about the year 740, gave to the pope partly as alms, and partly in recompense of a house erected in Rome for English pilgrims. And this continued to be paid generally until the time of king Henry VIII. when it was enacted, that from henceforth no person shall pay any pensions, Peter-pence, or other impositions, to the use of the bishop or see of Rome.

PETERBOROUGH, a city of Northamptonshire, 81 miles from London. It is the least city except perhaps Ely, and unquestionably the poorest bishopric, though one of the oldest towns in England. It had a monastery dedicated to St. Peter, and founded as early as the year 655, to which the abbot of Croyland and his monks flying for protection in the year 970, they were overtaken and murdered in a

court of this monastery, called the monks church-yard, because they were all buried here; and to this day is to be seen the tombstone, with their effigies, which had been erected over their common grave. Soon after this the Danes destroyed both the monastery and friars, so that it lay destitute for above 100 years. The monks were, however, restored, and lived very sumptuously, with a mitred abbot at their head, till the Reformation, when Henry VIII. converted it into a bishop's see. The cathedral, which is said to be more than 1000 years old, though apparently more modern, is a most noble Gothic fabric, and was much more so before it was defaced in the civil wars. The west front, which is 156 feet broad, is very stately, and, besides columns curiously adorned, is supported by three of the tallest arches in Britain. The windows of the cloisters are finely stained with scripture history and the succession of it abbots. There are in the church, monuments of queen Catherine, wife of Henry VIII. and of Mary queen of Scots; and the figure of one Scarlet, or Scailett, the sexton, who buried them, and lived to 95, after he had buried all the housekeepers of the town twice over. There is but one parish church besides the cathedral. The city is governed like a borough, by a charter of Henry VIII. though without either mayor or aldermen; and sends two members to parliament, every pot-walloper in the town having the liberty of voting. All the officers of the city are elected by the dean and chapter, consisting of six prebendaries, who are all lords of the manor. Besides the dean and chapter, who are an ecclesiastical corporation distinct from the bishop, there are eight petty canons, four students in divinity, one epistler, one gospeller, a subdean, subtreasurer, and chanter, eight choristers, eight singing men, two chancellors, besides a steward, organist, &c. a grammar school, and two charity-schools. The river Nen, over which there is here a wooden bridge, is navigable by barges to Northampton, 50 miles further, which bring coal, corn, &c. and by which they export, in some years, 6000 quarters of malt, besides other goods, especially the woollen manufactures either of cloth or stockings, in which the poor are employed. The air of Peterborough is said not to be very wholesome, by reason of the neighbouring fens; but the water of the river is fresh and good, the highest spring-tide scarcely ever coming up within five miles of the town; and there is plenty of excellent water in their wells. The streets are some of them very narrow, though they have been recently much improved by new paving, under an act of parliament. There is a handsome market-house, over which are kept the assizes and sessions. Its jurisdiction extends over 32 towns and hamlets, wherein the civil magistrates appointed by the royal commission are vested with the same power as judges of assize, and hold their quarterly sessions in this city. Lon. 0. 4 W. Lat. 52. 30 N.

PETERHEAD, a seaport of Scotland, in
P

Aberdeenshire, situate on a peninsula, about a mile S. of the mouth of the Ugie. It has two harbours, defended by piers; a considerable trade in the fishery, and to the Baltic; and manufactures of thread, woollen cloth, and cotton. Here is a small fort and a battery. A mineral spring, of a powerful diuretic quality, and the sea-bathing, bring a great resort of company, for whose accommodation there is a ball-room, and many elegant houses. It stands a little to the W. of Buchanness, the most eastern promontory of Scotland, 34 miles N.E. of Aberdeen. Lon. 1. 35 W. Lat. 57. 27 N.

PETERSBURG, a town of Pennsylvania, in York county, 25 miles S.W. of York, and 58 N. of Washington.

PETERSBURG, a town of Virginia, in Dinwiddie county. It has a considerable trade, particularly in tobacco and flour, and is seated on the S. side of the Appamatox, 25 miles S. of Richmond.

PETERSBURG, a town of the state of Georgia, in Albert county, situate at the confluence of Broad with Savannah river, 40 miles N.W. of Augusta.

PETERSBURG, or **ST. PETERBURG**, the metropolis of the empire of Russia, in a government of the same name, with a university. It is seated on the Neva, near the gulf of Finland, and built partly on some islands formed by the river, and partly upon the continent. The ground on which Petersburg now stands was a vast morass, occupied by a few fishermen's huts. Peter the Great first began this city by the erection of a citadel with six bastions, in 1703; he built also a small hut for himself, and some wooden hovels. In 1710, count Golovkin built the first house of brick; and the next year the emperor, with his own hands, laid the foundation of a house of the same materials. From these small beginnings rose the imperial city of Petersburg; and in less than nine years after the wooden hovels were erected, the seat of empire was transferred to it from Moscow. The streets are straight, and generally broad and long, frequently intersecting each other in abrupt and sharp corners; and three of the principal ones, which meet in a point at the admiralty, are above two miles in length: most of them are paved, but a few still remain floored with planks; and numerous canals, from one part of the river to another, pass through many of them, by which the inhabitants are supplied with water. In several parts, wooden houses, scarcely superior to common cottages, are blended with the public buildings; but as they are not suffered to be repaired, or if burnt down, to be rebuilt, the number of them is now reduced one half; however, the mother of all that exists in the city, the first wooden cottage of Peter the Great, has a brick building on arches erected over it, to preserve it as a sacred relic of that monarch. The brick houses are covered with stucco, painted of a pink, yellow, or green colour; the roofs of them are nearly flat, formed of sheet or cast iron, or sheet copper, and com-

monly painted green or red: tiles are only used for outhouses and the meaner sort of buildings. The mansions of the nobility are vast piles of building, furnished in the most elegant style. Petersburg, though more compact than the other Russian cities, bears a resemblance to the towns of this country, and is built in a very straggling manner. On the S. and S.E. it has a boundary formed by the town ditch, which is dug far beyond the built parts; and on the N.E. and N. flows the most northern branch of the Neva, called the Nevka, which includes a still more ample interstice. The circumference by these and the sea is nearly 20 miles; but the part properly built upon occupies little more than one-fourth of this space. The inhabitants are computed to be 230,000. The main stream of the Neva is, in many places, as broad as the Thames at London, and its banks are lined on each side with a continued range of handsome buildings. On the N. side are the grand ducal palace, the fortress, the custom-house, the academy of sciences, and the academy of arts. On the S. side are the imperial palace, the marble palace, the admiralty, the arsenal, the bank, the mansions of many Russian nobles, and the English-line, so called, because the whole row is almost wholly occupied by English merchants. In the front of these buildings is the quay, which extends three miles, except where it is interrupted by the admiralty; and the Neva, during the whole of that space, is embanked by a wall, parapet, and pavement of hewn granite. The opposite divisions of Petersburg, situate on each side of the Neva, are connected by two bridges, on pontoons; and there are several others over the different arms of the river. These bridges, on account of the large masses of ice driven down the stream from the lake Ladoga, are usually removed when they first make their appearance; and for a few days, till the river is frozen hard enough to bear carriages, there is no communication between the opposite parts of the town. Among the noblest ornaments of Petersburg, is an equestrian statue of Peter the Great, in bronze, of a colossal size; the pedestal of which is a huge rock, brought to the spot at a great expence. Within the walls of the fortress is the cathedral of St. Peter and St. Paul, in which are deposited the remains of Peter the Great, and of the successive sovereigns, except Peter II. buried at Moscow. Petersburg has a considerable trade in exporting the products of the empire, and has a communication by canals and rivers with many of the southern provinces as far as Astrachan, on the borders of the Caspian sea. It is 425 miles N.W. of Moscow, 500 E. by N. of Stockholm, and 1000 N.N.E. of Vienna. Lon. 30. 19 E. Lat. 59. 56 N.

PETERSFIELD, is a handsome town of Hampshire, in England, and sends two members to parliament. It is seated in lon. 1. 5 W. Lat. 51. 5 N.

PETERWARADIN, a fortified town in Slavonia, and one of the strongest frontier places the house of Austria has against the

Turks, seated on the Danube, between the Drave and the Save. Lon. 20. 0 E. Lat. 45. 20 N.

PETER WORT, in botany. See ASCYRUM.

PETESIA, in botany, a genus of the class tetrandria, order monogynia. Corol one-petalled, funnel-form; stigma bifid; berry many-seeded. Shrubs of West Indies and Polynesia.

PETHERTON, a town in Somersetshire, with a market on Tuesday; seated on the Parret, 18 miles S. by W. of Wells, and 133 W. by S. of London. Lon. 2. 41 E. Lat. 50. 56 N.

PETILIA, a town of Magna Græcia, the capital of Lucania, built by Philoctetes, who after his return from the Trojan war left his country Melibœa, because his subjects had revolted.

PETILII, two tribunes who accused Scipio Africanus of extortion. He was acquitted.

PETILIUS. The most remarkable of this name is a governor of the capitol, who stole the treasures intrusted to his care. He was accused, but though guilty, he was acquitted, as being the friend of Augustus.

PETIOLAR CIRRUS. A petiolar tendril. Proceeding from the petiole of a leaf. A petiolar peduncle. Inserted into a petiole. A petiolar bud. Formed from a petiole. A petiolar gland. Growing on the petiole: as in ricinus, iatropa, passiflora, cassia, mimosa, &c.

PETIOLATE LEAF. A petioled leaf. Growing on a petiole or footstalk, inserted into it usually at the base. Opposed to sessile.

PETIOLE. In botany, a leaf-stalk or footstalk. Trunci species, adnectens folium, nec fructificationem. Philos. Bot. Fulcrum sustinens folium. Delin. Pl. Ramus foliiferus, folio proprius. Regn. Veg. A partial stem, supporting the leaf, or connecting it with the stem or branch. It sometimes happens, but very rarely, that the same foot-stalk supports both leaf and fructification, as in turnera and hibiscus.

PETIOLULE. A partial petiole. Connecting a leaflet with the main petiole, in compound leaves.

PETIT (Peter), a considerable mathematician and philosopher of France, was born at Montluçon, in the diocese of Bourges, in the year 1589, according to some, but in 1600 according to others. He first cultivated the mathematics and philosophy in the place of his nativity; but in 1633 he repaired to Paris, to which place his reputation had procured him an invitation. Here he became highly celebrated for his ingenious writings, and for his connections with Pascal, Des Cartes, Mersenne, and the other great men of that time. He was employed on several occasions by cardinal Richelieu; he was commissioned by this minister to visit the seaports, with the title of the king's engineer; and was also sent into Italy upon the king's business. He was at Tours in 1640, where he married; and was

afterwards made intendant of the fortifications. Baillet, in his Life of Des Cartes, says that Petit had a great genius for mathematics; that he excelled particularly in astronomy; and had a singular passion for experimental philosophy. He was intimately connected with Pascal, with whom he made, at Rouen, the same experiments concerning the vacuum, which Torricelli had before made in Italy; and was assured of their truth by frequent repetitions. He died August the 20th, 1667, at Lagny, near Paris, whither he had retired for some time before his decease. He published several works upon physical and astronomical subjects, as well as on chronology and theology.

PETIT, or PETITE, a French word signifying little or small.

PETITE GUERRE denotes the operations of detached parties and the war of posts. See WAR.

PETIT SERGEANTY. See SERGEANTY.

PETIT TREASON. See TREASON.

PETIT GUAVE, a seaport of St. Domingo, seated on a bay at the west end of the island. It is 200 miles E. of Jamaica. Lon. 72. 52 W. Lat. 18. 27 N.

PETITIA, in botany, a genus of the class tetrandria, order monogynia. Calyx four-toothed, inferior; corol four-parted; drupe with a two-celled nut. One species, a shrub of St. Domingo, with flowers in axillary panicles.

PETITIO PRINCIPII, in logic, the taking a thing for true, and drawing conclusions from it as such, when it is really false; or at least wants to be proved before any inferences can be drawn from it.

PETITION, a supplication made by an inferior to a superior, and especially to one having jurisdiction. It is used for that remedy which the subject hath to help a wrong done by the king, who hath a prerogative not to be sued by writ: in which sense it is either general, that the king do him right; whereupon follows a general indorsement upon the same. Let right be done the party: or it is special, when the conclusion and indorsement are special, for this or that to be done, &c.

By statute, the soliciting, labouring, or procuring the putting the hands or consent of above twenty persons to any petition to the king, or either house of parliament, for alterations in church or state, unless by assent of three or more justices of the peace of the county, or a majority of the grand jury at the assizes or sessions, &c. and repairing to the king or parliament to deliver such petition with above the number of ten persons, is subject to a fine of 100l. and three months imprisonment, being proved by two witnesses within six months, in the court of B. R. or at the assizes, &c. And if what is required by this statute be observed, care must be taken that petitions to the king contain nothing which may be interpreted to reflect on the administration; for if they do, it may come under the denomination of a libel: and it is remarkable, that the petition of the city of London for the

sitting of a parliament was deemed libellous, because it suggested that the king's dissolving a late parliament was an obstruction of justice; also the petition of the seven bishops sent to the Tower by James II. was called a libel, &c. To subscribe a petition to the king, to frighten him into a change of his measures, intimating, that if it be denied, many thousands of his subjects will be discontented, &c. is included among the contempts against the king's person and government, tending to weaken the same, and is punishable by fine and imprisonment.

PETITION. *s.* (*petitio*, Lat.) 1. Request; intreaty; supplication (*Shakspeare*). 2. Single branch or article of a prayer (*Dryden*).

To PETITION. *v. a.* (from the noun.) To solicit; to supplicate (*Addison*).

PETITIONARILY. *ad.* (from *petitionary*.) By way of begging the question (*Brown*).

PETITIONARY. *a.* (from *petition*.) 1. Supplicatory; coming with petitions (*Shaks.*). 2. Containing petitions or requests (*Hooker*).

PETITIONER. *s.* (from *petition*.) One who offers a petition (*South*).

PETITORY. *a.* (*petitorius*, Lat. *petitoire*, Fr.) Petitioning; claiming the property of any thing (*Ainsworth*).

PETITOT (John), a curious painter in enamel, born at Geneva, in 1607. He associated his labours with Bordier, his brother-in-law, jointly with whom he painted the portraits of Charles I. and the whole royal family. He died in 1691.

PETIVER (James), a skilful English botanist, contemporary with Plukenet, was apothecary to the charter-house, and died in 1718. Sir Hans Sloane purchased his collection of plants after his death, and with many other learned men attended his funeral, out of respect for his talents.

PETIVERIA. Guinea hen-weed. In botany, a genus of the class heptandria, order monogynia. Calyx four-leaved; corolless; style lateral; stigma pencil-form; seed one with four reflected awns at top. Two species; herbs of Jamaica.

PETOLA, in botany. See **MOMORDICA**.

PETOUNE, a city of Eastern Chinese Tartary, in the department of Kirin. It has scarcely any inhabitants but Tartar soldiers, and Chinese condemned to exile. It is seated on the Songari, 112 miles N. by E. of Kirin, and 500 N.E. of Pekin. Lon. 124. 55 E. Lat. 45. 3 N.

PETRA, the capital town of Arabia Petræa. *Strab.*—This name was common also to four towns in Europe.

PETRÆA, one of the Oceanides.—A part of Arabia, which has Syria at the E. Egypt on the W. Palestine on the N. and Arabia Felix at the S. This part of Arabia is rocky, whence it has received its name. It is for the most part also covered with barren sands.

PETRAPIUM. (*petrapium*, from *petra*, a rock, and *apium*, parsley, so called because it

grows in stony places. **PETROSELINUM** which see.

PETRARCH (Francis), a celebrated Italian of the 14th century, born at Arezzo, in 1304. His genius led him equally to poetry, eloquence, history, and moral philosophy, and the poems which he wrote on his Laura immortalized his name. His father was a Florentine, involved in the political factions of the Bianchi, and wished his son to study the law in aid of his views: but Petrarch was not fond of a court life, and preferred retirement; he therefore fixed his residence at Vaucluse, five miles from Avignon, where he devoted himself to literary pursuits. This spot became endeared to him from his love for the beautiful Laura de Noves, whom he first saw and passionately admired in 1627; but though the feelings of his heart were conveyed in the rapturous language of elegant poetry, he could, it is said, make no impression on the unkind fair. To divert his affections, he travelled, and after visiting Paris, Flanders, Germany, and Rome, he was persuaded to enter into the service of John XXII. The love of Vaucluse and of Laura, however, prevailed over the temptations of greatness; and Petrarch, once more restored to his favourite seat, again devoted his hours to studious pursuits, and to the praises of his beloved mistress. The sweetness of his poetry, and the graces of his muse, spread his celebrity beyond the confines of Avignon, and at the same moment he was solicited by the senate of Rome, by the university of Paris, and by the king of Naples, to come and receive the poetical crown. The offers of Rome, once the mistress of the world, and the cradle of poets, historians, and orators, were too flattering to be withstood, and the modest bard appeared in the capitol, where the poetic crown was fixed on his head with the most solemn ceremony on Easter-day, 1341, and he was declared a citizen of Rome. In 1343 he was drawn from his favourite Vaucluse by Clement VI. who sent him to compliment Joan on her accession to the Neapolitan crown. While at Verona, he was informed of the death of Laura, a melancholy event which deeply affected him, and which he immortalized by all the powers of poetry. In 1352 he bid adieu for ever to Vaucluse, which the death of Laura had converted from a scene of pleasure to melancholy reflection; and entering the service of the Visconti, he engaged in negotiations. Though informed that his patrimony was restored by the Florentines, he preferred to these new honours the peaceful retreat of Arquà, near Padua, given him by his friend de Carrara, and there he died July 1374, aged 70. Petrarch was an ecclesiastic, though he never took priest's orders. He was in private life a very amiable character, and was guided by moderation, though flattered by the great, and honoured by the powerful. His passion for Laura was of the purest kind; though some have ventured to assert, that it was not unmixed with the most licentious concessions. Petrarch as a poet is deservedly

celebrated as one of the restorers of classical learning, and he displayed all the powers of genius and poetical inspiration, not only in his own native language, but in Latin. His sonnets are esteemed as the sweetest, the most elegant, and most highly finished verses ever written in Italian, and his songs possess equal beauty and grace. His Latin poems are not entitled to similar praise. His *Africa*, or the Punic war, is censured as faulty and unclassical. His other works are *de remediis utriusque fortunæ*, &c. translated into French—*de otio religiosorum*—*de verâ sapientiâ*—*de vitâ solitariâ*—*de contemptu mundi*—*rerum memorabilium libri sex*—*de republicâ optime administrandâ*, &c. (*Lemprière*).

PETRE, or SALT PETRE. See NITRE.

PETREA, in botany, a genus of the class didynamia, order angiospermia. Calyx five-parted, very large, coloured; corol wheel-shaped; capsule two-celled, in the bottom of the calyx; seeds solitary. One species, a climbing shrub of America, with blue racemed flowers.

PETREL, in ornithology. See PROCEL-LARIA.

PETRE/SCENT. *a.* (*petrescens*, Latin.) Growing stone; becoming stone (*Boyle*).

PETRIFICATION. *s.* (from *petrify*, Lat.) 1. The act of turning to stone; the state of being turned to stone (*Brown*). 2. That which is made stone.

PETRIFICATION, in natural history, the conversion of vegetable or animal materials into a stony substance. In this conversion these materials are more or less altered from their original state, according to the different fossils they have lain buried among: some of them suffering but little change, and others being highly impregnated with crystalline, spongy, pyritic, or other extraneous matter.

The present subject, as to the substances actually traced in a petrified state, belongs to that branch of science which has of late been denominated ORYCTOLOGY, and will be found treated of under that article. We shall here only briefly advert to the process by which it is probable the extraordinary effect of petrification in vegetable and animal materials is produced.

It is necessary, however, to premise, that petrification has by some mineralogists been understood in a much larger sense than that in which it is understood generally, and in which we mean to employ it ourselves; as importing the formation of stony substances of all kinds; and in this general view it has been divided into two parts; *lapidification* and *substitution*: the former relating to such stony materials as are native or primary minerals, as rocks and fragments of rocks, produced by the processes of aggregation, or cementation; and the latter relating to such as are secondary or adventitious, and produced by a conversion of some part of the vegetable or animal kingdoms into a stony form. It is to the last of these two divisions that the present article relates.

Among plants it is obvious that it can only

be the harder or woody part that can alone be converted into a petrified state, since the more juicy parts are very rapidly decomposed by the process of putrefaction.

Even wood itself, in ordinary circumstances, whether upon the surface of the earth or buried under it, is gradually, by the concurrent action of air and water, decomposed; its texture is broken down, the connexion between the several vegetable principles of which it consists is dissolved, its ingredients enter into new combinations, and no vestige remains, either of its organization or chemical properties. Sometimes, however, it happens that the external figure and internal arrangement are preserved, while the chemical properties have undergone a very obvious alteration, in consequence of which the natural decay is prodigiously retarded; and in various instances even wholly suspended: and it is under this last change that wood is said to be petrified or mineralized.

There are three substances by which this change is brought about, namely, pyrites, oxyd of iron, and siliceous earth, in the form of agate, or hornstone: each of which forms a distinct species of petrified wood.

Pyritous fossil wood occurs principally in the independent coal formation; it is composed entirely of common pyrite, often in a state of semi-decomposition; it appears to contain no ligneous particles, but retains with considerable exactness the external figure, and, in some degree, the internal organization, of wood. The reason why this species presents a less striking resemblance to wood than the others do, is probably the strong crystalline polarity which pyrite possesses. In splitting longitudinally a piece of pyritical wood, it not unfrequently happens that the fibres representing the concentric layers of wood are composed of minute cubes laterally aggregated to each other.

Ferruginous fossil wood is found in hematite, and especially in argillaceous iron ore. Externally it presents the appearance of trunks and branches, and its internal texture has a close resemblance to that of wood. In its chemical composition it does not appear to differ materially from common argillaceous iron ore.

Agatized wood, however, is that which has been chiefly examined, and which presents us with by far the most beautiful specimens of this kind of fossils. It has been made a distinct mineral species by Werner, who has given it the name of holstein or woodstone, of which the following are the characters.

Its colour is ash-grey, passing into greyish-black, yellowish, brownish, and blood-red; the colours run into each other, forming clouds and stripes in a longitudinal direction. It occurs in the shape of trunks, branches, and roots, and presents in the utmost perfection the internal organization of wood, not only the longitudinal fibres and concentric layers being visible, but even the knots and medullary processes. Its internal lustre is various, being

between glistening and dull. Its cross fracture is imperfectly conchoidal, its longitudinal fracture is splintery and fibrous. It is moderately translucent; is harder than glass, and gives fire with steel, but is easily frangible.

It occurs in sand and sand-stone, especially in the hill St. Symphorien near Etampes in France, in Saxony, Bohemia, and Hungary; near Loch Neagh in Ireland, in the beds of sand-stone that lie above the fuller's earth near Woburn in Bedfordshire, and also in the sandy deserts to the west of Egypt. See Nat. Hist. Pl. CVIII. CXII. and CXV.

It not unfrequently happens, that agatized wood before the petrifying process has begun, has been corroded by worms; in which case not only the perforations are filled with siliceous matter, but even the substance of the worm itself has been completely agatized.

Agatized wood discovers slight traces of its origin by affording a few drops of a watery empyreumatic liquor by distillation. It consists however, for the most part, of silex. The origin of petrified wood is generally attributed to the gradual infiltration of the petrifying material; but to this theory, simple, and ingenious, and plausible as it is, there are many objections that yet require to be removed. See the articles CHALCEDONIUS and OPALUS.

Petrified animal substances are produced in the same manner as petrified vegetable substances; and for the reason that we seldom meet with any of the softer parts of plants in a petrified form, we seldom also meet with any of the softer parts of animals; all these equally dissolving in so short a period as to give no opportunity, or nearly so, to the petrifying material, whether of pyritous or siliceous water or other fluid, to infiltrate itself into their vessels, and become substituted for their proper juices before the whole is completely destroyed and wasted away. Hence it is chiefly the bones of quadrupeds, birds, and other animals of the higher classes, and the crusts and shells of insects and worms, that are discovered in this state: upon which we have already written at some length in the article ORYCTOLOGY, and now refer the reader to it.

PETRIFA'CTIVE. *a.* (from *petrifacio*, Lat.) Having the power to form stone (*Bro.*).

PETRIFICATION. *s.* (*petrification*, Fr.; from *petrify*.) A body formed by changing other matter to stone (*Boyle*).

PETRIFIC. *a.* (*petrificus*, Latin.) Having the power to change to stone (*Milton*).

To PETRIFY. *v. a.* (*petrifier*, Fr.; *petra* and *fit*, Latin.) 1. To change to stone (*Woodward*). 2. To make callous, or obdurate.

To PETRIFY. *v. n.* To become stone (*Dryden*).

PETRIKOW, a town of Great Poland, in the palatinate of Siradia, 80 miles S.W. of Warsaw. Lon. 19. 46 E. Lat. 51. 12 N.

PETRILITE, in mineralogy, a species of felspar. See FELDSPATUM.

PETRINA, or PETRINIA, a strong town of Austrian Croatia, seated on the Petrina; 27

miles E. of Carlstadt. Lon. 16. 0 E. Lat. 46. 0 N.

PETROBRUSSIANS, a religious sect, which had its rise in France and the Netherlands about the year 1110. The name is derived from Peter Bruys, a Provencal, who made an attempt, in most respects laudable, to reform the abuses and remove the superstition that disgraced the beautiful simplicity of the gospel. His followers were numerous; and for 20 years his labour in the ministry was exemplary and unremitted. He was, however, burnt in the year 1130 by an enraged populace set on by the clergy.

The chief of Bruys's followers was a monk named Henry; from whom the Petrobrussians were also called Henricians. Peter the Venerable, abbot of Clugny, has an express treatise against the Petrobrussians; in the preface to which, he reduces their opinions to five heads. 1. They denied that children before the age of reason can be justified by baptism, in regard it is our own faith that saves by baptism. 2. They held that no churches should be built, but that those that already are should be pulled down; an inn being as proper for prayers as a temple, and a stable as an altar. 3. That the cross ought to be pulled down and burnt, because we ought to abhor the instruments of our Saviour's passion. 4. That the real body and blood of Christ are not exhibited in the eucharist, but merely represented by their figures and symbols. 5. That sacrifices, alms, prayers, &c. do not avail the dead.

PETROCARYA, in botany, a genus of the class heptandria, order monogynia. Calyx five-cleft; corol five-petalled; stamens fourteen, of which seven are barren; drupe fleshy, fibrous; nut two-celled with a single seed in each cell. Two species, trees of Guiana.

PETROLEUM, in mineralogy, a species of BITUMEN, which see.

PETRONEL. *s.* (*petrinal*, French.) A pistol; a small gun used by a horseman (*Hudibras*).

PETROMYZON. Lamprey. In zoology, a genus of the class pisces, order chondroptergia. Head slenderer than the body; mouth longer above than beneath; teeth orange, hollow within, and surrounded with a fleshy margin, above a little curved, beneath broad; spiracles seven on each side of the neck; on the nape a fistulous opening; without pectoral and ventral fin. These adhere firmly to rocks and other bodies by the mouth, the edges of which are jagged; the body is eel-shaped, slippery and mucous: they live a long time out of the water, and feed on worms, insects, less fishes, and dead bodies; belly long, narrow; vent near the pinnate tail; dorsal fins two; round the eyes numerous perforations; tongue semilunar, hard; teeth serrate. Four species.

1. *M. marinus*. True lamprey. Sea-lamprey. Mouth papillous within; second dorsal fin distinct from the tail. The name petromyzon, or lampetra, as it is sometimes called, is descriptive of its faculty of sucking

PETROMYZON.

or adhering to stones and other substances, which it does with such tenacity as not to be drawn off without difficulty. A lamprey of three pounds weight has been known to raise a stone of twelve pounds, when seized hold of by the hand. This amazing power of suction must arise from the animal's exhausting the air within its body by the hole over the nose; while the mouth is closely fixed to the object, and permits no air to enter. The weight which the lamprey is by this means able to sustain will be equal to that of a column of air of the same circumference with the animal's mouth.

The lamprey sometimes grows so large, as to weigh four or five pounds; its colour is dusky, irregularly marked with dirty yellow. In the mouth are placed twenty rows of small teeth, disposed in circular orders, and placed far back near the throat, four, five, and six, in each row. The branchiæ are situated within the seven apertures, that are found on each side of the neck. Though in shape this animal resembles an eel, yet it is of a thicker and more clumsy form.

The sea lamprey, we should imagine from its name, was only produced in the salt water; it is traced, however, very frequently at the opening of large rivers, where they join the ocean. At certain seasons it is found in many of the British rivers, and also in the Irish. They are sea fishes; but, like salmon, quit the salt waters, and mount the rivers about the end of winter, and after remaining there for a few months, return again to the ocean.

As our manners are probably still far short of that sensuality and extravagance which distinguished the ancient Romans, we do not hear so many fanciful encomiums on particular fishes, nor such enormous sums paid to procure them. Accordingly, the lamprey known among us has obtained no very extraordinary character. It is differently estimated, according to the season in which it is taken, or the place where it is fed. The best season for them is the months of March, April and May; for they are more firm immediately on their arrival in the rivers from the salt water than afterwards. Towards the summer, and in the hot weather, when they have deposited their spawn, they are observed to be much wasted; and their flesh becomes flabby. Those caught in several of the rivers in Ireland the people will not venture to touch; and throughout the whole of Scotland they are held in detestation: while those taken by the English in the Severn are considered as the most delicate of all fishes whatever.

At a very early period, we find, the lamprey was reckoned a great delicacy by the English: that they are a heavy surfeiting food, the experience of one of our monarchs has fatally testified; for the death of Henry I. was occasioned by eating too plentiful a meal of these fishes. Notwithstanding this accident, they seem to have continued in high esteem long afterwards, for we find Henry IV. granting protection to such ships as brought over lampreys

for the table of his royal consort; and his successor issuing out a warrant to William of Nantes, for supplying him and his army with these fishes, wherever they might happen to march.

In proof of the ancient predilection of the English for this fish, it is a custom, from time immemorial, for the city of Gloucester to present annually his majesty with a lamprey pye, covered with a large raised crust. As the gift is made at Christmas, it is with great difficulty the corporation can procure any fresh lampreys at that early season, though they offer a sum far exceeding their usual price.

The fishes of this genus, from some peculiarity in their conformation, generally swim with their body on a level with the surface of the water; and, it is said, can easily be suffocated, by being immersed in it for any considerable time. From this circumstance, it is probable that they require a frequent supply of air for breathing, and they may fairly be regarded as amphibious.

The female, when ready to spawn, digs a hole in the mud, where she deposits her ova; and in this operation, the power of suction, which we have already described, is of singular advantage; for, should she meet with a stone, though of considerable bulk, she raises and carries it out of the way. After the ova are excluded, and buried in the excavation thus formed, the parent remains in the neighbourhood till the young are quickened into life. She is then seen, with her numerous family playing around her; which, as soon as they have acquired sufficient strength, she gradually conducts to the sea.

2. *P. fluviatilis*. Lesser, or river lamprey. Second dorsal fin angulate.

This species is smaller than the former, seldom exceeding fourteen inches in length, and is also distinguished by transverse lines of a blackish colour. The mouth is of the same round form as in the preceding, and is possessed of the same adhesive power. On the upper part of it is a large bifurcated tooth; on each side there are three rows of very minute ones; and on the lower part there are seven, the exterior of which on each side is the largest; body above blackish, varied at the sides, whitish beneath.

Like all the other fishes of this genus, there is between the eyes a spout-hole or orifice, resembling that of the cetaceous fishes, and probably destined for a similar purpose, that of ejecting water from the throat and lungs. The back fin of the river lamprey is not continued uninterrupted to the tail, but is broken off; and behind it there rises a second, which goes round the tail, terminating at the anus.

This species, as well as the larger kind, is also eaten, potted and highly seasoned: by some it is preferred to the sea lamprey, as being milder tasted. All these fishes are probably heavy and unwholesome; and rather recommended by the epicure than the physician. They are taken in such vast numbers in the Thames, the Severn, and the Dee, that they constitute

a considerable branch of trade. They are sold to the Dutch, who use them for bait in the cod fishery: besides what are consumed in England, 450,000 have been exported in a season for this purpose, at two pounds per thousand. This species is also found in Japan and the lakes of South America

3. *P. brancialis*. Pride. Lampren. Second dorsal fin linear: mouth lobate.

This species is exceedingly small, being only from six to eight inches long. It is a British fish, but found also in the rivers of Germany and Italy. In the river Isis, and other streams near Oxford, they are abundant, where, instead of concealing themselves, they roll in the mud, and never are observed to adhere to the stones, like the other lampreys.

The back is of a livid colour, approaching to black; the belly silvery, and more resplendent than the larger kinds. The mouth is of an elliptical shape; within it are six or seven teeth, and above them a small semicircular bone. Upon the top of the head is a small tube, or aperture, like the cetaceous fishes: the belly swells and contracts alternately, as in those animals which breathe by means of lungs. It has two dorsal fins; the first rising about the middle, and supported by small tendons, that are scarcely visible; the other takes its rise immediately behind it, surrounds the tail, and terminates in the middle space, between the tail and the anus.

4. *P. planeri*. Planer's lamprey. Body annulate; mouth papillous: teeth in a single row, with others close behind them; breast thicker than in the others. Inhabits the fresh water rivers of Thuringia and other parts of Germany.

PETRONIUS. The most celebrated of this name is a great favourite of the emperor Nero, and one of the ministers and associates of all his pleasures and his debauchery. Hewas naturally fond of pleasure, and effeminate, and passed his whole nights in revels and the days in sleep. He was affable in his behaviour, and his witticisms and satirical remarks appeared artless and natural. He was appointed proconsul of Bithynia, and afterwards consul, in both of which employments he behaved with all the dignity becoming the successors of a Brutus or a Scipio, but with his office he laid down his artificial gravity, and again gave himself up to the pursuits of pleasure. He did not long enjoy the imperial favours. Tigellinus, likewise one of Nero's favourites, jealous of his fame, accused him of conspiring against the emperor's life. The accusation was credited, and Petronius withdrew himself from Nero's punishments by a voluntary death. This was performed in a manner altogether unprecedented, A. D. 66. Petronius ordered his veins to be opened, but had them closed at intervals, until at last nature was exhausted. Petronius distinguished himself by his writings as well as by his luxury and voluptuousness. He is the author of many elegant but obscene compositions still extant, among which is a poem on the civil wars of Pompey and Cæsar.

There is also the feast of Trimalcion, in which he paints the pleasures and the debaucheries of a corrupted court and monarch, &c. The best editions of this classic are those of Burman at Utrecht, in 1709, and 1743; and that of Antonius at Leipsic, in 1783, with an excellent preface and several erudite notes.

PETRO-SALPINGO-STAPHILINUS, in myology. See **LEVATOR PALATI**.

PETROSELINUM. (from *παρα*, a rock, and *ωσινον*, parsley.) Common parsley. The **APIUM PETROSELINUM** of Linnæus, which see.

PETROSILEX, in mineralogy, a genus of the class earths, order siliceous. Consisting of the greater part silica, about 22 per cent of alumina, and 6 per cent of carbonat of lime; hardish, lightish; found in primæval stratified mountains, without lustre, breaking into indeterminate fragments, of a splintery texture; melting before the blow-pipe. Three species.

1. *P. apacus*. Hornstone. Chert. Nearly opaque, of a common form: sometimes with a texture resembling small splinters; sometimes with the colours alternating in strata; sometimes with a texture resembling larger splinters; sometimes of a greenish colour. Found in Sweden and Germany, forming veins and beds of mountains, and frequently in nodules like kernels in rocks; colour usually blue-grey, sometimes grey, blue and green of various shades; by breathing on it discovers an earthy smell, and is sometimes so hard as to strike fire with steel; it decomposes sooner than flint, and does not take so high a polish: in the fire it decrepitates and whitens: specific gravity from 2,699 to 2,708: contains,

Silica	-	-	-	72
Alumina	-	-	-	22
Carbonat of lime	-	-	-	6

100 *Kirwan.*

2. *P. diaphanus*. Semipellucid petrosilex. Silix petrosilex. Found with the last species; colour grey, white, ochraceous, rosy, flesh-colour, brownish-red, yellowish or reddish-brown, green or variegated: often receives a fine polish.

3. *P. crystallinus*. In rough crystals, which are frequently hollow within. These are of many varieties.

- a. In six-sided perfect prisms.
6. Six-sided prisms, terminated on each side by convex surfaces.
7. Six-sided prisms, terminated on each side by a three-sided pyramid.
8. Cubes.
- i. Six-sided tables.
- ç. Double four-sided pyramids.
- η. Double three-sided pyramids.
- θ. Double three-sided depressed pyramids.
- ι. Single three-sided minute pointed pyramids.

Found in Saxony near Schneeberg, sometimes covered with a thin earthy coating.

PETTAPOLLY, a seaport of Hindustan, on the coast of Coromandel, where the Dutch

have a factory, 42 miles S.W. of Masulipatam. Lon. 80 46 E. Lat. 15. 49 N.

PETTAW, a town of Austria, in the duchy of Suria. It belongs to the bishop of Saltsburg, and is seated on the Drave, 28 miles S. by E. of Gratz. Lon. 15. 37 E. Lat. 46. 46 N.

PETTEIA, in music, the last of the three parts into which the melopœia of the ancients was subdivided.

PETTICOAT. *s.* (*petit* and *coat.*) The lower part of a woman's dress (*Suckling*).

PETTIFOGGER. *s.* (corrupted from *petitoguer*; *petit* and *voguer*, French.) A petty small-rate lawyer (*Swift*).

PETTINESS. *s.* (from *petty*.) Smallness; inconsiderableness; unimportance (*Shakspeare*).

PETTISH. *a.* (from *pet.*) Fretful; peevish (*Creech*).

PETTISHNESS. *s.* (from *pettish.*) Fretfulness; peevishness (*Collier*).

PETTITOES. *s.* (*petty* and *toe.*) 1. The feet of a sucking pig. 2. Feet in contempt (*Shakspeare*).

PETTO. *s.* (Italian.) The breast; figuratively, privacy.

PETTY. *a.* (*petit*, French.) Small; inconsiderable; inferior; little (*Stillington*).

PETTY WHIM, in botany. See GENISTA.

PETTY (Sir William), son of Anthony Petty a clothier, was born at Rumsey, a little haven-town in Hampshire, in 1623; and while a boy took great delight in spending his time among the artificers there, whose trades he could work at when but twelve years of age. Then he went to the grammar-school there: at 15 he was master of the Latin, Greek, and French tongues, and of arithmetic and those parts of practical geometry and astronomy useful in navigation. Soon after he went to Caen in Normandy, and Paris, where he studied anatomy, and read Vesalius with Mr. Hobbes. Upon his return to England he was preferred in the king's navy. In 1643, when the war between the king and parliament grew hot, he went into the Netherlands and France for three years; and having vigorously prosecuted his studies, especially in physic, at Utrecht, Leyden, Amsterdam, and Paris, he returned home to Rumsey. In 1647, he obtained a patent to teach the art of double writing for seventeen years. In 1648, he published at London, Advice to Mr. Samuel Hartlib, for the Advancement of some particular Parts of Learning. At this time he adhered to the prevailing party of the kingdom; and went to Oxford, where he taught anatomy and chemistry, and was created a doctor of physic. In 1650, he was made professor of anatomy there, and soon after a member of the college of physicians in London. The same year he became physician to the army in Ireland; where he continued till 1659, and acquired a great fortune. After the Restoration, he was introduced to king Charles II. who knighted him in 1661. In 1662, he published A Treatise of

Taxes and Contributions. Next year he was greatly applauded in Ireland for his invention of a double-bottomed ship. He died at London of a gangrene in the foot, occasioned by the swelling of the gout, in 1687.

The character of his genius is sufficiently seen in his writings, which were much more numerous than those we have mentioned above. Amongst these, it is said, he wrote the history of his own life, which unquestionably contained a full account of his political and religious principles, as may be conjectured from what he has left us upon those subjects in his will. In that he has these remarkable words: "As for legacies to the poor, I am at a stand; and for beggars by trade and election, I give them nothing: as for impotents by the hand of God, the public ought to maintain them: as for those who can get no work, the magistrates should cause them to be employed; which may be well done in Ireland, where are fifteen acres of improveable land for every head: as for prisoners for crimes by the king, or for debt by their prosecutors, those who compassionate the sufferings of any object, let them relieve themselves by relieving such sufferers; that is, give them alms, &c. I am contented, that I have assisted all my poor relations, and put many into a way of getting their own bread, and have laboured in public works and inventions, and have sought out real objects of charity; and do hereby conjure all who partake of my estate, from time to time to do the same at their peril. Nevertheless, to answer custom, and to take the sure side, I give twenty pounds to the most wanting of the parish wherein I die." As for his religion, he says, "I die in the profession of that faith, and in the practice of such worship, as I find established by the laws of my country; not being able to believe what I myself please, nor to worship God better than by doing as I would be done unto, and observing the laws of my country, and expressing my love and honour to Almighty God, by such signs and tokens as are understood to be such by the people with whom I live." He died possessed of a very large fortune, as appears by his will; where he makes his real estate about 6500*l.* per annum, his personal estate about 45,000*l.* his bad and desperate debts 30,000*l.* and the demonstrable improvements of his Irish estate, 4000*l.* per annum; in all, at six per cent interest, 15,000*l.* per annum. This estate came to his family, who were afterwards ennobled. The present marquis of Lansdowne is a lineal descendant.

The great variety of topics on which sir William wrote successfully, prove the extent and fertility of his genius. A complete list of his works is given in Dr. Hutton's Mathematical and Philosophical Dictionary, to which we beg to refer the curious reader.

PETTY BAG, an office in Chancery, the three clerks of which record the return of all inquisitions out of every county, and make all patents of comptrollers, gaugers, customers, &c.

PETTY-CHAPS, in ornithology. See **MO-TACILLA**.

PETTY-FOGGER, a low tricking attorney, without either skill or conscience.

PETTY or **PETIT LARCENY**. See **LARCENY**.

PETTY or **PETIT TREASON**. See **TREASON**.

PETULANCE. **PE'TULANCY**. *s.* (*petulance*, French; *petulantia*, Latin.) Sauciness; peevishness; wantonness (*Clarendon*).

PETULANT. *a.* (*petulans*, Latin; *petulant*, French.) 1. Saucy; perverse (*Watts*). 2. Wanton (*Spectator*).

PETULANTLY. *ad.* (from *petulant*.) With petulance; with saucy pertness.

PETUNSE, in the arts, one of the principal substances made use of in the manufacture of porcelain: the other is kaolin. Petunse consists of

Silex	74
Alumina	14.5
Lime	5.5
	94.0

Kaolin consists of

Silex	74
Alumina	16.5
Lime	2
Water	7
	99.5

Therefore the two together consist of silex and alumina, with less than 5 per cent of lime. See **PORCELAIN**.

PETWORTH, a town in Sussex, with a market on Saturday; seated near the Arun, 12 miles N.E. of Chichester, and 49 S.W. of London. Lon. 0. 34 W. Lat. 50. 58 N.

PEUCEDANUM. Sulphur-wort. Meadow-saxifrage. In botany, a genus of the class pentandria, order digynia. Fruit ovate, striate on both sides, surrounded with a membrane; calyx five-parted; involucre very short; florets of the center abortive. Eleven species: for the most part natives of warm climates; two indigenous to our country, as follows.

1. *P. Silaus*. Common meadow saxifrage. Leaflets pinnatifid, with opposite decurrent segments; general involucre about two-leaved. Found wild in our meadows, and employed occasionally in medicine under the name of **SAXIFRAGA VULGARIS**, which see.

2. *P. officinale*, called by some medical writers *marathrum sylvestre*, *marathrophyllum*, or *pinastellum*. Hog's-fennel; horse-tongue; common sulphur-wort. Leaves five-times three-parted, with linear, undivided segments. Found wild in our ditches. The root is the official part; it has a strong fetid smell, somewhat resembling that of sulphureous solutions, and an acrid, unctuous, bitterish taste. Wounded when fresh in the spring or autumn, particularly in the former season, in which the root is most vigorous, it yields a considerable

quantity of yellow juice, which soon dries into a solid gummy resin, which retains the taste and strong smell of the root. This, as well as the root, is recommended as a nervine and anti-hysterical remedy.

PEUCESTES, a Macedonian, set over Egypt, by Alexander. He received Persia at the general division of the Macedonian empire at the king's death, and behaved with great cowardice after he had joined himself to Eumenes.

PEUCETIA, a part of Italy, near Campania, called also Mesapia and Calabria. It received its name from Peucetus, the son of Lycon, of Arcadia.

PEVENSEY, a village in Sussex, situate on a small river, which runs into a bay of the English Channel, called Pevensy Harbour, 14 miles W.S.W. of Hastings. Here is an ancient castle, which belonged to Robert earl of Moreton, and is said to be the largest and most entire remain of Roman building to be seen in Britain. Pevensy was anciently a famous haven, though now it is nearly two miles from the sea. Here Swain landed in 1049, when he carried off his cousin Beorn and murdered him: Godwin, and his son Harold, afterward ravaged it, and took away many ships: and here William the Conqueror landed when he invaded England.

PEW. *s.* (*puye*, Dutch.) A seat enclosed in a church (*Addison*).

PEWIT, in ornithology. See **TRINGA**.

PEWTER, a factitious metal, used in making domestic utensils, as plates, dishes, &c. The basis of this metal is tin, which is converted into pewter, by mixing at the rate of an hundred weight of tin, with fifteen pounds of lead, and six pounds of brass. Besides this composition, which makes the common pewter, there are other kinds compounded of tin, regulus of antimony, bismuth and copper, in several proportions. See **ZINCUM**.

PEWTERER, one who works in pewter.

PEYRERE (Isaac), librarian to the prince of Condé, and author of *Præadamitæ*, &c. a book condemned to the flames, and causing its writer to be imprisoned at Brussels. He was, however, released through the interest of the prince, and after some time retired to the Seminaire des Vertus, where he died, in 1676, aged 84.

PEZAY (Masson, marquis of), a native of Paris, and instructor in the art of tactics to Louis XVI. He was afterwards appointed inspector-general to the coasts, but dismissed and banished to his own estates for reasons not publicly known. He wrote *Les Soirées Helvétiennes*, with several other poems, as also *Les Campagnes de Maillebois*. He died in 1778.

PEZENAS (Esprit), a learned jesuit, of Avignon, in 1692, and some time professor of physic at Marseilles. His works and translations are numerous, and esteemed for the perspicuity of the language.

PEZIZA. Cap-mushroom. In botany, a

genus of the class cryptogamia, order fungi. Fungus concave, hæmispherical, or campanulate, without visible fructification. Seventy-two species, of which fifty-six are indigenous to our own country. They may be thus subarranged.

A. Sessile.

B. On a stalk, containing the larger number.

C. Gelatinous.

PEZRON (Paul), a very learned and ingenious Frenchman, born at Hennebon in Brittany in 1639, and admitted into the order of Citeaux in 1660. He was a great antiquary, and was indefatigable in tracing the origin of the language of the Goths; the result of which was, that he was led to espouse a system of the world's being much more ancient than modern chronologers have supposed. This he communicated to the public in a treatise printed at Paris in 1687, 4to, entitled, *The antiquity of Time restored*, and defended against the Jews and modern chronologers. This book of Pezron's was extremely admired for the ingenuity and learning in it; yet caused no small alarm among the religious, against whom he nevertheless defended his opinions. He went through several promotions, the last of which was to the abbey of Charmoye, to which he was nominated by the king; and died in 1706.

PPAFENHOFEN, a town of Upper Bavaria, with a Benedictine monastery at a small distance. It is seated on the Ilm, 19 miles N.W. of Ratisbon. Lon. 12. 3 E. Lat. 49. 27 N.

PFIRT, or FORETTE, a town of France, in the department of Upper Rhine, 10 miles W. of Basil. Lon. 7. 20 E. Lat. 47. 37 N.

PFORTZHEIM, a town of Suabia, in the marquisate of Baden-Durlach, with a castle, seated on the Entz, 15 miles S.E. of Durlach. Lon. 9. 46 E. Lat. 48. 57 N.

PFREIMB, a town of Upper Bavaria, with a castle, seated at the confluence of the Pfreint and Nab, 10 miles N.E. of Amberg. Lon. 12. 21 E. Lat. 49. 21 N.

PFULLENDORF, an imperial town of Suabia, seated on the Andalspatch, 37 miles S.W. of Ulen. Lon. 9. 27 W. Lat. 48. 8 N.

PHACA, in botany, a genus of the class diadelphia, order decandria. Calyx five-toothed, the two upper teeth more remote; legume half-two-celled, inflated. Twelve species, natives of the south of Europe and of Asia.

PHÆACIA, an island of the Ionian sea, near the coast of Epirus, afterward Corcyra. The inhabitants were a luxurious people, from which reason a glutton was generally stigmatized by the epithet of Phæax. When Ulysses was shipwrecked on the coast of Phæacia, Alcinoüs was then king of the island.

PHÆDON. The most remarkable of this name is a disciple of Socrates. He had been seized by pirates in his younger days, and the philosopher, who seemed to discover something

uncommon and promising in his countenance, purchased his liberty, and ever after esteemed him. The name of Phædon is affixed to one of the dialogues of Plato.

PHÆDRA, a daughter of Minos and Pasiphae, who married Theseus, by whom she became mother of Acamas and Demophoon. She conceived an unconquerable passion for Hippolytus, the son of Theseus, by the amazon Hippolyte. Phædra long attempted to stifle it, but in vain, and in the absence of Theseus, she addressed Hippolytus. Hippolytus rejected her with horror. Phædra, incensed on account of the reception she had met, at the return of Theseus, accused Hippolytus of attempts upon her virtue. The credulous father listened to the accusation, and without hearing the defence of Hippolytus, banished him, to punish him in some exemplary manner. As Hippolytus fled from Athens; his horses were suddenly terrified by a sea monster, which Neptune had sent on the shore. He was dragged through precipices and over rocks, trampled under his horses, and crushed under the wheels of his chariot. When the tragical end of Hippolytus was known at Athens, Phædra confessed her crime, and hanged herself in despair.

PHÆDRUS, the author of five books of Latin Fables in Iambic verse. He was a Thracian by birth, and contemporary with Julius Cæsar. He lived to be very old, and his being called Augustus's freedman shows that he had been a slave to that emperor. Under Tiberius he was unjustly persecuted by Sejanus, to which circumstance he has alluded in his Fables, and particularly in the preface to his third book. It is somewhat singular that the Roman language has been transmitted to posterity in its greatest purity and elegance by two slaves, who were brought from countries deemed barbarous: and it is no less remarkable that the Fables of Phædrus should remain buried in libraries unknown to the public, until discovered by Pithon, a learned Frenchman, at the close of the 16th century.

PHÆNOMENON. *s.* See PHENOMENON. This has sometimes *phænomena* in the plural. (φαινόμενον.) An appearance in the works of nature (*Newton*).

PHAETHUSA, in botany, a genus of the class syngenesia, order polygamia superflua. Receptacle chaffy; downless; seeds bristly; calyx imbricate; florets of the ray from one to three. One species, a North American tree eighteen feet high.

PHAETON, in fabulous history, a son of the Sun, or Phœbus and Clymene, one of the Oceanides, according to Ovid. Venus became enamoured of him, and entrusted him with the care of one of her temples. This favour of the goddess rendered him vain, and when Epaphus, the son of Io, had told him, to check his pride, that he was not the son of Phœbus, Phaeton resolved to know his true origin, and he visited the palace of the sun. He begged Phœbus, if he really were his father, to give him incontestable proofs of his

tenderness, and convince the world of his legitimacy. Phœbus swore by the Styx, that he would grant him whatever he required; and no sooner was the oath uttered, than Phaeton requested to drive his chariot for one day. Phœbus represented the dangers to which this would expose him, but in vain. He undertook the aerial journey, and the explicit directions of his father were forgotten. No sooner had Phaeton received the reins, than he betrayed his ignorance of guiding the chariot. The flying horses became sensible of the confusion of their driver, and immediately departed from the usual track. Phaeton repented too late of his rashness, and already heaven and earth were threatened with an universal conflagration, when Jupiter, who had perceived the disorder of the horses, struck the rider with a thunder-bolt, and hurled him headlong from heaven into the river Po. His body, consumed with the fire, was found by the nymphs of the place, and honoured with a decent burial. His sisters mourned his unhappy end, and were changed into poplars by Jupiter.

PHAETON, in ornithology, tropic-bird; a genus of the order anseres. Bill sharp-edged, straight, pointed, the gape of the mouth reaching beyond; nostrils oblong; hind-toe turned forward. Three species, as follow:

1. *P. æthereus*. Common tropic-bird. Body white; back, rump, and less wing-feathers streaked with white; two middle tail-feathers black at the base; bill red.

There are two other varieties, from a slight variation in the colours.

Inhabits the tropics, and are often seen upon the backs of porpoises; seldom on land, except in breeding time: about two feet ten inches long; flies very high; and feeds on fishes.

2. *P. melanorhynchus*. Black-billed tropic-bird. Streaked black and white, beneath white; bill black; quill-feathers tipped with white, tail-feathers with black. Inhabits Palmerston and Turtle Islands: nineteen and a half inches long.

3. *P. phœnicurus*. Red-tailed tropic-bird. Rosy flesh-colour; bill and two middle tail-feathers red. Inhabits Mauritius Island: two feet ten inches long, of which the two middle tail-feathers measure one foot nine inches; builds in hollows in the ground, under trees; and lays two yellowish-white eggs with rufous spots.

PHAETONTIADES or **PHAETONTIDES**, the sisters of Phaeton, who were changed into poplars by Jupiter.

PHAETUSA, one of the Heliades, changed into poplars after the death of their brother Phaeton.

PHAGEDE'NA. *s.* (*φαιγδαίνα*; from *φαγω*, to eat.) An ulcer, where the sharpness of the humours eats away the flesh.

PHAGEDENIC. **PHAGEDE'NOUS**. *s.* (*phagedenique*, Fr.) Eating; corroding (*Wise-man*).

PHALÆNA. Moth. In zoology, a genus

of the class insecta, order lepidoptera. Antennas gradually tapering from the base to the tip; tongue spiral; jawless; wings when at rest, generally deflected; flight nocturnal. Sixteen hundred species. These fly abroad only in the evening and during the night, and feed on the nectar of flowers: the larve is active and quick in motion, mostly smooth, more or less cylindrical, and preys voraciously on the leaves of various plants: pupa quiescent, more or less cylindrical, pointed at the tip or at both ends, and is generally inclosed in a follicle. They are divided into the following sections:

A. *bombyx*. Antennas filiform; feelers two, compressed, reflected; tongue short, membranaceous, obtuse, bifid; larve sixteen-footed, often hairy; pupa pointed at the tip. These are subdivided again:

α Wings expanded.

ς Wings reversed.

γ Wings deflected.

δ Wings incumbent.

ε Wings convolute.

B. *geometra*. Antennas filiform; feelers cylindrical; tongue projected, membranaceous, setaceous, bifid; larve eight or ten-footed; six of the feet pectoral, two caudal, and sometimes two subcaudal; pupa pointed at the tip. Thus again subdivided:

α Antennas pectinate.

ς Antennas setaceous.

γ Wings forked, connivent.

C. *noctua*. Antennas setaceous; feelers compressed, hairy, the tip cylindrical and naked; tongue projecting, horny, setaceous, bifid; larve sixteen-footed; pupa pointed at the tip. Subdivided as follows:

α Wings expanded.

ς Wings flat, incumbent; thorax smooth.

γ Wings flat, incumbent; thorax crested.

δ Wings deflected; thorax smooth.

ε Wings deflected; thorax crested.

D. *hyblœa*. Antennas setaceous; feelers projecting, compressed, dilated in the middle; lip projecting, acute.

E. *hepialus*. Antennas moniliform; feelers two, reflected, hairy, between them is the rudiment of a bifid tongue; larve sixteen-footed, that feed on the roots of plants; pupa folliculate, cylindrical, and pointed at the tip.

F. *cossus*. Antennas short, filiform; feelers two, very short, cylindrical, reflected; without spiral tongue.

G. *pyralis*. Antennas filiform; feelers two, equal, almost naked, cylindrical at the base, the middle dilated into an oval, and subulate at the tip; tongue projected, setaceous, bifid; wings very obtuse, and slightly curved at the exterior margin; larve sixteen-footed, rolling up the leaves to which it attaches itself.

H. *tinæa*. Antennas setaceous; feelers four, unequal; larve found in houses, among linen and woollen cloths and fur-

PHALÆNA.

niture, in which it eats holes and to which it is very destructive.

1. *allucita*. Antennas setaceous; feelers two, divided to the middle, the inner division very acute.

K. *pterophorus*. Antennas setaceous; feelers two, linear, naked; tongue exserted, membranaceous, bifid; wings fan-shaped, divided down to the base, and generally subdivided as far as the middle; larve sixteen-footed, ovate, hairy; pupæ naked, subulate at the tip.

The greater part of this numerous tribe, when at liberty in the fields, only fly during the night, or towards the evening: when domesticated in boxes made for that purpose, they give indications by their fluttering within when the natural period of their activity approaches. During the day they remain quiet, and apparently reconciled to their confinement; they flutter throughout the whole extent of their prisons towards the close of day, and testify their impatience at their want of freedom.

All the butterflies are provided with a rostrum for gathering, and for the reception of their food; a great part of the moths are entirely destitute of such an organ, while in others it is so small as scarcely to be discernible with the naked eye. This singular fact hath been fully investigated by the indefatigable Reaumur, who, after examining many moths with a strong magnifier, has not been able to trace the smallest vestige of a mouth. A considerable number, therefore, of these animals must pass the whole of their winged state without food; nor can they be destructive to vegetable or animal substances, except while they remain in the form of worms.

The larvæ or caterpillars from which the various species of moths are produced, exhibit nearly the same variety of appearance as the winged insects which spring from them. Some are large, while others are extremely minute; many are provided with ten, others twelve and fourteen feet; the largest and most common have sixteen. Some of the smaller caterpillars are smooth, and others covered with hairs, which produce an itching and an inflammation when they touch the human skin.

All the caterpillars of phalænæ, after having several times cast their skin, spin for themselves the materials of a habitation, in which they are to be transformed into chrysalids. Of all the inventions of insects to protect themselves during this state of imbecility, that practised by the silk worm is most universally known; and if animals acquire a consequence or reputation from their connection with man, and the conveniences with which they accommodate him, this insect may challenge, perhaps, a larger share of it than any other animal whatever. Our luxury has brought silk into such general request, that it may now be deemed a necessary of life: the poor, in some countries at least, would find it almost impossible to procure the necessary articles of clothing, were woollen

stuffs worn by all those who at present are supplied with silk.

The produce of the phalænæ mori, or common silk worm, has been found most proper for the purpose of manufacturing. That glutinous substance with which the silk of this species is always covered when it first comes from the worm, and which gives it that adhesive quality so proper for constructing their edifices, sooner dries than in that of any other insect. The cods constructed by some other species are so firmly glued together, that no operation can separate the threads. The produce of many is by far too fine for any purpose in our manufactures, while that of another class is too coarse.

Several very laudable attempts have been made, but hitherto without any considerable degree of success, to rear the silk worm in Britain. The public have lately been informed by a manufacturer of Paisley of his having prepared a web entirely of the silk produced by worms of his own rearing. And in the transactions of the society for the encouragement of arts, manufactures, and commerce, a number of very useful experiments are recorded with regard to the food and management of these insects.

Probably the want of a sufficient number of mulberry trees has hitherto rendered ineffectual the efforts of our countrymen to introduce and rear any considerable quantity of silk worms. From the attempts that have already been made, it appears that the white mulberry is preferable to the black in feeding, and that the latter is to be preferred to the lettuce. Twelve cocoons, the produce of worms fed upon the white mulberry, weighed seven penny-weights two grains; while an equal number of those that had been fed upon the black mulberry weighed only six penny-weights three grains: six penny-weights were obtained from the same number of worms fed upon common lettuce.

Endeavours to produce raw silk in our own country seem the more worthy of encouragement, as we appear to possess some advantages of which Italy and many other silk countries are destitute. In Italy the chrysalids so soon come to life, that it is necessary to destroy them, lest, by eating their way out, they should injure the silk. In order to effect this, they are collected and placed in heated ovens, where again the silk, without singular caution, is apt to be damaged. In our own climate, where every progression of the insect tribe is slower, there is sufficient time to wind off the silk without killing the chrysalis.

But beside the injury that may be done to the silk in Italy, from the length of time which it is necessary to keep the chrysalis in these ovens, they are there obliged to suffer the moth to eat its way out of the largest cones, in order to have eggs from the most vigorous and healthy. Hence they lose all the silk of these cones, which, in our own country, might be gathered while the moths are preserved. Thus we seem to possess two striking advantages,

PHALÆNA.

which may probably compensate for the want of others which our climate has denied us.

Yet our climate itself is in some respects superior to those where silk is raised. In the south of France the frosts are often so intense as to kill the mulberry leaves after they are out. At that season of the year, this is seldom the case in England; which is also more free from lightning, and those sultry heats that have always been deemed prejudicial to the silk worm. From such considerations the time may perhaps arrive when our countrymen, by farther knowledge and experience, may be enabled to avail themselves of these exclusive advantages, and become entitled to a rank as distinguished among the raisers, as that which they have long held among the manufacturers of silk.

The silk worm, however, is far from being the only insect of whose labours man might probably avail himself. There are many species very common, and immensely fertile, that might be beneficially employed in procuring silk, did we know how to profit of their labours. M. de Reaumur has mentioned several whose productions deserve a trial, although we are aware that the silk of many of them is altogether unfit for our purposes; their coques being not only coarse, but so scantily provided with silk, that the animal is obliged to join dry leaves, bits of wood, and other materials, in order to give stability to its edifice. Some of them indeed spin under ground, and their work consists only of joining and connecting together, by means of their threads, different particles of earth, of which their house is composed. These caterpillars, when kept by the naturalist, who waits for their perfect form, must be supplied with earth in the boxes in which they are lodged; otherwise they will perish, from not being able to construct an edifice fit for their reception.

The moths differ from the butterflies in remaining in their chrysalid state for a much longer period before their metamorphoses into perfect insects is completed. Their form, too, is then different, being oblong, and not angular, like the chrysalid of the butterfly. Some remain in their coques for several years successively; especially if a cold damp situation have retarded their progress. So great is the effect of heat in precipitating their developements, that a moth in a warm exposure may be produced from its chrysalid, even in the depth of winter.

After the phalænæ issue from their last covering, some of them are destitute of wings: these are the females of certain kinds, who, instead of wings, have only short protuberances, altogether unfit for the purpose of flying. They have the appearance of large creeping animals of a different order, and can only be recognised for moths by the shape of their antennæ, which are similar to those of the males, and by those scales with which the body of these animals is covered.

Though the moths do not in general fly by

day, yet it is the light which, at evening, attracts them into the dwellings of man: then it is that they are seen entering the rooms, and fluttering around the candles, where they often meet with a painful death. This fondness for light has suggested to the curious a method of catching moths, by carrying a lantern into a bower, around which they all flock, when the greater part may be led into captivity.

Out of this almost innumerable tribe of insects we can select but a few specimens.

1. *P. mori*. Common silk worm. Wings pale, with three obsolete brown streaks. We have already made some observations on the produce of this curious moth, and have now only to remark that, in its native state, it inhabits China, on the mulberry tree, whence its specific name, and was introduced into Europe in the reign of the emperor Justinian: it is the fine silky threads which compose the follicle of the pupæ, that are converted into that valuable article of commerce and luxury, in our own country denominated silk. This species belongs to the partition bombyx: the larvæ is characterised by having the tail naked and whitish; the pupæ is folliculate, reddish-brown.

2. *P. atlas*. Wings foliate, varied with yellow, white, and ferruginous, with a transparent spot on each, that on the upper pair with a contiguous smaller one. This is the largest and most splendid of all the phalænæ yet known: the extent of its wings measures not less than eight inches and a half. It is a native of both the Indies; and occasionally varies in size and colours. It belongs to the partition bombyx: the larvæ is verticillate with hairy tubercles, and spins a web of very strong yellowish silk.

3. *P. luna*. Wings tailed, both surfaces alike; colour elegant peagreen, with a transparent lunule eye on each wing; the upper wings have a dark-brown rib which extends across the thorax; body covered with white wool. It inhabits North America.

4. *P. pavonia*. Wings rounded, clouded with grey and barred with grey beneath, each of them with a nictitant semitransparent eye. The most beautiful European insect of the bombyx partition: its wings, when extended, measure about six inches. It is subject to several varieties in its size, and the disposition of its markings; the larvæ is gregarious and green, verticillate with red or yellow, hairy protuberances; pupæ blackish, folliculate, with an elastic aperture at the rib. It is occasionally found in our own country.

5. *P. sambucaria*. Wings tailed, angular, yellowish with two darker streaks; lower ones with two reddish dots at the tip. It is an elegant moth, of a pale sulphur colour, found in June and July on the leaves of the elder tree, whence its specific name. Its chrysalis is black, and may be readily traced in the month of May in the same situation. It belongs to the partition geometra.

6. *P. vestianella*. Cloth-moth. Wings

cinereous with a white rib, the tips ascending and feathered. This insect belongs to the tineæ division, and is the common moth found in cloths and woollen furniture, and so destructive to them.

7. *P. sarcitella*. Wings cinereous, thorax with a white dot on each side. This also belongs to the division tineæ, and is found in skin-cloths and woollen furniture, to which; like the last, it proves terribly destructive.

These moths construct the abode in which they reside of the grains of wool or other materials, which they gnaw off. Their food is of the same substance; and what greatly increases the extent of their devastations is, that every step they advance upon cloth, feeling themselves incommoded by the wool in their way, they gnaw a smooth passage for themselves, like a man with a scythe in his hand, cutting down the grass of the meadow as he proceeds. Hence these species are among the most destructive of the tribe. The most costly articles of fur are those which are not worn every day; and for this very reason they are most exposed to their attacks. The methods for preventing their devastations may be reduced to the two following; either we must destroy the insects, or render our clothes disagreeable food for them. The insects may be destroyed by oil, or the fumes of tobacco; and the material may be rendered nauseous to them, and thus escape their ravage by having intermixed with them fragments of Russia leather or other skins, that emit and retain a strong animal odour; and it is probably on this account, though the odour is far less powerful, that this insect never commits its depredations on wool while on the back of the sheep.

8. *P. pentadactyla*. Body and wings snowy; upper pair bifid, lower ones three-parted. A very beautiful European species, a native of our own country and of other parts of Europe; size minute; the wing divided apparently into plumes, the upper by a delicate midrib consisting of two, the lower of three, with innumerable lateral fibres. The larve is sixteen-footed, hairy, green, with black dots, and a white dorsal line; pupæ hairy-green, dotted with black. This insect belongs to the division pterophorus, which constitutes a part of the alucia of Gmelin.

9. *P. hexadactyla*. Wings cleft, cinereous, spotted with brown, all of them six-parted. This also belongs to the division pterophorus: it inhabits England, and Europe generally, and is found on the *loriscera xylostium*, or honey-suckle; and is likewise a most elegant and beautiful insect. It often appears before our windows, and flies in, when they are open, in a still and warm evening in September. See Nat. Hist. Pl. CLXVI.

PHALANGES, in mastiology. See DELPHIS.

PHALANGIUM, in zoology, a genus of the class insecta, order aptera. Mouth with horny mandibles, the second joint with a very sharp, moveable, cheliferous tooth; feelers

filiform; antennae; eyes two on the crown and two at the sides; legs eight; abdomen generally rounded. These, in their various stages of transformation, prey on the smaller insects and worms: the larve and pupæ are active, eight-footed, and resemble the perfect insect. Nineteen species, thus subdivided:

A. Mouth with a conic tubular sucker.

a Feelers four, the upper one chelate.

This tribe constitutes the nymphon of Fabricius.

c Feelers two. The pycnogonum of Fabricius.

B. Mouth without a sucker.

a Feelers projecting, incurved. The phalangium of Fabricius.

c Feelers thick, spinous, and furnished with a claw at the tip.

The general form of this family of insects resembles that of the crab. Like the crab race, too, some of the species are terrestrial, and some aquatic, and they have all a wonderful power of shaking off a limb when entangled, and the whole animal is in danger. The following are chiefly worth notice.

1. *P. grossipes*. Body minute, cylindrical, glabrous; shoulders tuberculate; legs very long; body dirty-red, very minute and slow. Inhabits European seas; and insinuates itself into the shells of muscles, and destroys the fish.

2. *P. opilio*. Long-legged spider. Shepherd spider. Harvest spider. Abdomen ovate-grey, beneath whitish. Inhabits Europe and America, and wanders about by night; and is said by some naturalists, but perhaps erroneously, to be the insect that produces many of those gossamer threads with which the grass, stubble, and ground, are so thickly covered in the course of a single night in the autumn. The legs are uncommonly long and slender: when caught by one or them, the insect parts with it to save his body, and makes off without any apparent uneasiness; a faculty in which, as we have already observed, it resembles the crab and lobster, whose loss is quickly repaired by the growth of a new limb. No experiments, however, have yet ascertained whether the power of reproducing their limbs belong also to the insects of this genus.

3. *P. areoides*. Chelæ or claws toothed, villous; body oblong, soft, livid, woolly, with inflated claws. Inhabits the Cape of Good Hope, and the southern parts of Russia. Its bite is extremely poisonous, occasioning livid tumours, and sometimes death.

4. *P. cancröides*. Abdomen obovate, depressed, ferruginous; chelæ or claws oblong, hairy. Inhabits Europe in cellars and other damp places; and is the little insect that gets into our legs and under the skin in the summer season, causing a painful itching.

There is another variety with ovate chelæ, the scorpion *cimicoides* of Fabricius.

5. *P. acaroides*. Abdomen cylindrical, yellowish; chelæ ovate, smooth. Inhabits Ame-

rica: twice as large as *P. cancrroides*: and its bite said to be extremely painful and dangerous. See Nat. Hist. Pl. CLXIII.

PHALANGOSIS, in surgery, is a tumor and relaxation of the eye-lids, often so great as to deform the eye, and considerably to impede vision. Sometimes the eye-lid when in this state subsides or sinks down, occasioned perhaps either by a palsy of the muscle which sustains and elevates the eye-lid, or else from a relaxation of the cutis above, from various causes. Sometimes an oedematous or aqueous tumor is formed on the eye-lids, so as almost entirely to exclude vision.

PHALANX, in Grecian antiquity, a square battalion, consisting of 8000 men, with their shields joined, and pikes crossing each other, so that it was next to impossible to break it.

Hence phalanx is now often used to denote a troop of men closely embodied

PHALANX is employed by anatomists to the three rows of small bones which form the fingers. See **ANATOMY**, **FINGERS**, &c.

PHALARIS, a cruel tyrant of Agrigentum. Perillus made him a brazen bull, and when he had presented it to Phalaris, the tyrant ordered the inventor to be seized, and the first experiment to be made on his body. These cruelties did not long remain unrevenge; the people of Agrigentum revolted in the tenth year of his reign, and put him to death in the same manner as he had tortured Perillus, and many of his subjects. (*Ovid. Juv.*)

PHALARIS. Canary grass. In botany, a genus of the class triandria, order digynia. Calyx two-valved, one-flowered; carinate equal, longer than the corol. Eleven species: natives of India, the Cape, and south of Europe; three of them are common to our own road-sides or sandy fields. Of these *P. canariensis* is cultivated for the sake of its seeds, which are found to be the best food for canary and other small birds. It is found wild on our road-sides, with panicle awnless, ovate, spikeform; glumes of the calyx boat-shaped, entire: corol four-valved; the outer valves lanceolate, glabrous; inner villous.

PHALAROPE, in ornithology. See **TRINGA**.

PHALEUCIAN VERSE, in ancient poetry, a kind of verse which consists of five feet, the first of which is a spondee, the second a dactyl, and the three last trochees: such is the following one of Martial:

1 2 3 4 5
Summam | nec metu | as di | em, nec | optes.

PHALLICA, festivals observed by the Egyptians in honour of Osiris. They receive their name from φαλλος, *simulacrum ligneum membri virilis*. The institution originated in this: after the murder of Osiris, Isis, unable to recover the privities of her husband (see **OSIRIS**,) distinguished that which was lost with more honour than the parts recovered. Its representation, called phallus, was made of wood, and carried during the sacred festivals instituted in honour of Osiris. The people

looked upon it as the emblem of fecundity, and the mention of it among the ancients, it is said, though not very truly, we apprehend, never conveyed any impure thought or lascivious reflection. The festivals of the phallus were imitated by the Greeks, and introduced in Europe by the Athenians, who made the procession of the phallus part of the celebration of the Dionysia of the god of wine.

PHALLUS. Morel. In botany, a genus of the class cryptogamia, order fungi. Fungus reticulate above, even beneath; seeds in the reticulations.

Nine species, of which the three following are common to our own country.

1. *P. esculentus*. Esculent morel. Ovate, cellular, attached at the margin: plaits undulate, anastomosing. This species is found in woods, meadows, and pastures. The substance, when recent, is wax-like and friable, of a whitish-yellow colour, changing to brownish as it decays: the height of the entire fungus being four or five inches. The stalk is thick and clumsy, somewhat tuberous at the base and hollow in the middle. The pileus is either round or conical: at a medium about the size of an egg, often much larger; hollow within; its base united to the stalk, and its surface cellular or latticed with irregular sinuses. The seeds, when magnified, are oval. It is in great esteem, both recent and dried, as an ingredient to heighten the flavour of ragouts. Gleditch asserts that being observed to grow in abundance in the woods in Germany where charcoal has been made, the women who gather them for sale have long been accustomed to make fires in different parts of such woods, with heath, broom, vaccinium, and other materials, in order to obtain a more plentiful crop. From this practice, however, woods have often been set on fire to a considerable extent, and accompanied with great danger; in consequence of which the practice has of late been prohibited.

2. *P. impudicus*. Stinking morel. Stink-horns. Found in woods and on banks. It arises from the earth under a veil or volva, shaped exactly like a hen's egg, of the same colour, having a long fibrous radicle at its base. As the volva grows it bursts suddenly into several lacerated, permanent segments, from the centre of which arises an erect, white, cellular, hollow stalk, about five or six inches high, and one thick, of a wax-like friable substance, and most fetid cadaverous smell, conical at each end, the base inserted in a white, concave, membranaceous, turbinated cup, and the summit cupped with a hollow conic pileus. As soon as the volva bursts the plant begins to diffuse its intolerable stench, which is so powerful and widely expanded that the fungus may be discovered by the scent alone, long before it appears to the sight.

3. *P. caninus*. Dog-morel. Of an ovate form, with undulate plaits or segments, anastomosing with each other. Found also in woods and wild banks.

PHALLUS, in antiquity. See **PHALLICI**.

PHANATIC. See **FAN**.

PHANATIC, or **FANATIC**, a visionary; one who fancies he sees spectres, spirits, apparitions, or other imaginary objects, even when awake; and takes them to be real. Such are phrénetics, necromancers, hypochondriac persons, lycanthropi, &c. See **PHRENETIC**, **HYPOCHONDRIAC**, **LYCANTHROPI**. Hence the word is also applied to enthusiasts, pretenders to revelation, new lights, prophecies, &c.

PHANTASIA, a daughter of Nicarchus, of Memphis, in Egypt, supposed to have written a poem on the Trojan war, and another on the return of Ulysses to Ithaca, from which compositions Homer copied the greatest part of his Iliad and Odyssey, when he visited Memphis.

PHANTA'SM. **PHANTA'SMA**. *s.* (*φαντασμα, phantasma, phantasme, phantasie, Fr.*) Vain and airy appearance; something appearing only to imagination (*Raleigh*).

PHANTASMAGORIA, an appellation lately given to an exhibition of curious optical illusions in London. Though it will be difficult, we apprehend, to prove any exclusive property in phenomena that every experimental philosopher must have practised on a smaller scale, this has been the subject of a patent granted to Mr. Philipshall, of the Lyceum, in the Strand, who describes his method of representing, in a dark space or scene, human figures, in various characters, proportions, and sizes.

"The apparatus of some of these exhibitions," says he, "consists of two concave glasses, or rather two concave metal reflectors, before which an artificial light, proportionable to their focus, is applied.

"These enlightened concave metal reflectors are secured in a closet or box proportionable to their size, and their requisite light, in such a manner that all the rays of light are directed upon a transparent picture, representing the apparition; which picture reflects, by means of lenses, upon a transparent body, and giving the necessary direction to this apparatus, according to the nature of its circumstances, in such a manner that the apparitions represent themselves to the eye of the spectator arbitrarily, either in a larger or smaller, in a nearer or more distant perspective point of view.

"In the same manner I can likewise represent landscapes and buildings in a very striking and deceiving manner, in a voluntary size.

"Another sort of apparition is produced by the refraction of light, by means of transparent bodies, of various shapes and sizes, which are fixed in a dark closet as aforesaid, and, by means of the refraction of an artificial light, are either made visible or invisible. If those bodies are made to liken deceased persons which are required to be seen, then the apparition is the more striking, and answers fully the ideas commonly formed of a spectre.

"A third sort of these optical deceptions I produce in the following manner, viz. By opaque moveable figures of various sizes and

shapes. These are moderately enlightened by the refraction of a concave metal reflector, fixed in a dark closet; but the rays of light must be properly distributed by the refraction of a lens, of a proportionable focus, in order that the enlightened object may alone represent itself to the eye; if therefore, according to the description, the enlightened figures imitate mechanically the motions of men, and appear in proper dress or draperies, then this becomes the most striking illusion, as one may by this regulation, by giving an easy motion to their drapery, produce various groups, and pantomime scenes, out of the world of spirits.

"A fourth sort of optical illusion is operated in the following manner, in order to produce a multiplicity of apparitions. There is between the transparent body upon which the figures reflect, another dark body slipped in, upon which a fixed number of figures are applied, and are distributed in a symmetrical manner; upon these figures either a greater or less light is directed, according to the disposition of the groups, and gives to the apparatus the necessary direction, in order that those which reflect upon the transparent bodies may move through one another, and form all manner of groups; the positions of which are very comic and striking, and they procure the most agreeable entertainment." (*Rep. Arts. No. 95.*)

This specification, which, it must be confessed, is far from perspicuous, ought to have told, that the phantasmagoria consist of a striking application of the magic lantern. The novelty consists in placing the lantern on the opposite side of the screen which receives the images, instead of on the same side as the spectator, and suffering no light to appear, but what passes through and tends to form those images. Mr. P.'s sliders are therefore perfectly opaque, except that portion upon which the transparent figures are drawn, and the exhibition, as Mr. Nicholson informs us, is thus conducted.

All the lights of the small theatre of exhibition were removed, except one hanging lamp, which could be drawn up so that its flame should be perfectly enveloped in a cylindrical chimney, or opaque shade. In this gloomy and wavering light the curtain was drawn up, and presented to the spectator a cave or place exhibiting skeletons, and other figures of terror, in relief, and painted on the sides or walls. After a short interval the lamp was drawn up, and the audience were in total darkness, succeeded by thunder and lightning; which last appearance was formed by the magic lantern upon a thin cloth or screen, let down after the disappearance of the light, and consequently unknown to most of the spectators. These appearances were followed by figures of departed men, ghosts, skeletons, transmutations, &c. produced on the screen by the magic lantern on the other side, and moving their eyes, mouth, &c. by the well known contrivance of two or more sliders. The transformations are effected by moving the adjusting tube of the lantern out of its focus, and changing the

slider during the moment of the confused appearance.

It must be again remarked, that these figures appear without any surrounding circle of illumination, and that the spectators, having no previous view or knowledge of the screen, nor any visible object of comparison, are each left to imagine the distance according to their respective fancy. After a very short time of exhibiting the first figure, it was seen to contract gradually in all its dimensions, until it became extremely small and then vanished. This effect, as may easily be imagined, is produced by bringing the lantern nearer and nearer the screen, taking care at the same time to preserve the distinctness, and at last closing the aperture altogether: and the process being (except as to brightness) exactly the same as happens when visible objects become more remote, the mind is irresistibly led to consider the figures as if they were receding to an immense distance.

Several figures of celebrated men were thus exhibited with some transformations; such as the head of Dr. Franklin being converted into a skull, and these were succeeded by phantoms, skeletons, and various terrific figures, which instead of seeming to recede and then vanish, were (by enlargement) made suddenly to advance, to the surprise and astonishment of the audience, and then disappear by seeming to sink into the ground.

For another description of these interesting illusions, see the notes to Gregory's Translation of Haüy's Philosophy, vol. ii. page 390.

PHANTASTICAL. See **FANTASTICAL**.

PHANTACY. See **FANCY**.

PHANTOM. *s.* (*phantome*, Fr.) 1. A spectre; an apparition (*Atterbury*). 2. A fancied vision (*Rogers*).

PHAON, a boatman of Mitylene in Lesbos. He received a small box of ointment from Venus, with which, as soon as he rubbed himself, he became one of the most beautiful men of his age. Many were captivated with Phaon, and among others, Sappho, the celebrated poetess. Phaon gave himself up to Sappho's company, but however, he soon conceived a disdain for her, and Sappho, mortified at his coldness, threw herself into the sea.

PHARAMOND is the name which is given by the generality of historians to the first king of France. He is said to have reigned at Treves, and over a part of France, about the year 420; and to have been succeeded by his son Clodion: but the account which is given of these two princes is very uncertain. He is said to be the author of the famous Salique law, which forbade the succession of females.

PHARAOH, a common name of the kings of Egypt. Of these ten at least are mentioned in the Hebrew Scriptures.

PHARAON is the name of a game of chance, the principal rules of which are: The banker holds a pack, consisting of 52 cards; he draws all the cards one after the other, and

lays them down alternately at his right and left hand; then the ponte may at his pleasure set one or more stakes upon one or more cards, either before the banker has begun to draw the cards, or after he has drawn any number of couples. The banker wins the stake of the ponte when the card of the ponte comes out in an odd place on his right hand, but loses as much to the ponte when it comes out in an even place on his left hand. The banker wins half the ponte's stake when it happens to be twice in one couple. When the card of the ponte, being but once in the stock, happens to be the last, the ponte neither wins nor loses; and the card of the ponte being but twice in the stock, and the last couple containing his card twice, he then loses his whole stake. De Moivre has shown how to find the gain of the banker in any circumstance of cards remaining in the stock, and of the number of times that the ponte's card is contained in it. Of this problem he enumerates four cases, viz. when the ponte's card is once, twice, three, or four times in the stock. In the first case,

the gain of the banker is $\frac{1}{n} \cdot n$ being the number of cards in the stock. In the second case,

his gain is $\frac{(n-2) \times y}{n(n-1)} + \frac{2}{n \times (n-1)}$, or

$\frac{\frac{1}{2}n + 1}{n \times (n-1)}$ supposing $y = \frac{1}{2}$. In the third

case, his gain is $\frac{3y}{2 \times (n-1)}$, or $\frac{3}{n \times (n-1)}$ sup-

posing $y = \frac{1}{2}$. In the fourth case, the gain of the banker, or the loss of the ponte, is

$\frac{2n-5}{(n-1) \times (n-3)} y$, or $\frac{2n-5}{2 \times (n-1) \times (n-3)}$

supposing $y = \frac{1}{2}$. De Moivre has calculated a table, exhibiting this gain or loss for any particular circumstance of the play; and he observes, that at this play the least disadvantage of the ponte, under the same circumstances of cards remaining in the stock, is when the card of the ponte is but twice in it; the next greatest when three times, the next when once, and the greatest when four times. He has also demonstrated, that the whole gain per cent. of the banker upon all the money that is adventured at this game, is 2l. 19s. 10d. See De Moivre's Doctrine of Chances, page 77, &c. p. 105, &c.

PHARISAICAL. *a.* (from *pharisee*.) Ritual; externally religious; from the sect of the Pharisees, whose religion consisted almost wholly in ceremonies (*Bacon*).

PHARISEES, a celebrated sect among the ancient Jews; so called, say some, because separated from the rest by the austerity of their life, and by their professing a greater degree of holiness, and a more religious observation of the law.

This is the import of the word פָּרִישִׁי in the Hebrew, or rather Chaldee tongue; whence is

formed the Greek *Φαρισαῖοι*, and the Latin *Pharisæus*. St. Jerom, and several of the rabbins, maintain this etymology; which is very agreeable to the state and character of the Pharisees; who were not only distinguished from the rest by their manner of life, but by their habit. However, others, with less probability, have derived the name from *פָּרַשׁ* *exposuit*, because the Pharisees were in the highest reputation for expounding the law.

It is very difficult to fix the precise origin of the Pharisees. The Jesuit Serrarius places their first rise about the time of Esdras; because it was then that the Jews first began to have interpreters of their traditions. Maldonat, on the other hand, will not have this sect to have arisen among the Jews, till a little before the time of Christ. Others, perhaps with more probability, refer the origin of the Pharisees to the time of the Maccabees.

Josephus, who describes their dogmata, says, that they attributed all to destiny, and to God; so, however, as not to deprive man of his free agency; which Sixtus of Sienna thus explains: the Pharisees believed, that all things were done by destiny, i. e. with God's foreknowledge, and in consequence of his immutable decree; the will of man still remaining free and unaffected: *Fato, hoc est, Dei præscientia, & immobili decreto, omnia geri; manente tamen libero humanæ libertatis assensu.*

They owned the immortality of the soul, a resurrection, and a future state; but they admitted, at the same time, as some have supposed, a kind of metempsychosis, or transmigration of souls: They also held the doctrine of angels, and separate human spirits.

PHARMACA, among the ancients, meant medicated or enchanted compositions of herbs, minerals, &c. some of which, when taken inwardly, were supposed to cause blindness, madness, love, &c. others infected by touch; such was the garment sent by Medea to Creusa, prepared *secundum artem*; and others operated upon persons at a distance.

PHARMACEUTICAL. **PHARMACEUTIC**. *α. (Φαρμακευτικός, from φαρμακῆν) Relating to the knowledge or art of pharmacy, and preparation of medicines.*

PHARMACI, in antiquity, were two persons who were employed in the illustration or purification of cities.

PHARMACOLITE. *Chaux arseniatée.* Haüy. A mineral of a snow-white colour; occurring in small crystals occasionally prismatic, but more commonly circular; sometimes the crystals are aggregated into bundles, and sometimes into masses of other forms. Internally it is glistening with a silky lustre: its fracture is radiated or divergingly fibrous; it also presents large and small granular distinct concretions. The crystallized varieties are translucent. It is very tender, and easily frangible.

It is soluble in nitric acid without effervescence. By the action of the blow-pipe it disengages an arsenical odour, and leaves an insolubilizable residue.

By the experiments of M. Selb, it was first ascertained to be a compound of lime and arsenic acid with a little cobalt: a result which has been fully confirmed by a complete analysis of it by Klaproth.

One hundred grains of this mineral, according to the celebrated chemist last mentioned, lose, by being moderately heated, and without the disengagement of any arsenical or other odour, or visible vapour, 22.5 grains which are water of crystallization. The residue by digestion in nitric acid is dissolved, except six grains which are a mixture of silex and alumine. The nitrous solution affords with acetite of lead a copious precipitate of arseniat of lead which, when washed and dried, weighed 138 grains, and indicated 46.5 of arsenic acid. The remaining fluid, with the washings, was moderately evaporated and treated with a little muriatic acid, to separate the small portion of acetited lead which it contained, and was then mixed with sulphuric acid. This produced a large deposit of sulphat of lime, which after being washed with dilute spirit of wine and heated to redness, weighed 54 grains, and therefore contained 23 grains of lime. The residual liquor being neutralized by carbonated soda, and evaporated to dryness, was dissolved in water, and left behind 0.5 grains of a blue powder, which tinged borax of a deep blue colour, and was oxyd of cobalt. Hence 100 parts of pharmacolite contain

46.5 Arsenic acid,
23. Lime,
0.5 Oxyd of cobalt,
6. Silex with alumine,
22.5 Water.

98.5

of these the first three ingredients appear to be the only ones necessary to the constitution of this mineral.

It has been found near Withchen in Swabia in a vein of granite, accompanied by heavy spar and gypsum. It has also been met with at St. Marieaux mines in France.

PHARMACOLOGIST. *s. (φαρμακων λεγων.)* One who writes upon drugs (*Woodward*).

PHARMACOLGY. *s. (φαρμακων λεγων.)* The knowledge of drugs and medicines.

PHARMACOPŒIA. (*φαρμακοποια* from *φαρμακων*, a medicine, and *ποιω*, to make.) A dispensatory; or compilation of medical materials. The term has of late years, however, been confined almost entirely to a dispensatory published by authority; almost every government in Europe having been long aware of the expediency, and indeed necessity, of having some regular standard by which to regulate official compositions and preparations. The first work of this kind published by authority appears to have been the dispensatory of Valerius Cordus, introduced to the world in 1542, under the sanction of the senate of Nuremberg. It is for the most part a compilation

PHARMACOPŒIA.

from Mesue and Nicholas of Salerno; and retains some degree of celebrity even in the present day, from Hoffman's numerous references to it. The Pharmacopœia Bergamensis followed it in 1581, under the authority of the senate of Bergamo: and to this succeeded the Augustan pharmacopœia, first published at Augsburg in 1601, and afterwards at Rotterdam in 1653, with many valuable notes by Zwelfer. The former of these two editions may be esteemed the basis of the best pharmacopœias of modern times; the earliest of the London college, published in 1618, and of the Paris school, published in 1637, are distinctly founded upon it. Since this period pharmacopœias of authorised form have become so numerous, that it would be tedious and useless to run over even a muster roll. We shall only, therefore, observe upon them generally, that the three colleges of London, Edinburgh, and Dublin have now pharmacopœias of great value and genuine science: all of them published since the beginning of 1803, and the last edition of the London as recently as 1809.

Concerning this last, therefore, which ought to be regarded as the most complete of the whole, it may be expected that we should offer a few particulars. A period of twenty-two years had existed since the publication of the preceding edition; and hence it may well be expected that many preparations and terms but ill accorded with the actual state of the medical art, and more especially with the actual state of chemistry and natural history.

In the general arrangement some alteration has been made, and a greater degree of simplicity hereby obtained: but we discover no aim at any thing like scientific grouping, although without such an endeavour a common alphabetic succession might have answered as well as any other. Hence, while some of the metallic preparations are given under the heads of the substances to which they belong simply and chemically, others are given under the heads of the mere colours they produce when dissolved in spirits of wine; and the different preparations of the same substances are thus perpetually separated at a wide distance from each other. These disjunctions of different forms of the same substance are very numerous, and in various instances very incondite. The nomenclature is considerably improved upon the whole; it is in some instances, as in the case of anthesis and cusparia, pressed a little too far, and perhaps in the case of potassa and soda, which are now universally acknowledged to be oxyds of metals, not quite pressed far enough. The college, in an elegant Latin preface, complains of the horrid barbarity of the first of these words; and it might have complained equally of the second, although not quite so disgusting in pronunciation: but it should not only have complained, it should have corrected; there was no necessity for either of these terms, at least in a medical contemplation of the science. Cetaceum is elegantly adopted for sperma ceti;

octarius is perhaps preferable to congius, though the alteration was hardly called for; fluidunica and fluidrachma are rather fitted for the meridian of Germany than of England; but minimum is certainly a better term, and subject to better regulations than gutta.

The preparations and compounds are exhibited under the following heads:

Acida	Spiritus
Alkalia et eorum	Tincturæ
Sales	Ætherea
Terræ et eorum	Vina
Sales	Acetica
Sulphurea	Mellita
Metalla et eorum	Syrupi
Sales	Confectiones
Vegetabilia	Pulveres
Olea Expressa	Pilulæ
Olea Distillata	Præparata ex Ani-
Aquæ Distillatæ	malitus
Decocta	Emplastra
Infusa	Cerata
Mucilagines	Unguenta
Extracta	Linimenta
Misturæ	Cataplasma

Upon these divisions the limits to which we are confined prevent us from making more than a few observations.

Among the acids we perceive a form for the citric, now first introduced into the list, which will be found a useful and elegant medicine; we have a new form for the nitric, and the flores benzoës assume the name of acidum benzoicum.

In the alkalines we meet with no great difference, except in the change of names, which, for the most part, are shortened from those of the Edinburgh Pharmacopœia.

The same general observation may apply to the earths and salts, which, under the existing Pharmacopœia, form one common chapter with the two preceding divisions. The chapter sales employs the term soda instead of that of natron.

The sulphurea of the new Pharmacopœia is nearly a transcript of the preparata e sulphure of that hitherto in use.

Among the metallica we perceive the pulvis antimonialis ordered to be prepared with half the quantity of sulphurated antimony to that of gross antimony, as under the late form. A useful and well-known preparation of arsenic is introduced under the name of liquor arsenicalis. Copper furnishes two preparations, cuprum ammoniatum and liquor cupri ammoniati; and iron several additional forms.

Among the distilled waters, the aqua anethi is banished, and the aqua carui introduced in its stead.

The addition to the chapter of decoctions is numerous, and consists chiefly in a form of this kind for the dulcamara, lichen, senega, and veratrum.

To the infusions there is also a very numerous addition: angustura, cloves, cascarrilla, cinchona, columbo, quassia, rhubarb, simarouba, tobacco, digitalis, horse-radish, each be-

comes a separate subject of this mode of preparation.

Among the mucilages, that of tragacanth is omitted.

The extracts afford us new preparations in the hop (*humulus lupulus*), poppy, sarsaparilla, dandelion (*taraxacum*), and hemlock.

The mixtures give us a new form for gum guaiacum.

The spirits revive the old *spiritus anisi*, and *spiritus raphani*, the latter under the newer name of *spiritus armoracæ compositus*.

The chapter of tinctures provides a new form for capsicum, digitalis, humulus, hyoscyamus, kino.

The acetæ give us a form for the colchicum.

The syrups provide a form for the lemon, and order the *syrupus papaveris somniferi* to be prepared from its extract.

The term *confectiones* is intended to embrace equally electuaries, confections, and conserves: from this chapter several of the existing forms are banished.

The list of *pulveres* is also considerably diminished, chiefly by a rejection of several of the cretaceous preparations.

Among the *pilulæ* we now meet with a gambooge pill; the opium pill is banished.

The list of *emplastra* is diminished in a few forms, and enriched by about an equal number.

The *cerata* are increased by a *ceratum sabinæ* and *C. lyttæ*.

The *unguenta* are much diminished; several of those, indeed, in the existing Pharmacopœia being transferred under a different preparation to the chapter of *cerata*: while as new articles we have an *U. hydrargyri nitrici*, *U. hydrargyri nitrico-oxydati*, and *U. veratri*.

The *liniments* give us a new preparation, a *lin. æruginis*.

The *cataplasms* offer us a new form for one prepared from meal and yeast, under the title of *C. fermenti*.

PHARMACOPOLIST. *s.* (φαρμακων πολωτης.) An apothecary; one who sells medicines.

PHARMACY. The genuine science of therapeutics may be divided into three parts: medicinal materials, the preparation of those materials, and the diseases in which they are employed. Pharmacy includes the second of these divisions; and is, hence, the doctrine of preserving, arranging, compounding, and intermixing the different articles of the *materia medica*, so that as simple substances we may obtain their virtues in the most active or most convenient form, and, in a state of combination, redouble or vary their powers according to the intention we have in view. In prosecuting this subject a multiplicity of operations are necessary, some of them mechanical, some chemical, which constitute the means by which the result is to be attained; and under this natural division the means and the end, pharmaceutical operations, and pharmaceutical preparations, we shall consider the subject before us: availing ourselves to a considerable extent of an article upon the same subject furnished by the editor of this department of the *PAN-TOLOGIA* to another respectable dictionary of arts and sciences a few years ago, but availing ourselves

of the various important discoveries which have since taken place in several branches of chemistry, so far as they are connected with the present subject, and re-modelling it as far as is necessary in reference to the new Pharmacopœia of the London college, which had not then made its appearance.

PART I.—PHARMACEUTICAL OPERATIONS.

Under this head we shall comprise the mode of collecting and preserving medicinal simples: the mechanical instruments employed, and the changes they introduce: chemical instruments and apparatus, their use, application, and power.

Collection and Preservation of Simples.

Each of the kingdoms of nature furnishes articles employed in medicine in their natural state, or when prepared by pharmacy; and in collecting these our first attention should be to make choice of sound and perfect substances; to throw off whatever is injured or decayed, and to separate them from all adventitious matters. As a general rule, they must be defended from the effects of moisture, great heat, cold, and freely exposed to the air. Yet where their activity and virtue depend on volatile principles, instead of being freely exposed to the air, they must be confined, as much as possible, from its contact.

The vegetable kingdom affords us the most numerous articles; these should rather be obtained from countries in which they grow naturally than countries in which they merely grow by transplantation; and those which grow wild, in dry soils, and exposed situations fully open to the air and the sun, are for the most part to be preferred to plants that are cultivated, or that grow in moist, low, shady, and confined situations. Annual roots should be collected before they shoot forth their stalks or flowers; biennial roots in the harvest of their first year, or the spring time of their second; perennial roots either in the spring time before the sap has begun to mount, or in harvest after it has returned. Worm-eaten or decayed roots, except in a few cases of resinous plants, are to be rejected; the rest are to be cleaned immediately with a brush and cold water; immersing them in the water as short a time as possible, and cutting off the radicles and fibres when not essential. Roots which consist chiefly of fibres, and have but a small sap, may be dried at once; if juicy and not aromatic, in a heat somewhat below 100° of Fahrenheit; but if aromatic, by simply exposing them to a current of cold dry air, and frequently turning them in it. If very thick and strong, they must be split and cut into slices and strung upon threads; if covered with a tough bark, they may be peeled and dried while fresh. Such as lose their virtues by drying are to be kept buried in dry sand.

It is difficult to lay down general rules for collecting stalks and leaves, some of which acquire, while others lose, their activity by age. Aromatics should be collected after the flower-buds are formed; non-aromatics, if annuals, when in flower or about to flower, biennials before they shoot; and perennials before they flower, especially the woody-fibred. They should be gathered in dry weather, after the morning dew is off, or before it falls in the evening. Generally speaking, they should be tied in bundles, and hung up in a shady, warm, and airy place, or spread upon the floor, and frequently turned. If very juicy, they are to be laid upon a sieve, and dried by a gentle degree of artificial warmth. Sprouts are to be collected before the buds open, and stalks to be gathered in autumn. Barks are to be collected when the most

PHARMACY.

active part of the vegetables are concentrated in them. Spring is preferred for resinous barks, and autumn for the others which are rather gummy than resinous. Young trees afford the best bark for medical purposes.

The same rules direct the collection of woods; but they must not be taken from very young trees. Among the resinous woods, the heaviest, which sink in water, are selected. The albumen is to be rejected.

Flowers are collected in clear dry weather, before noon, but after the dew is off: either when they are just about to open, or immediately after they have opened. Of some the petals only are preserved, and the colourless claws are even cut away; of others whose calyx is odorous, the whole flower is kept. Flowers which are too small to be pulled singly, are dried with part of the stalk: these are called heads or tops.

Flowers are to be dried nearly as leaves, but more quickly, and with more attention. As they must not be exposed to the sun, it is best done by a slight degree of artificial warmth. When they lose their colour and smell they are unfit for use.

Seeds and fruits, unless when otherwise directed, are to be gathered when ripe, but before they fall spontaneously. Some pulpy fruits are freed from their core and seeds, strung upon thread, and dried artificially. They are in general best preserved in their natural coverings, although some, as the colocynth, are peeled, and others, as the tamarind, preserved fresh. Many of these are apt to spoil, or become rancid; and as they are then no longer fit for medical use, no very large quantity of them should be collected at a time.

The proper drying of vegetable substances is of the greatest importance. This is often directed to be done in the shade, and slowly, that the volatile and active particles may not be dissipated by too great heat; but this is an error, for they always lose infinitely more by slow than by quick drying. When, on account of the colour, they cannot be exposed to the sun, and the warmth of the atmosphere is insufficient, they should be dried by an artificial warmth, less than 100° Fahrenheit, and well exposed to a current of air. When perfectly dry and friable, they have little smell; but after being kept some time, they attract moisture from the air, and regain their proper odour.

The boxes and drawers in which vegetable matters are kept, should not impart to them any smell or taste; and more certainly to avoid this, they should be lined with paper. Such as are volatile, of a delicate texture, or subject to suffer from insects, must be kept in well covered glasses. Fruits and oily seeds, which are apt to become rancid, must be kept in a cool, and dry, but by no means in a warm or moist place.

Oily seeds, odorous plants, and those containing volatile principles, must be collected fresh every year. Others, whose properties are more permanent, and not subject to decay, will keep for several years. Vegetables collected in a moist and rainy season are in general more watery and apt to spoil. In a dry season, on the contrary, they contain more oily and resinous particles, and preserve much better.

Mechanical Operations.

These consist of the mode of determining the weight or measure of bodies; their division into minute particles; their separation of part from part, or of the useful from the useless; the modes of intermixing them.

Weights and Measures.—The quantities of sub-

stances employed as medicines are determined with the greatest accuracy by weighing. The scales should balance with the utmost precision, and turn with the utmost facility. Balances should be defended as much as possible from acid and other corrosive vapours, and not be unnecessarily suspended, as their delicacy of decision is hereby much impaired; and to guard against this last evil in another way, they should never be overloaded.

The want of an uniformity of weights and measures which is felt in every country, and in every branch of trade and commerce, is of peculiar inconvenience in pharmacy. All our college pharmacopœias command the use of troy weight; yet the wholesale druggists in every instance, excepting where a very small portion of an article is bought by grains, simples, or drams, sell by avoirdupois weight; and there is reason to fear that, both amongst apothecaries and druggists, most of the pharmaceutic compositions are prepared by this last division; in consequence of which it is impossible for the physician to know the exact strength of the dose he prescribes: and if he do, he cannot often obtain it in the proper proportions of its respective ingredients. The difficulty is still increased by a promiscuous use of weights and measures in determining the quantities of fluids; on which account, though the London college still authorises both for distinct purposes, the colleges of Edinburgh and Dublin have rejected measures altogether.

For measuring fluids, the graduated glass measures are always to be preferred: they should be of different sizes, according to the quantities they are intended to measure. Elastic fluids are also measured in glass tubes, graduated by inches and their decimals.

Specific gravity is the weight of a determinate bulk of any body. For a standard of comparison, distilled water has been assumed as unity. The specific gravity of solids is ascertained, by comparing the weight of the body in the air with its weight when suspended in water. The quotient obtained by dividing its weight in air, by the difference between its weight in air and its weight in water, is its specific gravity. The specific gravity of fluids may be ascertained by comparing the loss of weight of a solid body, such as a piece of crystal, when immersed in distilled water, with its loss when immersed in the fluid we wish to examine; by dividing its loss of weight in the fluid by its loss of weight in the water, the quotient is the specific gravity of the fluid: or a small phial, containing a known weight of distilled water, may be filled with the fluid to be examined and weighed, and by dividing the weight of the fluid by the weight of the water, the specific gravity is ascertained.

Although these are the only general principles by which specific gravities are ascertained, yet as the result is always influenced by the state of the thermometer and barometer at the time of the experiments, and as the manipulation is a work of great nicety, various ingenious instruments have been contrived to render the process and calculation easy. Of all these, the gravimeter of Morveau seems to deserve the preference.

It would be of material consequence to science and the arts, if specific gravities were always indicated by the numerical term expressing their relation to the specific gravity of distilled water. This however is unfortunately not the case. The excise-officers in this country collect the duties paid by spirituous liquors, by estimating the proportion which they contain of a standard spirit, about 0.935

PHARMACY.

in specific gravity, which they call hydrometer proof, and they express the relation which spirits of a different strength have to the standard spirit by saying that they are above or under hydrometer proof. Thus one to six, or one in seven below hydrometer proof means that it is equal in strength to a mixture of six parts of proof spirit with one of water.

The only other mode of expressing specific gravities, which it is necessary to notice, is that of Baumé's aerometer, as it is often used in the writings of the French chemists, and is little understood in this country. For substances heavier than water he assumes the specific gravity of distilled water as zero, and graduates the stem of his instrument downwards, each degree being supposed by him to express the number of parts of muriat of soda contained in a given solution, which however is not at all the case. For substances lighter than water the tube is graduated upwards, and this zero is afforded by a solution of 10 of salt in 90 water.

Mechanical division.—By this process substances are reduced to a form better adapted for medical purposes; and by the increase of their surface, their action is promoted, both as medical and chemical agents. It is performed by cutting, bruising, grinding, grating, rasping, filing, pulverization, trituration, and granulation, by means of machinery or of proper instruments.

Pulverization is the first of these operations that is commonly employed in the apothecary's shop. It is performed by means of pestles and mortars. The bottom of the mortars should be concave; and their sides should neither be so inclined as not to allow the substances operated on to fall to the bottom between each stroke of the pestle, nor so perpendicular as to collect it too much together, and to retard the operation. The materials of which the pestles and mortars are formed should resist both the mechanical and chemical action of the substances for which they are used. Wood, iron, marble, siliceous stones, porcelain, and glass, are all employed; but copper, and metals containing copper, are to be avoided. They should be provided with covers, to prevent the finest and lightest parts from escaping, and to defend the operator from the effects of disagreeable or noxious substances. But these ends are more completely attained, by tying a piece of pliable leather round the pestle and round the mouth of the mortar. It must be closely applied, and at the same time so large, as to permit the free motion of the pestle. In some instances, it will be even necessary for the operator to cover his mouth and nostrils with a wet cloth, and to stand with his back to a current of air, that the very acrid particles which arise may be carried from him. The addition of a little water or spirit of wine, or of a few almonds, to very light and dry substances, will prevent their flying off. But almonds are apt to induce rancidity, and powders are always injured by the drying which is necessary when they have been moistened. Water must never be added to substances which absorb it, or are rendered cohesive by it.

All vegetable substances must be previously dried. Resins and gummy resins, which become soft in summer, must be powdered in very cold weather, and must be beaten gently, or they will be converted into a paste instead of being powdered. Wood, roots, barks, horn, bone, ivory, &c. must be previously cut, split, chipped, or rasped. Fibrous woods and roots should be finely shaved after their bark is removed, for otherwise their powders will be full of hair-like filaments, which

can scarcely be separated. Some substances will even require to be moistened with mucilage of tragacanth, or of starch, and then dried before they can be powdered. Camphor may be conveniently powdered by the addition of a little spirit of wine, or almond oil. The emulsive seeds cannot be reduced to powder, unless some dry powder be added to them. To aromatic oily substances, sugar is the best addition. All impurities and inert parts having been previously separated, the operation must be continued and repeated upon vegetable substances, till no residuum is left. The powders obtained at different times must then be intimately mixed together, so as to bring the whole to a state of perfect uniformity.

Very hard stony substances must be repeatedly heated to a red heat, and then suddenly quenched in cold water, until they become sufficiently friable. Some metals may be powdered hot in a heated iron mortar, or may be rendered brittle by alloying them with a little mercury.

Trituration is intended for the still more minute division of bodies. It is performed in flat mortars of glass, agate, or other hard materials, by giving a rotatory motion to the pestle; or on a levigating stone, which is generally of porphyry, by means of a muller of the same substance. On large quantities it is performed by rollers of hard stone, turning horizontally upon each other, or by one vertical roller twining on a flat stone.

The substances subjected to this operation are generally previously powdered or ground.

Levigation differs from trituration only in the addition of water or spirit of wine to the powder operated upon, so as to form the whole mass into a kind of paste, which is rubbed until it be of sufficient smoothness or fineness. Earths, and some metallic substances, are levigated.

Granulation is employed for the mechanical division of some metals. It is performed either by stirring the melted metal with an iron rod until it cools, or by pouring it into water, and stirring it continually as before, or by pouring it into a covered box, previously well rubbed with chalk, and shaking it until the metal cools, when the rolling motion will be converted into a rattling one. The adhering chalk is then to be washed away.

Mechanical separation is obtained by sifting, elutriation, decantation, filtration, despumation, expression.

Sifting. From dry substances, which are reduced to the due degree of minuteness, the coarser particles are to be separated by sieves of iron-ware, hair-cloth or gauze, or by being dusted through bags of fine linen. For very light and valuable powders, or acrid substances, compound sieves, having a close lid and receiver, must be used. The particles which are not of sufficient fineness to pass through the interstices of the sieve may be again powdered.

Elutriation is confined to mineral substances, on which water has no action. It is performed for separating them from foreign particles and impurities, of a different specific gravity, in which case they are said to be washed; or for separating the impalpable powders, obtained by trituration and levigation from the coarser particles. This process depends upon the property that very fine or light powders have of remaining for some time suspended in water; and is performed by diffusing the powder or paste formed by levigation through plenty of water, letting it stand a sufficient time, until the coarser particles settle at the bottom; and then pouring off the liquid in which the finer or lighter particles are suspended. Fresh water may

PHARMACY.

be poured on the residuum, and the operation repeated; or the coarser particles, which fall to the bottom, may be previously levigated a second time.

Decantation. The fine powder which is washed over with the water is separated from it, by allowing it to subside completely, and by either decanting off the water very carefully, or by drawing it off by a syringe or syphon. These processes are very frequently made use of for separating fluids from solids which are specifically heavier, especially when the quantity is very large, or the solid so subtle as to pass through the pores of most substances employed for filtration, or the liquid so acrid as to corrode them.

Filtration. For the same purpose of separating fluids from solids, straining and filtration are often used. These differ only in degree, and are employed when the powder either does not subside at all, or too slowly and imperfectly for decantation. The instruments for this purpose are of various materials, and must in no instance be acted upon by the substances for which they are employed. Fats, resins, wax, and oils, are strained through hemp or flax spread evenly over a piece of wire-cloth or net stretched in a frame. For saccharine and mucilaginous liquors, fine flannel may be used; for some saline solutions, linen. Where these are not fine enough, unsized paper is employed, but it is extremely apt to burst by hot watery liquors which dissolve its size; and very acrid liquors, such as acids, are filtered by means of a glass-funnel, filled with powdered quartz, a few of the larger pieces being put in the neck, smaller pieces over these, and the finer powder placed over all. The porosity of this last filter retains much of the liquor; but it may be recovered by gently pouring on it as much distilled water; the liquor will then pass through, and the water be retained in its place. Water may be filtered in large quantities through basins of porous stone, or artificial basins of nearly equal parts of fine clay and coarse sand. The size of the filters depends on the quantity of matter to be strained. When large, the flannel or linen is formed into a conical bag, and suspended from a hoop or frame; the paper is either spread on the inside of these bags, or folded into a conical form, and suspended by a funnel. It is of advantage to introduce glass rods or quill-barrels between the paper and funnel, to prevent them from adhering too closely. What passes first is seldom fine enough, and must be poured back again, until by the swelling of the fibres of the filter, or filling up of its pores, the fluid acquires the requisite degree of limpidity. The filter is sometimes covered with charcoal powder, which is a useful addition to muddy and deep-coloured liquors. The filtration of some viscid substances is much assisted by heat.

Expression is a species of filtration, assisted by mechanical force. It is principally employed to obtain the juices of fresh vegetables, and the unctuous vegetable oils. It is performed by means of a screw press with plates of wood, iron, or tin. The subject of the operation is previously beaten, ground, or bruised. It is then inclosed in a bag, which must not be too much filled, and introduced between the plates of the press. The bags should be of hair-cloth, or canvass inclosed in hair-cloth. Hempen and woollen bags are apt to give vegetable juices a disagreeable taste. The pressure should be gentle at first, and increased gradually. Vegetables intended for this operation should be perfectly fresh and freed from all impurities. In general they should be expressed as soon as they are bruised,

for it disposes them to ferment; but subacid fruits give a larger quantity of juice and of finer quality, when they are allowed to stand some days in a wooden or earthen vessel after they are bruised. To some vegetables which are not juicy enough of themselves, the addition of a little water is necessary. Lemons and oranges must be peeled, as their skins contain a great deal of essential oil, which would mix with the juice. The oil itself may be obtained separately, by expression with the fingers against a plate of glass.

For unctuous seeds iron-plates are used; and it is customary not only to heat the plates, but to warm the bruised seeds in a kettle over the fire, after they have been sprinkled with some water, as by these means the product is increased, and the oil obtained is more limpid. But as their disposition to rancidity is increased by it, if possible this practice should be laid aside, or confined to exposing the bruised seeds, inclosed in a bag, to the steam of hot water.

Despumation is generally practised on thick and clammy liquors, which contain much slimy and other impurities, not easily separable by filtration.

The scum arises either by simply heating the liquor, or by clarifying it, which is done by mixing with the liquor, when cold, whites of eggs well beaten with a little water, which on being heated coagulates, and entangling the impurities of the liquor, rises with them to the surface, and may be easily removed by a perforated ladle. Or the liquor may now be filtered with ease. Spirituous liquors are clarified by means of isinglass dissolved in water, or any albuminous fluid, such as milk, which coagulates by the action of alcohol without the assistance of heat. Some expressed juices, such as those of the antiscorbutic plants, are instantly clarified by the addition of vegetable acid, such as the juice of bitter oranges.

Fluids can only be separated from each other, when they have no tendency to combine, and when they differ in specific gravity. The separation may be effected by skimming off the lighter fluid with a silver or glass spoon; or by drawing it off by a syringe or syphon; or by means of a glass separatory, which is an instrument having a projecting tube, terminating in a very slender point, through which the heavier fluid alone is permitted to run; or by means of the capillary attraction of a spongy woollen thread; for no fluid will enter a substance whose pores are filled by another, for which it has no attraction; and, lastly, upon the same principle, by means of a filter of unsized paper, previously soaked in one of the fluids, which in this way readily passes through it, while the other remains behind.

Mechanical mixture is performed by agitation, trituration, or kneading; but these will be best considered in treating of the forms in which medicines are exhibited.

Chemical Operations and Results.

Under this chapter we have to consider the apparatus employed, the changes produced, and the general analyses that ensue.

The apparatus consists of vessels, fuel, or heat; and the different modes by which such fuel or heat is applied, whether lamps, furnaces, &c.

The vessels must necessarily vary in their form and materials; upon the first of which it will be more convenient to enlarge as we proceed to treat of the particular operations in which they are employed. In choosing the materials for the construction of our vessels, the properties most generally

PHARMACY.

required are a power of resisting chemical agents' transparency, compactness, strength, fixity and infusibility, and an ability to sustain sudden variations of temperature without breaking.

Generally speaking, metals possess the four last properties in considerable perfection; but they are all opaque. Iron and copper are apt to be corroded by chemical agents; and a solution of the last is often followed by dangerous affections. Tinning them will sometimes, but not always, answer; for tin and lead are often too fusible. Platinum, gold, and silver, resist most of the chemical agents, but are too expensive for general use.

Good earthen ware resists the greatest intensity of heat, but has no other property to recommend it. Clay, the basis of all such wares, is plastic when worked with water, and sufficiently hard when burnt with an intense heat. But intense heat contracts it unduly; and it is apt to split and crack upon exposure to sudden changes of temperature; whence it is necessary to counteract this property by the addition of some other substance. Siliceous sand, clay reduced to powder, and then burnt with a very intense heat, and plumbago, are occasionally used. These additions, however, are attended with other inconveniences; plumbago especially is liable to combustion, and sand diminishes the compactness; so that when not glazed, they are porous, and when glazed, they are acted upon by chemical agents. The chemical vessels, manufactured by Messrs. Wedgwood, are the best of this description, except porcelain, which is too expensive.

Glass possesses the three first qualities in an eminent degree, and may be heated red-hot without melting. Its greatest inconvenience is its disposition to crack or break in pieces when suddenly heated or cooled. As this is occasioned by its unequal expansion or contraction, it is best remedied by forming the vessels very thin, and giving them in general a rounded shape. Glass-vessels should also be well annealed, that is, cooled very slowly, after being blown, by placing them immediately in an oven while they are yet in a soft state. When ill annealed, or cooled suddenly, glass is apt to fly in pieces on the slightest change of temperature, or touch of a sharp point. We may sometimes take advantage of this imperfection; for by means of a red-hot wire, glass-vessels may be cut into any shape. Where there is not a crack already in the glass, the point of the wire is applied near the edge, by which a crack is formed; and this is afterwards easily led in any direction we wish.

Reaumur's porcelain is also glass, which by being surrounded with hot sand, is made to cool so slowly, that it assumes a crystalline texture, that destroys its transparency, but imparts to it every other quality desirable in chemical vessels. The coarser kinds of glass are commonly used in making it; but as there is no manufacture of this valuable substance, its employment is still very limited.

Lutes also form a necessary part of chemical apparatus. They are compositions of various substances, intended to close the joining of vessels, to coat glass vessels, and to line furnaces. Lutes of the first description are commonly employed to confine elastic vapours. They should therefore possess the following properties, viscosity, plasticity, compactness, the power of resisting acrid vapours, and certain degrees of heat. The viscosity of lutes depends on the presence either of unctuous or resinous substances, mucilaginous substances, or clay.

Lutes of the first kind possess viscosity and resist acrid vapours in an eminent degree; but they

are in general so fusible that they cannot be employed when they are exposed even to very low degrees of heat, and they will not adhere to any substance that is at all moist. The following are a few of this kind that have been most frequently employed.

Eight parts of yellow wax melted with one of oil of turpentine, with or without the addition of resinous substances, according to the degree of pliability and consistence required. Lavoisier's lute.

Four parts of wax melted with two of varnish and one of olive oil. Saussure's lute.

Three parts of powdered clay worked up into a paste, with one of drying oil, or, what is better, amber varnish. The drying oil is prepared by boiling 22.5 parts of litharge in 16 of linseed oil until it be dissolved. Fat lute.

Chalk and oil, or glazier's-putty, is well fitted for luting tubes permanently into glass vessels, for it becomes so hard that it cannot be easily removed.

Equal parts of litharge, quicklime, and powdered clay, worked into a paste with oil varnish, is sometimes used to daub the cracks in glass vessels, so as to render them again fit for some purposes.

Melted pitch and brick dust.

Mucilaginous substances, such as flour, starch, gum, and glue mixed with water, with or without some powder, are sufficiently adhesive, are dried by moderate degrees of heat, and are easily removed after the operation, by moistening them with water. But a high temperature destroys them, and they do not resist corrosive vapours. Of these take the following forms.

Slips of bladder macerated in water, and applied with the inside next the vessels. They are apt, however, from their great contraction on drying, to break weak vessels.

One part of gum arabic with six or eight of chalk, formed into a paste with water.

Flour worked into a paste with powdered clay or chalk.

Almond or linseed meal formed into a paste with mucilage or water.

Quicklime in fine powder, hastily mixed with white of egg, and instantly applied, sets very quickly, but becomes so hard that it can scarcely be removed.

Slaked lime in fine powder, with glue, does not set so quickly as the former.

The cracks of glass vessels are sometimes mended by daubing them and a suitable piece of linen over with white of egg, strewing both over with finely powdered quicklime, and instantly applying the linen closely and evenly.

Earthy lutes resist very high temperatures, but they become so hard that they can scarcely be removed, and often harden so quickly after they are mixed up, that they must be applied immediately. Examples.

Quicklime well incorporated with a sixth part of muriate of soda.

Burnt gypsum, made up with water.

One ounce of borax dissolved in a pound of boiling water, mixed with a sufficient quantity of powdered clay. Mr. Watt's fire lute.

One part of clay with four of sand formed into a paste with water. This is also used for coating glass vessels, in order to render them stronger and capable of resisting violent degrees of heat. It is then made into a very thin mass, and applied in successive layers, taking care that each coat be perfectly dry before another be laid on.

PHARMACY.

The lutes for lining furnaces will be described when treating of furnaces.

The junctures of vessels which are to be luted to each other must previously be accurately and firmly fitted, by introducing between them, when necessary, shorts bits of wood or cork, or, if the disproportion be very great, by means of a cork fitted to the one vessel, having a circular hole bored through it, through which the neck of the other vessel or tube passes. After being thus fitted, the lute is either applied very thin, by spreading it on slips of linen or paper, and securing it with thread, or if it is a paste lute, it is formed into small cylinders, which are successively applied to the junctures, taking care that each piece be made to adhere firmly and perfectly close in every part before another is put on. Lastly, the whole is secured by slips of linen or bladder. In many cases, to permit the escape of elastic vapours, a small hole is made through the lute with a pin, or the lute is perforated by a small quill fitted with a stopper.

Heat and Fuel.—As caloric is an agent of the most extensive utility in the chemical operations of pharmacy, it is necessary that we should be acquainted with the means of employing it in the most economical and efficient manner.

The rays of the sun are used in the drying of many vegetable substances, and the only attentions necessary are to expose as large a surface as possible, and to turn them frequently, that every part may be dried alike. They are also sometimes used for promoting spontaneous evaporation.

The combustion of different substances is a much more powerful and certain source of heat. The substances employed for this purpose are either fluid or solid. Alcohol, oil, tallow, wood, turf, coal, charcoal, and coke, are all occasionally employed.

Alcohol, oil, and melted tallow, fluid inflammables, must be burnt on porous wicks. These act merely mechanically, by drawing up a portion of the fluid to be volatilized and inflamed. They are therefore burnt in lamps of various constructions. But although commonly used to produce light, they afford a very uniform, though not very high, temperature. It may however be increased by increasing the number of the wicks and their size. Alcohol produces a steady heat, no soot, and, if strong, leaves no residuum. Oil gives a higher temperature, but on a common wick produces much smoke and soot. These are diminished, and the light and heat increased, by making the surface of the flame bear a large proportion to the centre, which is best done by a cylindrical wick, so contrived that the air has free access both to the outside and to the inside of the cylinder, as in Argand's lamp, invented by Mr. Boulton of Birmingham. In this way oil may be made to produce a considerable temperature of great uniformity, and without the inconvenience of smoke.

Wicks have the inconvenience of being charred by the high temperature to which they are subjected, and of becoming so clogged as to prevent the fluid from rising in them. They must then be trimmed, but this is seldomer necessary with alcohol and fine oils than with the coarser oils. Lamps are also improved by adding a chimney to them. It must admit the free access of air to the flame, and then it increases the current, confines the heat, and steadies the flame. The intensity of the temperature of flame may be increased astonishingly by forcing a small current of hot air through it as by the blow pipe.

Wood, turf, coal, charcoal, and coke, solid combustibles, are burnt in grates and furnaces. Wood has the advantage of kindling readily, but affords a very unsteady temperature, is inconvenient from its flame, smoke, and soot, and requires much attention. The heavy and dense woods give the greatest heat, burn longest, and leave a dense charcoal.

Dry turf gives a steady heat, and does not require so much attention as wood; but it consumes fast, its smoke is copious and penetrating, and the empyreumatic smell which it imparts to every thing it comes in contact with adheres with great obstinacy. The heavy turf of marshes is preferable to the light superficial turf.

Coal is the fuel most commonly used in this country. Its heat is considerable and sufficiently permanent, but it produces much flame and smoke.

Charcoal, especially of the dense woods, is a very convenient and excellent fuel. It burns without flame or smoke, and gives a strong, uniform, and permanent heat, which may be easily regulated, especially when it is not in too large pieces, and is a little damp. But it is costly, and burns quickly.

Coke, or charred coal, possesses similar properties to charcoal; it is less easily kindled, but is capable of producing a higher temperature, and burns more slowly.

When an open grate is used for chemical purposes, it should be provided with cranes to support the vessels operated in, that they may not be overturned by the burning away of the fuel.

Furnaces.—In all these, the principal objects are, to produce a sufficient degree of heat, with little consumption of fuel, and to be able to regulate the degree of heat.

An unnecessary expenditure of fuel is prevented by forming the sides of the furnace of very imperfect conductors of caloric, and by constructing it so that the subject operated on may be exposed to the full action of the fire.

The degree of heat is regulated by the quantity of air which comes in contact with the burning fuel. The quantity of air is in the compound ratio of the size of the aperture through which it enters and its velocity. The velocity is increased by mechanical means, as by bellows, or by increasing the height and width of the chimney.

The size and form of furnaces, and the materials of which they are constructed, are various, according to the purposes for which they are intended.

The essential parts of a furnace are, a body for the fuel to burn in; a grate for it to burn upon; an ash-pit to admit air and receive the ashes; a chimney for carrying off the smoke and vapours.

The ash-pit should be perfectly close, and furnished with a door and register-plate, to regulate the quantity of air admitted.

The bars of the grate should be triangular, and placed with an angle pointed downwards, and not above half an inch distant. The grate should be fixed on the outside of the body.

The body may be cylindrical or elliptical, and it must have apertures for introducing the fuel and the subjects of the operation, and for conveying away the smoke and vapours.

When the combustion is supported by the current of air naturally excited by the burning of the fuel, it is called a wind-furnace; when it is accelerated by increasing the velocity of the current by bellows, it forms a blast-furnace; and when the

PHARMACY.

body of the furnace is covered with a dome, which terminates in the chimney, it constitutes a reverberatory furnace.

Furnaces are either fixed, and built of fire-brick, or portable, and fabricated of plate iron. When of iron, they must be lined with some badly conducting and refractory substance, both to prevent the dissipation of heat, and to defend the iron against the action of the fire. A mixture of scales of iron and powdered tiles worked up with blood, hair, and clay, is much recommended; and professor Hagen says, that it is less apt to split and crack when exposed at once to a violent heat, than when dried gradually, according to the common directions. Dr. Black employed two different coatings. Next to the iron he applied a composition of three parts by weight of charcoal, and one of fine clay. These are first mixed in the state of fine powder, and then worked up with as much water as will permit the mass to be formed into balls, which are applied to the sides of the furnace, and beat very firm and compact with the face of a broad hammer, to the thickness of about one inch and a half in general, but so as to give an elliptical form to the cavity. Over this, another lute, composed of six or seven parts of sand, and one of clay, is to be applied in the same manner, to the thickness of about half an inch. These lutes must be allowed to become perfectly dry before the furnace is heated, which should at first be done gradually. They may also be lined with fire bricks of a proper form, accurately fitted and well cemented together before the top plate is screwed on.

The general fault of furnaces is that they admit too much air, which prevents us from regulating the temperature. It either becomes too violent and unmanageable, or when more cold air is admitted than what is necessary for supporting the combustion, it carries off heat, and prevents us from raising the temperature as high as we otherwise would. The superior merit of Dr. Black's furnace consists in the facility with which the admission of air is regulated; and every attempt hitherto made to improve it by increasing the number of its apertures have in reality injured it.

Heat may be applied to vessels employed in chemical operations, directly, as in the open fire and reverberatory furnace. Or through the medium of sand; the sand-bath. Of water; the water-bath. Of steam; the vapour-bath. Of air, as in the muffle.

Changes produced by Chemical Processes.—These consist chiefly in a new mode of aggregation, combination, and decomposition.

The form of aggregation may be altered by fusion, vaporization, condensation, congelation, and coagulation.

Fusion is the conversion of a solid into a liquid by the sole agency of caloric. Substances differ very much in the degrees of their fusibility; some, as water and mercury, existing as fluids in the ordinary temperatures of the atmosphere; while others, as the pure earths, cannot be melted by any heat we can produce.

Liquefaction is commonly employed to express the melting of substances, as tallow, wax, resin, &c. which pass through intermediate states of softness before they become fluid. Fusion is the melting of substances which pass immediately from the solid to the fluid state, as the salts and metals, except iron and platinum.

When, in consequence of fusion, the substances operated on acquire a greater or less degree of transparency, a dense uniform texture, and great

brittleness, and exhibit a conchoidal fracture, with a specular surface, and the edges of the fragments very sharp, it is termed vitrification.

In general, simple substances are less fusible than compounds; for example, the simple earths cannot be melted singly, but when mixed are easily fused. The additions which are some times made to refractory substances to promote their fusion are termed fluxes: which fluxes are generally saline bodies.

Thus the alkalis potass and soda promote powerfully the fusion of siliceous stones; but they are only used for accurate experiments. The white-flux is a mixture of a little potass with carbonate of potass, and is prepared by deflagrating together equal parts of nitrate of potass and super-tartrate of potass. When an oxyd is at the same time to be reduced, the black flux is preferred, which is produced by the deflagration of two parts of super-tartrate of potass, and one of nitrate of potass. It differs from the former only in containing a little charcoal. Soap promotes fusion by being converted by the fire into carbonate of soda and charcoal.

Aluminous stones have their fusion greatly promoted by the addition of sub-borate of soda.

Muriat of soda, the mixed phosphate of soda and ammonia, and other salts, are also occasionally employed for the same purpose.

An open fire is sufficient to melt some substances, others require the heat of a furnace.

The vessels in which fusion is performed must resist the heat necessary for the operation. In some instances, an iron or copper ladle or pot may be used, but most commonly crucibles are employed. These are of various sizes. The large crucibles are generally conical, with a small spout for the convenience of pouring out; the small ones are truncated triangular pyramids, and are commonly sold in nests.

The Hessian crucibles are composed of clay and sand, and when good will support an intense heat for many hours, without softening or melting; but they are disposed to crack when suddenly heated or cooled. This inconvenience may be on many occasions avoided, by using a double crucible, and filling up the interstice with sand, or by covering the crucible with a lute of clay and sand, by which means the heat is transmitted more gradually and equally. Those which ring clearly when struck, and are of an uniform thickness, and have a reddish brown colour, without black spots, are reckoned the best.

Wedgewood's crucibles are made of clay mixed with baked clay finely pounded, and are in every respect superior to the Hessian, but they are very expensive.

The black-lead crucibles, formed of clay and plumbago, are very durable, resist sudden changes of temperature, and may be repeatedly used, but they are destroyed when saline substances are melted in them, and suffer combustion when exposed red-hot to a current of air.

When placed in a furnace, crucibles should never be set upon the bars of the grate, but always upon a support. Dr. Kennedy found the hottest part of a furnace to be about an inch above the grate. They may be covered, to prevent the fuel or ashes from falling into them, with a lid of the same materials, or with another crucible inverted over them.

When the fusion is completed, the substance may be either permitted to cool in the crucible, or may be poured into a heated mould anointed with

PHARMACY.

tallow, never with oil, or what is still better, covered with a thin coating of chalk, which is applied by laying it over with a mixture of chalk diffused in water, and then evaporating the water completely by heat. To prevent the crucible from being broken by cooling too rapidly, it is to be either replaced in the furnace, to cool gradually with it, or covered with some vessel to prevent its being exposed immediately to the air.

Fusion is performed with the intention of weakening the attraction of aggregation; or of separating substances of different degrees of fusibility from each other.

Vaporization is the conversion of a solid or fluid into vapour by the agency of caloric. Although vaporability be merely a relative term, substances are said to be permanently elastic, volatile, or fixed. The permanently elastic fluids or gasses are those which cannot be condensed into a fluid or solid form by any abstraction of caloric we are capable of producing. Fixed substances, on the contrary, are those which cannot be converted into vapour by great increase of temperature. The pressure of the atmosphere has very considerable effect in varying the degree at which substances are converted into vapour. Some solids, unless subjected to very great pressure, are at once converted into vapour, although most of them pass through the intermediate state of fluidity.

Vaporization is employed to separate substances differing in volatility: and to promote chemical action, by disaggregating them.

When employed with either of these views, no regard is paid to the substances volatilized, whether from solids, as in ustulation and charring; or from fluids, as in evaporation. Or whether the substances vaporized are condensed in proper vessels; for example, in a liquid form, as in distillation; or in a solid form, as in sublimation. Or whether the substances vaporized are permanently elastic, and are collected in their gaseous form, in a pneumatic apparatus.

Ustulation is almost entirely a metallurgical operation, and is employed to expel the sulphur and arsenic contained in some metallic ores. It is performed on small quantities in tests placed within a muffle. Tests are shallow vessels made of bone ashes or baked clay. Muffles are vessels of baked clay, of a semi-cylindrical form, the flat side forming the floor, and the arched portion the roof and sides. The end and sides are perforated with holes for the free transmission of air, and the open extremity is placed at the door of the furnace, for the inspection and manipulation of the process. The reverberatory furnace is commonly employed for roasting, and the heat is at first very gentle, and slowly raised to redness. It is accelerated by exposing as large a surface of the substance to be roasted as possible, and by stirring it frequently, so as to prevent any agglutination, and to bring every part in succession to the surface.

Charring may be performed on any of the compound oxyds, by subjecting them to a degree of heat sufficient to expel all their hydrogen, nitrogen, and superabundant oxygen, while the carbon, being a fixed principle, remains behind in the state of charcoal. The temperature necessary for the operation may be produced either by the combustion of other substances, or by the partial combustion of the substance to be charred. In the former case, the operation may be performed in any vessel which excludes the access of air, while it permits the escape of the vapours formed. In the latter, the access of air must be regulated in such a man-

ner, that it may be suppressed whenever the combustion has reached the requisite degree: for if continued to be admitted, the charcoal itself would be dissipated in the form of carbonic acid gas, and nothing would remain but the alkaline and earthy matter, which these substances always contain. When combustion is carried this length, the process is termed incineration. The vapours which arise in the operation of charring are sometimes condensed, as in the manufacture of tar.

Evaporation is the conversion of a fluid into vapour, by its combination with caloric. In this process, the atmosphere is not a necessary agent, but rather a hindrance, by its pressure. This forms a criterion between chemical evaporation and spontaneous evaporation, which is merely the solution of a fluid in air.

It is performed in open, shallow, or hemispherical vessels of silver, tinned copper or iron, earthen-ware or glass. The necessary caloric may be furnished by means of an open fire, a lamp, or a furnace, either immediately, or with the intervention of sand, water, or vapour. The degree of heat must be regulated by the nature of the substance operated on. In general, it should not be greater than what is absolutely necessary.

Evaporation may be partial: producing from saline fluids, concentration; and from viscid fluids, inspissation: or it may be total, and produce exsiccation.

Concentration is employed to lessen the quantity of diluting fluids, which is called dephlegmation: or as a preliminary step to crystallization.

Insipissation is almost confined to animal and vegetable substances; and as these are apt to be partially decomposed by heat, or to become empyreumatic, it should always be performed, especially towards the end of the process, in a water or vapour bath.

Exsiccation is here taken in a very limited sense; for the term is also with propriety used to express the drying of vegetables by a gentle heat, the efflorescence of salts, and the abstraction of moisture from mixtures of insoluble powders with water, by means of chalk-stones or powdered chalk pressed into a smooth mass. At present, we limit its meaning to the total expulsion of moisture from any body by means of caloric.

The exsiccation of compound oxyds should always be performed in the water bath.

Salts are deprived of their water of crystallization by exposing them to the action of heat in a glass vessel or iron ladle. Sometimes they first dissolve in their water of crystallization, or undergo what is called the watery fusion, and are afterwards converted into a dry mass by its total expulsion; as in the calcination of borax or burning of alum.

When exsiccation is attended with a crackling noise, and splitting of the salt, as in muriate of soda, it is termed decrepitation, and is performed by throwing into a heated iron vessel small quantities of the salt at a time, covering it up, and waiting until the decrepitation be over, before a fresh quantity is thrown in.

Exsiccation is performed on saline bodies, to render them more acrid or pulverulent, or to prepare them for chemical operations. Animal and vegetable substances are exsiccated to give them a solid form, and to prevent their fermentation.

Condensation is the reverse of expansion, and is produced either by mechanical pressure forcing out the caloric in a sensible form, as water is squeezed out of a sponge, or by the chemical ab-

traction of caloric, which is followed by an approximation of the particles of the substance.

This latter kind alone is the object of our investigation at present. In this way we may be supposed to condense substances existing naturally as gases or vapours; or substances naturally solid or fluid, converted into vapours by adventitious circumstances.

The former instance is almost supposititious: for we are not able, by any diminution of temperature, to reduce the permanently elastic fluids to a fluid or solid state.

The latter instance is always preceded by vaporization, and comprehends those operations in which the substances vaporized are condensed in proper vessels.

When the product is a fluid, it is termed distillation; when solid, sublimation. Distillation is said to be performed, *viâ humidâ*, when fluids are the objects of the operation. *Viâ siccâ*, when solids are subjected to the operation, and the fluid product arises from decomposition, and a new arrangement of the constituent principles.

The objects of distillation are to separate more volatile fluids from less volatile fluids or solids: to promote the union of different substances: and to generate new products by the action of fire.

In all distillations, the heat applied should not be greater than what is necessary for the formation of the vapour, and even to this degree it should be gradually raised. The vessels also in which the distillation is performed should never be filled above one-half, and sometimes not above one-fourth, lest the substance contained in them should boil over.

As distillation is a combination of evaporation and condensation, the apparatus consists of two principal parts: the vessels in which the vapours are formed: and those in which they are condensed.

The vessels employed for both purposes are very various in their shapes, according to the manner in which the operation is conducted. The first difference depends on the direction of the vapour after its formation. It either descends, ascends, or passes off by the side; constituting a distillation *per descensum*, *per ascensum*, or *per latus*.

In the distillation *per descensum*, a perforated plate of tinned iron, or other materials, is fixed within any convenient vessel, so as to leave a space beneath it. On this the subject of the operation is laid, and over it is placed another plate, accurately closing the mouth of the vessel, and sufficiently strong to support the fuel. Thus the heat is applied from above, and the vapour is forced to descend into the inferior cavity, where it is condensed. In this way the oil of cloves is prepared, and on the same principles tar is manufactured, and mercury and zinc are separated from their ores.

In the distillation *per ascensum*, the vapour is allowed to arise to some height, and then is conveyed away to be condensed. The vessel most commonly employed for this purpose is the common copper still, which consists of a body for containing the materials, and a head into which the vapour ascends. From the middle of the head a tube rises for a short way, and is then reflected downwards, through which the steam passes to be condensed. Another kind of head, rising to a great height before it is reflected, is sometimes used for separating fluids, which differ little in volatility, as it was supposed that the less volatile vapours would be condensed and fall back into the still, while only the more volatile vapours would arise

to the top, so as to pass to the refrigeratory. The same object may be more conveniently attained by managing the fire with caution and address. The greater the surface exposed, and the less the height the vapours have to ascend, the more rapidly does the distillation proceed; and so well are these principles understood by the Scotch distillers, that they do not take more than three minutes to discharge a still containing gallons of fluid.

The condensing apparatus used with the common still is very simple. The tube in which the head terminates is inserted into the upper end of a pipe, which is kept cool by passing through a vessel filled with water, called the refrigeratory. This pipe is commonly made of a serpentine form; but as this renders it difficult to be cleaned, Dr. Black recommends a sigmoid pipe. The refrigeratory may be furnished with a stop-cock, that when the water it contains becomes too hot, and does not condense all the vapour produced, it may be changed for cold water. From the lower end of the pipe, the product of the distillation drops into the vessel destined to receive it; and we may observe, that when any vapour issues along with it, we should either diminish the power of the fire, or change the water in the refrigeratory. There was a process of this kind, called circulation. It consisted in arranging the apparatus, so that the vapours were no sooner condensed into a fluid form, than this fluid returned back into the distilling vessels, to be again vaporized; and was effected by distilling in a glass vessel, with so long a neck that the vapours were condensed before they escaped at the upper extremity, or by inverting one matrass within another.

When corrosive substances are distilled in this way, the cucurbit and alembic are used; but these substances are more conveniently distilled *per latus*.

The distillation *per latus* is performed in a retort, or pear-shaped vessel having the neck bent to one side. The body of a good retort is well rounded, uniform in its appearance, and of an equal thickness, and the neck is sufficiently bent to allow the vapours, when condensed, to run freely away, but not so much as to render the application of the receiver inconvenient, or to bring it too near the furnace. The passage from the body into the neck must be perfectly free and sufficiently wide, otherwise the vapours produced in the retort only circulate in its body, without passing over into the receiver. For introducing liquors into the retort without soiling its neck, which would injure the product, a bent funnel is necessary. It must be sufficiently long to introduce the liquor directly into the body of the retort; and in withdrawing it, we must carefully keep it applied to the upper part of the retort, that the drop hanging from it may not touch the inside of the neck. In some cases, where a mixture of different substances is to be distilled, it is convenient and necessary to have the whole apparatus properly adjusted before the mixture is made, and we must therefore employ a tubulated retort, or a retort furnished with an aperture, accurately closed with a ground stopper.

This tubulature should be placed on the upper convex part of the retort before it bends to form the neck, so that a fluid poured through it may fall directly into the body without soiling the neck.

Retorts are made of various materials. Flint glass is commonly used when the heat is not so great as to melt it. For distillations which require excessive degrees of heat, retorts of earthen-ware,

PHARMACY.

or coated glass retorts, are employed. Quick-silver is distilled in iron retorts.

The simplest condensing apparatus used with the retort, is the common glass-receiver; which is a vessel of a conical or globular form, having a neck sufficiently wide to admit of the neck of the retort being introduced within it. To prevent the loss and dissipation of the vapours to be condensed, the retort and receiver may be accurately ground to each other, or secured by some proper lute. To prevent the receiver from being heated by the caloric evolved during the condensation of vapours in it, we must employ some means to keep it cool.

It is either immersed in cold water, or covered with snow, or pounded ice, or a constant evaporation is supported from its surface, by covering it with cloth, which is kept moist by means of the descent of water, from a vessel placed above it, through minute syphons or spongy worsted threads. But as, during the process of distillation, permanently elastic fluids are often produced, which would endanger the breaking of the vessels, these are permitted to escape either through a tubulature, or hole in the side of the receiver, or rather through a hole made in the luting. Receivers having a spout issuing from their side are used when we wish to keep separate the products obtained at different periods of any distillation. For condensing very volatile vapours, a series of receivers, communicating with each other, termed adopters, were formerly used; but these are now entirely superseded by Woulfe's apparatus, which consists of a tubulated retort, adapted to a tubulated receiver. With the tubulature of the receiver a three-necked bottle is connected by means of a bent tube, the further extremity of which is immersed, one or more inches, in some fluid contained in the bottle. A series of two or three similar bottles are connected with this first bottle in the same way. In the middle tubulature of each bottle a glass tube is fixed, having its lower extremity immersed about a quarter of an inch in the fluid. The height of the tube above the surface of the fluid must be greater than the sum of the columns of fluids standing over the further extremities of the connecting tubes, in all the bottles or vessels more remote from the retort. Tubes so adjusted are termed tubes of safety, for they prevent that reflux of fluid from the more remote into the nearer bottles, and into the receiver itself, which would otherwise inevitably happen, on any condensation of vapour taking place in the retort, receiver, or nearer bottles. Different contrivances for the same purpose have been described by Messrs. Welter and Burkitt; and a very ingenious mode of connecting the vessels without lute, has been invented by citizen Girard, but they would not be easily understood without plates. The further tubulature of the last bottle is commonly connected with a pneumatic apparatus, by means of a bent tube. When the whole is properly adjusted, air blown into the retort should pass through the receiver, rise in bubbles through the fluids contained in each of the bottles, and at last escape by the bent tube. In the receiver, those products of distillation are collected, which are condensable by cold alone. The first bottle is commonly filled with water, and the others with alkaline solutions, or other active fluids; and as the permanently elastic fluids produced are successively subjected to the action of all these, only those gasses will escape by the bent tube which are not absorbable by any of them.

In separating permanently elastic fluids or gasses from the substances in which they are found, we

are compelled to employ a distinct pneumatic apparatus; and the gass may then be received either into vessels absolutely empty, or filled with some fluid on which it exerts no action.

The first mode of collecting gasses may be practised by means of a bladder, moistened sufficiently to make it perfectly pliable, and then compressed so as to press out every particle of air from its cavity. In this state it may be easily filled with any gass. An oiled silk bag will answer the same purpose, and is more convenient in some respects, as it may be made of any size or form.

Glass or metallic vessels, such as balloons, may also be emptied for the purpose of receiving gasses, by fitting them with a stop-cock, and exhausting the air from them by means of an air-pump.

But the second mode of collecting gasses is the most convenient and common. In which case the vessels may be filled either with a fluid lighter, or heavier than the gass to be received into it.

The former method is seldom employed; but if we conduct a stream of any gass heavier than atmospheric air, such as carbonic acid gass, muriatic acid gass, &c. to the bottom of any vessel, it will gradually displace the air, and fill the vessel.

On the contrary, a gass lighter than atmospheric air, such as hydrogen, may be collected in an inverted vessel by conducting a stream of it to the top.

But gasses are most commonly collected by conducting the stream of gass into an inverted glass jar, or any other vessel filled with water or mercury. The gass ascends to the upper part of the vessel, and displaces the fluid. In this way gass may be kept a very long time, provided a small quantity of the fluid be left in the vessels, which prevents both the escape of the gass and the admission of atmospheric air.

The vessels may be of various shapes; but those most commonly employed are cylindrical. They may be either open only at one extremity, or furnished at the other with a stop-cock.

The manner of filling them with fluid is to immerse them completely in it, with the open extremity directed a little upwards, so that the whole air may escape from them, and then inverting them with their mouths downwards.

For filling them with convenience, a trough or cistern is commonly used. This should either be hollowed out of a solid block of wood or marble; or, if it be constructed of wood simply, be well painted or lined with lead or tinned copper. Its size may vary very much; but it must contain a sufficient depth of fluid to cover the largest transverse diameter of the vessels to be filled in it. At one end or side there should be a shelf for holding the vessels after they are filled. This shelf should be placed about an inch and a half below the surface of the fluid, and should be perforated with several holes, forming the apices of corresponding conical excavations, on the lower side, through which, as through inverted funnels, gaseous fluids may be more easily introduced into the vessels placed over them.

In general the vessels used with a mercurial apparatus should be stronger and smaller than those for a water cistern, and we must have a variety of glass and elastic tubes for conveying the gasses from the vessels in which they are formed to the funnels under the shelf.

The repeated distillation of any fluid is denominated rectification. When distillation renders the fluid stronger, or abstracts water from it, it is termed dephlegmation. When a fluid is distilled

PHARMACY.

off from any substance, it is called abstraction: and if the product be redistilled from the same substance, or a fresh quantity of the same substance, it is denominated cohobation.

The difference between distillation and sublimation is only in the form of the product. When it is compact, it is termed a sublimate; when loose and spongy, it formerly had the appellation of flowers. Sublimation is sometimes performed in a crucible, and the vapours are condensed in a paper cone, or in another crucible inverted over it; sometimes in the lower part of a glass flask, cucurbit or phial, and the condensation is effected in the upper part or capital, and sometimes in a retort with a very short and wide neck, to which a conical receiver is fitted. The heat is most commonly applied through the medium of a sand-bath; and the degree of heat, and the depth to which the vessel is inserted in it, are regulated by the nature of the sublimation.

Congelation is the reduction of a fluid to a solid form, in consequence of the abstraction of caloric. The means employed for abstracting the caloric are the evaporation of volatile fluids, the solution of solids, and the contact of cold bodies.

Congelation is the conversion of a fluid into a solid of greater or less consistence, merely in consequence of a new arrangement of its particles, as during the process there is no separation of caloric or any other substance. The means of producing coagulation are increase of temperature, and the addition of certain substances, as acids and runners.

Chemical combination is the intimate union of the particles of at least two heterogeneous bodies. It is the effect resulting from the exertion of the attraction of affinity, and is therefore subjected to all the laws of affinity.

To produce the chemical union of any two or more bodies, it is necessary that they possess an affinity for each other; that their particles come into actual contact; that the strength of the affinity be greater than any counteracting causes which may be present.

The principal counteracting causes are, the attraction of aggregation, and affinities for other substances. The means to be employed for overcoming the action of other affinities will be treated of under Decomposition. The attraction of aggregation is overcome by means of mechanical division, or the action of caloric.

Combination is facilitated by increasing the points of actual contact, by the means of mechanical agitation: by condensation and compression. And the processes employed for producing combination may be considered with regard to the nature of the substances combined; and, to the nature of the compound produced. Gases combine with gases; and dissolve fluids or solids; or are absorbed by them. Fluids are dissolved in gases, or absorb them. They combine with fluids, and dissolve solids; or are rendered solid by them. Solids are solved in fluids and in gases; or absorb gases and solidify fluids.

The combination of gases with each other, in some instances, takes place when simply mixed together; thus nitrous and oxygen gases combine as soon as they come into contact; in other instances, it is necessary to elevate their temperature to a degree sufficient for their inflammation, either by means of the electric spark, or the contact of an ignited body, as in the combination of oxygen gas with hydrogen or nitrogen gas.

When gases combine with each other there is

always a considerable diminution of bulk, and not unfrequently they are condensed into a liquid or solid form. Hydrogen and oxygen gases form water; muriatic acid and ammonia gases form solid muriate of ammonia. But when the combination is effected by ignition, a violent expansion, which endangers the bursting of the vessels, previously takes place, in consequence of the increase of temperature.

Solution is the diminution of aggregation in any solid or fluid substance, in consequence of its entering into chemical combination. The substance, whether solid or fluid, whose aggregation is lessened, is termed the solvent; and the substance by whose agency the solution is effected is often called the menstruum or solvent.

Solution is said to be performed *vis humidâ*, when the natural form of the solvent is fluid; but when the agency of heat is necessary to give the solvent its fluid form, the solution is said to be performed *vis siccâ*.

The dissolving power of each menstruum is limited, and is determinate with regard to each solvent. The solubility of bodies is also limited and determinate with regard to each menstruum.

When any menstruum has dissolved the greatest possible quantity of any solvent, it is said to be saturated with it. But, in some cases, although saturated with one substance, it is still capable of dissolving others. Thus a saturated solution of muriat of soda will dissolve a certain quantity of nitrat of potass, and after that a portion of muriat of ammonia.

The dissolving power of solvents, and consequently the solubility of solvents, are generally increased by increase of temperature: and conversely, this power is diminished by diminution of temperature; so that, from a saturated solution, a separation of a portion of the solvent generally takes place on any reduction of temperature. This property becomes extremely useful in many chemical operations, especially in crystallization.

Particular terms have been applied to particular cases of solution.

The solution of a fluid in the atmosphere is termed spontaneous evaporation. It is promoted by exposing a large surface, by frequently renewing the air in contact with the surface, and by increase of temperature.

Some solids have so strong an affinity for water, that they attract it from the atmosphere in sufficient quantity to dissolve them. These are said to deliquesce. Others, on the contrary, retain their water of crystallization with so weak a force, that the atmosphere attracts it from them, so that they crumble into powder. These are said to effloresce. Both operations are promoted by exposing large surfaces, and by a current of air; but the latter is facilitated by a warm dry air, and the former by a cold humid atmosphere.

Solution is also employed to separate substances, (for example, saline bodies), which are soluble in the menstruum, from others which are not.

When our object is to obtain the soluble substance in a state of purity, the operation is termed lixiviation, and as small a quantity of the menstruum as is possible is used. When, however, it is employed to free an insoluble substance from soluble impurities, it is termed edulcoration, which is best performed by using a very large quantity of the menstruum.

Organic products being generally composed of

PHARMACY.

heterogeneous substances, are only partially soluble in the different menstrua. To the solution of any of these substances while the others remain undissolved, the term extraction is applied; and when, by evaporation, the substance extracted is reduced to a solid form, it is termed an extract, which is hard or soft, watery or spiritous, according to the degree of consistency it requires, and the nature of the menstruum employed.

Infusion is employed to extract the virtues of aromatic and volatile substances, which would be dissipated by decoction, and destroyed by maceration, and to separate substances of easy solution from others which are less soluble. The process consists in pouring upon the substance to be infused, placed in a proper vessel, the menstruum, either hot or cold, according to the direction, covering it up, agitating it frequently, and after a due time straining or decanting off the liquor, which is now termed the infusion.

Maceration differs from infusion, in being continued for a longer time, and can only be employed for substances which do not easily ferment or spoil.

Digestion, on the other hand, differs from maceration only in the activity of the menstruum being promoted by a gentle degree of heat. It is commonly performed in a glass matrass, which should only be filled one third, and covered with a piece of wet bladder, pierced with one or more small holes, so that the evaporation of the menstruum may be prevented as much as possible, without risk of bursting the vessel. The vessel may be heated, either by means of the sun's rays, of a common fire, or of the sand-bath; and when the last is employed, the vessel should not be sunk deeper in the sand than the portion that is filled. Sometimes, when the menstruum employed is valuable, a distilling apparatus is used to prevent any waste of it. At other times, a blind capital is luted on the matrass, or a smaller matrass is inverted within a larger one; and as the vapour which arises is condensed in it, and runs back into the larger, the process in this form has got the name of circulation, upon which we have observed already.

Decoction is performed by subjecting the substances operated on to a degree of heat which is sufficient to convert the menstruum into vapour, and can only be employed with advantage for extracting principles which are not volatile, and from substances whose texture is so dense and compact as to resist the less active methods of solution. When the menstruum is valuable, that portion of it which is converted into vapour is generally saved by condensing it in a distilling apparatus.

Solutions in alcohol are termed tinctures, and in vinegar or wine, medicated vinegars or wines. The solution of metals in mercury is termed amalgamation. The combinations of other metals with each other form alloys.

Absorption is the condensation of a gas into a fluid or solid form, in consequence of its combination with a fluid or solid. It is facilitated by increase of surface and agitation; and the power of absorption in fluids is much increased by compression and diminution of temperature, although in every instance it be limited and determinate. Dr. Nouth invented an ingenious apparatus for combining gases with fluids, and Messrs. Schweppe, Paul, and Cuthbertson, have very advantageously employed compression.

Fluids often become solid by entering into

combination with solids, and this change is always accompanied by considerable increase of temperature, as in the slaking of lime.

Chemical decomposition is the separation of the elementary parts of bodies which were chemically combined, and can only be effected by the agency of substances possessing a stronger affinity for one or more of the constituents of the compound than these possess for each other.

Decomposition has acquired various appellations, according to the phenomena which accompany it.

Dissolution differs from solution in being accompanied by a decomposition or change in the nature of the substance dissolved. Thus, we correctly say, a solution of lime in muriatic acid, and a dissolution of chalk in muriatic acid.

Sometimes a gas is separated during the action of bodies on each other. When this escapes with considerable violence and agitation of the fluid, it is termed effervescence. The gas is very frequently allowed to escape into the atmosphere, but at other times is either collected in a pneumatic apparatus, or made to enter into some new combination. The vessels in which an effervescing mixture is made should be high and sufficiently large, to prevent any loss of the materials from their running over, and in some cases the mixture must be made slowly and gradually.

Precipitation is the reverse of solution. It comprehends all those processes in which a solid is obtained by the decomposition of a solution. The substance separated is termed a precipitate, if it sink to the bottom of the fluid; or a cream, if it swim above it. Precipitation, like solution, is performed either *vis humida* or *vis sicca*; and is effected by lessening the quantity of the solvent by evaporation; by diminishing its powers, as by reduction of temperature, or dilution; or by the addition of some chemical agent, which form its more powerful affinities. Either combines with the solvent, and precipitates the solvent; or forms itself an insoluble compound with some constituent of the solution.

The objects of precipitation are, the separation of substances from solutions in which they are contained; the purification of solutions from precipitable impurities; or the formation of new combinations.

The two first means of precipitation have been already noticed.

In performing it in the last manner, we may observe the following rules: the solution and precipitant must possess the requisite degree of purity. The solution should be perfectly saturated, to avoid unnecessary expenditure of the solvent or precipitant. The one is to be added slowly and gradually to the other. After each addition, they are to be thoroughly mixed by agitation. We must allow the mixture to settle, after we think that enough of the precipitant has been added, and try a little of the clear solution, by adding to it some of the precipitant; if any precipitation takes place, we have not added enough of the precipitant. This is necessary, not only to avoid loss, but in many instances, the precipitant, if added in excess, re-dissolves or combines with the precipitate.

After the precipitation is completed, the precipitate is to be separated from the supernatant fluid by some of the means already noticed.

When the precipitate is the chief object of our process, and when it is not soluble in water, it is often advisable to dilute, to a considerable degree,

PHARMACY

both the solution and precipitant, before performing the operation. When it is only difficultly soluble, we must content ourselves with washing the precipitate, after it is separated by filtration. In some cases the separation of the precipitate is much assisted by a gentle heat.

Crystallization is a species of precipitation, in which the particles of the solvent, on separating from the solution, assume certain determinate forms.

The conditions necessary for crystallization are, that the integrant particles have a tendency to arrange themselves in a determinate manner, when acted on by the attraction of aggregation; that they be disaggregated, at least so far as to possess sufficient mobility to assume their peculiar arrangement; and that the causes disaggregating them be slowly and gradually removed.

Notwithstanding the immense variety in the forms of crystals, M. Haüy has rendered it probable that there are only three forms of the integrant particles; the parallelopiped, the triangular prism, and the tetrahedron. But as these particles may unite in different ways, either by their faces or edges, they will compose crystals of various forms.

The primitive forms have been reduced to six: the parallelopiped; the regular tetrahedron; the octahedron with triangular faces; the six-sided prism; the dodecahedron terminated by rhombs; the dodecahedron with isoscles triangular faces.

Almost all substances, on crystallizing, retain a portion of water combined with them, which is essential to their existence as crystals, and is therefore denominated water of crystallization. Its quantity varies very much in different crystallizable substances.

The means by which the particles of bodies are disaggregated, so as to admit of crystallization, are solution, fusion, vaporization, or mechanical division and suspension in a fluid medium.

The means by which the disaggregating causes are removed are, evaporation, reduction of temperature, and rest.

When bodies are merely suspended in a state of extreme mechanical division, nothing but rest is necessary for their crystallization.

When they are disaggregated by fusion or vaporization, the regularity of their crystals depends on the slowness with which their temperature is reduced; for if cooled too quickly, their particles have not time to arrange themselves, and are converted at once into a confused or unvaried solid mass. Thus glass, which, when cooled quickly, is so perfectly uniform in its appearance, when cooled slowly has a crystalline texture. But in order to obtain crystals by means of fusion, it is often necessary, after the substance has begun to crystallize, to remove the part which remains fluid, for otherwise it would fill up the interstices among the crystals first formed, and give the whole the appearance of one solid mass. Thus, after a crust has formed on the top of melted sulphur, by pouring off the still fluid part, we obtain regular crystals.

The means by which bodies, which have been disaggregated by solution, are made to crystallize most regularly, vary according to the habitues of the bodies with their solvents and caloric.

Some saline substances are much more soluble in hot than in cold water. Therefore a boiling saturated solution of any of these will deposite, on cooling, the excess of salt, which it is unable to

dissolve, when cold. These salts commonly contain much water of crystallization. Other salts are scarcely, if at all, more soluble in hot than in cold water; and, therefore, their solutions must be evaporated either by heat or spontaneously. These salts commonly contain little water of crystallization.

The beauty and size of the crystals depend upon the purity of the solution, its quantity, and the mode of conducting the evaporation, and cooling.

When the salt is not more soluble in hot than in cold water, by means of gentle evaporation a succession of pellicles are formed on the top of the solution, which either are removed or permitted to sink to the bottom by their own weight; and the evaporation is continued until the crystallization be completed.

But when the salt is capable of crystallizing on cooling, the evaporation is only continued until a drop of the solution, placed upon some cold body, shews a disposition to crystallize, or at farthest only until the first appearance of a pellicle. The solution is then covered up, and set aside to cool, and the more slowly it cools, the more regular are the crystals. The mother-water or solution, which remains after the crystals are formed, may be repeatedly treated in the same way as long as it is capable of furnishing any more salt.

When very large and beautiful crystals are wanted, they may be obtained by laying well-formed crystals in a saturated solution of the same salt, and turning them every day. In this way their size may be considerably increased, though not without limitation, for after a certain time they grow smaller instead of larger.

Crystallization is employed to obtain crystallizable substances in a state of purity; or to separate them from each other, by taking advantage of their different solubility at different temperatures.

General Analyses resulting from the application of Chemical Powers.

The simple elementary substances into which bodies have hitherto been supposed capable of being reduced when submitted to chemical action are light, caloric, electricity, galvanism, magnetism, oxygen, hydrogen, nitrogen, carbon, sulphur, soda, potash, phosphorus, metals, and earths. Of these the first five have no appreciable gravity, which is evinced by all the rest. Of the latter, again, some are combustible, others incombustible; some oxygenizable, others destitute of all affinity for oxygen. But to enter minutely into these subjects would be to transgress the limits of pharmacy, and to infringe upon those which belong to CHEMISTRY as a general science, and to which we refer the reader for farther information. Our object at present is only to take such notice of the above simple substances, as they are called, to which bodies are capable of being reduced, as is more immediately connected with pharmaceutical chemistry, and a knowledge of which is absolutely necessary to the medical practitioner, in order that he may be apprised of the new powers assumed by the materials he employs in the more important changes they undergo, and may be able, with the greater readiness, to ascertain the nature and extent of their action. So little progress, however, have we hitherto made in the general science of chemistry, that perhaps we are even now committing a double error in offering the above as a table of simple elementary substances. It is possible that not one of

PHARMACY.

these substances is, strictly speaking, a simple element; or, in other words, totally uncompounded of rudiments that are more simple. We may also be in an error in conceiving every one of them to be a distinct substance from every other: we have many reasons, for example, for supposing that galvanism and electricity are the very same substance, only in different states of modification; and some philosophers have ventured to suspect magnetism, or the magnetic power, is, in like manner, in unity with both.

Neither soda nor potass, again, are any longer to be regarded as simple substances, but mere oxyds of very extraordinary metals, as have been sufficiently ascertained by the valuable experiments of Mr. Davy, who has denominated these metals *SODIUM* and *POTASSIUM*, to the articles contained under which terms we refer our readers.

The earths have perhaps as little claim to simplicity: many of them have been already proved to be metallic oxyds, and the rest will probably follow the same fate. There are also several of the acids which are still admitted into the same division, but whose pretensions are every day becoming still more doubtful; and of which, on this very account, we have taken no notice.

This observation, which will certainly apply to various of the acids hitherto regarded as simple substances, may perhaps apply to all of them. Whatever theory may ultimately prevail with respect to oxymuriatic acid, the compound form of muriatic acid, till of late regarded as one of the simple substances, will still remain as a point universally admitted. The fluoric and boracic acids appear equally to have been decomposed by Mr. Davy, and reduced to their respective elements.

By the same train of experiments, sulphur, charcoal, and phosphorus, have been determined to be compounds; ammonia, though it has not, like the other alkalies, been reduced to a metallic state, has made so far a progress towards it as to have formed an amalgam with quicksilver; and the existence of nitrogen and hydrogen has been called in question, and upon grounds highly plausible, though by no means satisfactory.

Were all these points fully established, we should indeed be reduced to a very small catalogue of simple substances, for nothing would then remain to us but oxygen, light, electricity, and the metallic bases of bodies, which would constitute the four modern elements of the world, as fire, air, earth, and water, constituted those of former times, not one of which is now suffered to exist as an element.

As some compensation, however, for the sweeping destruction and vast hiatus which is hereby produced, it is possible that a variety of new elements or simple substances may yet obtain an acknowledged existence. Oxymuriatic acid, which was not long since conceived not only a compound but a compound of a compound, has for the last two or three years been generally regarded as a substance altogether as simple as oxygen, to which it offers a very striking resemblance; and although this hypothesis is not yet perhaps fully established, and is certainly opposed by various chemists of considerable reputation, the very numerous, ingenious, and accurate experiments of Mr. Davy, upon which it reposes, are of a very commanding character, and require but a very little to set the question completely at rest. He has hence banished the old name of oxymuriatic acid in favour of that of chlorine, in consequence of its yellow-green colour.

At present, however, we are not aware of a claim

put in for the actual simplicity of any other substance hitherto supposed to have been compound: but as the door is open, such facts may follow, though for the general security and permanency of scientific principles it is to be trusted they will not. See the articles *OXYMURIATIC ACID*, *POTASSIUM*, *SODIUM*, *SULPHUR*, &c.

In the present uncertain state of chemical science, however, it is not perhaps possible, and if possible, certainly would not be expedient, to relinquish the general principles which have hitherto been supposed to be established, while treating upon a subject of such high practical consequence and importance as that of pharmacy: and hence, though we have thought it right to follow up the actual state of analytic investigation to the existing period, by noticing the most recent experiments and opinions, we must for the present leave them where they are till they shall appear before us in a form that shall command our conviction, and compel us to allow them a local habitation within the region of medicine in consequence of their being universally allowed to possess such an habitation without it.

PART II.—PHARMACEUTICAL PREPARATIONS.

The classes into which these are divided have a considerable difference, as well in number as in arrangement in our different collegiate pharmacopœias: all of which have endeavoured to keep pace in some degree with the progress of science, not only in adopting more expert and accurate modes of preparing chemical compounds, and in selecting new simple materials of high character and reputation, which cannot but be approved of, but in employing, to a very considerable, we had almost said a licentious extent, the new names under which the faction or caprice, as well as the improved knowledge of the day, have compelled us to recognize many an old acquaintance.

Nothing, however, of real moment has hitherto been attempted by any of them in the way of systematic arrangement—a point we certainly did expect to find would have met with some attention in the latest of our national pharmacopœias, we mean that of the London college. As this, however, has not been done for us, we must attempt it as well as we are able for ourselves, under the following form:

1. Acida,	Acids.
2. Alkalina,	Alkalines.
3. Terrea,	Earths.
4. Sulphurea,	Sulphureous preparations.
5. Metallica,	Metallic preparations.
6. Olea fixata,	Fixed oils.
7. Aquæ distillatæ,	Distilled waters.
8. Olea volatilâ,	Volatile oils.
9. Spiritus distillati,	Distilled spirits.
10. Decocta,	Decoctions.
11. Infusa,	Infusions.
12. Mucilagines,	Mucilages.
13. Syrupa,	Syrups.
14. Mellita,	Medicated honeys.
15. Misturæ et emulsiones,	Mixtures and emulsions.
16. Acetæ,	Medicated vinegars.
17. Tincturæ,	Tinctures.
18. Ætheræ,	Etherials and alcohols.
19. Vina,	Medicated wines.
20. Extracta,	Extracts.
21. Pulveres,	Powders.
22. Confectiones,	Confections.
23. Trochisci,	Troches.
24. Pilulæ,	Pills.

PHARMACY.

25. Cataplasms,	Cataplasms.
26. Linimenta,	Liniments.
27. Unguenta,	Ointments.
28. Cerata,	Cerates.
29. Emplastra,	Plasters.

CLASS I.—*Acida. Acids.*

The preparations under this name chiefly in use, and for which forms are given in the modern college dispensaries, are,

Sulphuric or vitriolic,
Diluted sulphuric,
Nitric,
Diluted nitric,
Muriatic,
Vinegar, or acetic acid distilled,
Benzoic,
Succinic.

Nitrous acid is frequently impure. Sulphuric acid is easily got rid of by re-distilling the nitrous acid from a small quantity of nitrat of potass. But its presence is not indicated when nitrous acid forms a precipitate with nitrat of baryt, as affirmed by almost all chemical authors; for nitrat of baryt was discovered by Mr. Hume to be insoluble in nitrous acid.

Muriatic acid is detected by the precipitate formed with nitrat of silver, and may be separated by dropping into the nitrous acid a solution of nitrat of silver, as long as it forms any precipitate, and drawing off the nitrous acid by distillation.

The general properties of nitrous acid have been already noticed. Mr. Davy has shown that it is a compound of nitric acid and nitric oxyd, and that by additional doses of the last constituent its colour is successively changed from yellow to orange, olive-green, and blue-green; and its specific gravity is diminished.

Vinegar may be distilled either in a common still or in a retort. The better kinds of wine-vinegar should be used. Indeed, with the best kind of vinegar, if the distillation be carried on to any great length, it is extremely difficult to avoid empyreuma. The best method of preventing this inconvenience is, if a retort be used, to place the sand but a little way up its sides, and when somewhat more than half the liquor is come over, to pour on the remainder a quantity of fresh vinegar equal to the liquor drawn off. This may be repeated three or four times; the vinegar supplied at each time being previously heated. The addition of cold liquor would not only prolong the operation, but also endanger the breaking of the retort.

Lowitz recommends the addition of half an ounce of recently-burnt and powdered charcoal to each pound of vinegar in the still, as the best means of avoiding empyreuma.

If the common still be employed, it should likewise be occasionally supplied with fresh vinegar, in proportion as the acid runs off, and this continued until the process can be conveniently carried no farther. The distilled acid must be rectified by a second distillation in a retort or glass alembic; for although the head and receiver be of glass or stone ware, the acid will contract a metallic taint from the pewter worm.

The residuum of this process is commonly thrown away as useless, although, if skilfully managed, it may be made to turn to good account, the strongest acid still remaining in it. Mixed with about three times its weight of fine dry sand, and committed to distillation in a retort, with a

well-regulated fire, it yields an exceedingly strong empyreumatic acid. It is, nevertheless, without any rectification, better for some purposes, as being stronger, than the pure acid; particularly for making acetate of potass or soda: for then the empyreumatic oil is burnt out.

Distilled vinegar should be colourless and transparent; have a pungent smell, and purely acid taste, totally free from acrimony and empyreuma, and should be entirely volatile. It should not form a black precipitate on the addition of a solution of baryta, or of water saturated with sulphuretted hydrogen; or change its colour when super-saturated with ammonia. These circumstances show, that it is adulterated with sulphuric acid, or contains lead, copper, or tin.

Distilled acetic acid, in its effects on the animal economy, does not differ from vinegar, and as it is less pleasant to the taste, it is only used for pharmaceutical preparations.

CLASS II.—*Alkalina. Alkalines.*

The following are the chief preparations under this head:

Carbonas potassæ. Carbonat of potass, Lond. Edin. Prepared kali; mild vegetable alkali; salt of tartar.

Potassa fusa, Lond. Pure kali; caustic vegetable alkali.

Potassa cum calce. Lime with pure kali; mild caustic.

Aqua potassæ, Edin. Lond. Water of potass; caustic ley.

Acetis potassæ, Edin. Acetite of potass; acetated kali, Lond.

Acetas potassæ, Lond. Acetate of potass.

Sulphas potassæ, Edin. Lond. Sulphate of potass; vitriolated tartar.

Carbonas potassæ, et subcarbonas, Lond. Vitriolated kali.

Sulphas potassæ, et sulphure, Edin. Lond. Sulphate of potass with sulphur; sal polychres.

Sulphuretum potassæ, Edin. Lond. Sulphuret of potass; liver of sulphur.

Supersulphas potassæ, Lond.

Tartris potassæ, Edin. Tartrate of potass; soluble tartar; tartarised kali.

Tartras potassæ, Lond.

Carbonas sodæ, Edin. Lond. Carbonate of soda; prepared natron.

Phosphas sodæ, Edin. Lond. Phosphate of soda. Murias sodæ. Muriate of soda; sea-salt.

Sulphas sodæ, Edin. Lond. Sulphate of soda. Natron vitriolatum. Glauber's salt.

Tartris sodæ, Ed. Tartrate of soda. Natron tartarisatum, old Lond. Rochelle salt.

Alcohol ammoniatum, Ed. Ammoniated alcohol; spirit of ammonia, Lond.

Carbonas ammoniæ, Ed. Lond. Carbonate of ammonia; prepared ammonia.

Aqua carbonatis ammoniæ, Ed. Water of carbonate of ammonia.

Liquor carb. ammon. Lond.

Aqua acetitis ammoniæ, Edin. Water of acetite of ammonia; spirit of mindererus.

Hydrosulphuretum ammoniæ. Hydrosulphuret of ammonia.

CLASS III.—*Terrena. Earths and earthy Salts.*

The following are the preparations chiefly in use.

Murias barytæ. Muriate of baryt, Edin.

Liquor calcis, Lond.

Aqua calcis. Lime-water. Edin. Dubl.

Calx, Lond.

PHARMACY.

Carbonas calcis præparatus. Prepared chalk, Lond. Carbonat of lime, Edin.

Phosphas calcis, Edin. Phosphat of lime; burnt hartshorn, Lond.

Magnesia, Lond.

Carbonas magnesiæ, Edin. Lond. Magnesia alba, Dubl. Carbonat of magnesia.

Phosphas calcis, Edin. Magnesia usta, old Lon. Burnt or calcined magnesia.

Sulphas aluminæ exsiccat, Edin. Dried sulphat of alumine; burnt alum.

Alumen exsiccatum, Lond.

In the Dublin process for making magnesia there is a mutual decomposition of the two salts employed. The potass unites itself to the sulphuric acid, while the carbonic acid combines with the magnesia. The large quantity of water used is necessary for the solution of the sulphat of potass formed; and the boiling is indispensably requisite for the expulsion of a portion of the carbonic acid, which retains a part of the magnesia in solution. Sulphat of potass may be obtained from the liquor which passes through the filter, by evaporation. This is not pure, however, but mixed with undecomposed carbonat of potass; for 100 parts of crystallized carbonat of potass are sufficient for the decomposition of 125 parts of sulphat of magnesia; and as the carbonat of potass of commerce contains a larger proportion of alkali than the crystallized carbonat, a still less proportion should be used. From these quantities about 45 parts of carbonat of magnesia are obtained.

The ablutions should be made with very pure water; for nicer purposes distilled water may be used, and soft water is in every case necessary. Hard water for this process is peculiarly inadmissible, as the principle in waters, giving the property called hardness, is generally a salt of lime, which decomposes the carbonate of magnesia, by compound affinity, giving rise to carbonate of lime, while the magnesia unites itself to the acid of the calcareous salt, by which the quantity of the carbonate is not only lessened, but is rendered impure by the admixture of carbonate of lime. Another source of impurity is the silica which the subcarbonate of potass generally contains. It is most easily got rid of by exposing the alkaline solution to the air for several days before it is used. In proportion as it becomes saturated with carbonic acid, the silica is precipitated, and may be separated by filtration.

The carbonat of magnesia thus prepared is a very light, white, opaque substance, without smell or taste, effervescing with acids. It is not, however, saturated with carbonic acid. By decomposing sulphat of magnesia by an alkaline carbonat, without the application of heat, carbonat of magnesia is gradually deposited in transparent, brilliant, hexagonal crystals, terminated by an oblique hexagonal plane, and soluble in about 460 times its weight of water. The crystallized carbonat of magnesia consists of 50 acid, 25 magnesia, and 25 water; the sub-carbonat consists of 48 acid, 40 magnesia, and 12 water; and the carbonat of commerce of 34 acid, 45 magnesia, and 21 water. It is decomposed by all the acids, potass, soda, baryta, lime, and strontian, the sulphat, phosphat, nitrat, and muriat of alumina, and the super-phosphat of lime.

CLASS IV.—Sulphurea.

The preparations under this head are few: we need only enumerate the two following.

Sulphur lotum, Lond. Washed flowers of sulphur.

Sulphur præcipitatum, Lond. Precipitated sulphur.

In preparing this last, instead of dissolving sulphuret of potass in water, we may gradually add sublimed sulphur to a boiling solution of potass, until it be saturated. When the sulphuretted potass is thrown into water, it is entirely dissolved, but not without decomposition, for it is converted into sulphat of potass, hydroguretted sulphuret of potass, and sulphuretted hydroguret of potass. The two last compounds are again decomposed on the addition of any acid. The acid combines with the potass, sulphuretted hydrogen flies off in the form of gas, while sulphur is precipitated. It is of little consequence what acid is employed to precipitate the sulphur. The London college order the sulphuric; while the Dublin college use nitrous acid, probably because the nitrat of potass formed is more easily washed away than sulphat of potass.

Precipitated sulphur does not differ from well-washed sublimed sulphur, except in being much dearer. Its paler colour is owing to its more minute division, or according to Dr. Thomson, to the presence of a little water; but from either circumstance it derives no superiority to compensate for the disagreeableness of its preparation.

These are all the more simple preparations of sulphur in common use. There are various preparations into which sulphur enters as an ingredient, but these, as constituting compounds of the general nature of metals, alkalines, oils, &c. will be found under those classes.

CLASS V.—Metallica. Metalline preparations.

The metalline preparations are very numerous; especially those of antimony and quicksilver.

Antimonii oxydum, Lond.

Sulphuretum antimonii præparatum, Lond. Ed. Prepared antimony.

Oxydum antimonii cum sulphure per nitratem potasse, Edin. Crocus of antimony, Lond.

Oxydum antimonii cum sulphure. Vitrified antimony, Edin. Glass of antimony.

Sulphuretum antimonii præcipitatum. Precipitated sulphuret, or sulphur of antimony, Lond.

Murias antimonii, Edin. Muriated antimony; butter of antimony.

Oxydum antimonii cum phosphate calcis, Edin. Pulvis antimonialis, Lond. Antimonial powder.

Tartris antimonii. Tartarized or tartrit of antimony.

Antimonium tartarisatum, Lond. Tartar emetic.

Vinum tartritis antimonii, Edin. Antimonial wine.

Liquor antimonii tartarisati, Lond.

Nitras argenti, Lond. Edin. Nitrat of silver; lunar caustic.

Arsenici oxydum præparatum, Lond. Prepared oxyd of arsenic.

Ærugo præparata, Dubl. Prepared verdigrise, or carbonat of copper.

Solutio sulphatis cupri composita, Edin. Styptic water.

Cuprum ammoniatum, Lond.

Ammoniæretum cupri, Edin. Ammoniacal copper.

Liquor cupri ammoniati, Lond. Water of the same.

Ferri limatura purificata, Edin. Purified iron filings.

Carbonas ferri, Edin. Lond. Carbonat or rust of iron.

PHARMACY.

Sulphas ferri, Edin. Lond. Vitriolated iron; sulphat of iron.

Tinctura muriatis ferri. Tincture of muriat of iron, Lond.

Murias ammoniæ et ferri. Martial flowers; ammoniacal iron.

Tinctura ejusdem. Tincture of the same.

Tinctura ferri ammoniati, Lond.

Vinum ferri, Lond. Wine of iron.

Hydrargyrus purificatus, Lond. Purified quicksilver.

Acetis hydrargyri, Edin. Acetite of quicksilver.

Murias hydrargyri, Edin. Lond. Muriat of quicksilver; corrosive sublimate.

Oxymurias hydrargyri, Lond. The same.

Submurias hydrargyri, Edin. Lond. Calomel.

Submurias hydrargyri præcipitatus, Edin. Mild muriated quicksilver.

Hydrargyrus præcipitatus albus, Lond. White precipitate.

Hydrargyrus calcinatus, Dubl. Lond. Calcined quicksilver.

Oxydum hydrargyri rubrum, Edin. Lond. Red precipitate.

Subsulphas hydrargyri flavus, Edin. Vitriolated quicksilver, Lond. Turpeth mineral.

Sulphuretum hydrargyri nigrum, Edin. Æthiops mineral.

Hydrargyri sulphuretum rubrum, Lond.

Hydrargyrus sulphuratum rubrum, Dubl. Facitious cinnabar.

Hydrargyri nitrico-oxydum, Lond.

Hydrargyri oxydum cinereum, Lond.

Acetis plumbi, Edin. Acetite of lead; sugar of lead.

Liquor plumbi acetatis, Lond. Extract of lead.

Plumbi superacetatis. Acetated cerussa, Lond.

Oxydum zinci, Edin. Lond. Oxyd of zinc; calcined zinc.

Carbonas zinci impurus præparatus, Edin. Prepared calamine.

Oxydum zinci impurum præparatum, Ed. Prepared tutty.

Sulphas zinci, Edin. Lond. Vitriolated zinc.

The antimonial powder of the London college is supposed to be nearly the same with the celebrated nostrum of Dr. James, the composition of which was ascertained by Dr. Pearson of London, to whom we are also indebted for the usual formula.

By burning sulphuret of antimony and shavings of hartshorn in a white heat, the sulphur is entirely expelled, and the antimony is oxydized, while the gelatine of the hartshorn is destroyed, and nothing is left but phosphat of lime, combined with a little lime. Therefore, the mass which results is a mixture of oxyd of antimony and phosphat of lime, which corresponds, at least as to the nature of the ingredients, with James's powder, which, by Dr. Pearson's analysis, was found to consist of 43 phosphat of lime, and 57 oxyd of antimony. Another excellent chemist, Mr. Chenevix, has lately proposed a method of forming the same combination in the humid way, with the view of obtaining a preparation always similar in its composition and properties. He was led to this proposal by considering the uncertainty of the application, and the precarious nature of the agency of fire, by which means a variable portion of the oxyd of antimony may be volatilized, and that which remains may be oxydized in various degrees.

Mr. Chenevix therefore proposes to prepare a substitute for James's powder, by dissolving together equal weights of submuriat of antimony and of phosphat of lime in the smallest possible quantity

of muriatic acid, and then pouring this solution gradually into water sufficiently alkalinized with ammonia. For the reason mentioned in the preceding article, it is absolutely necessary that the muriatic solution be poured into the alkaline liquor. By an opposite mode of procedure, the precipitate would contain more antimony at first, and towards the end the phosphat of lime would be predominant, and the antimony would be partly in the state of a submuriat. The phosphat of lime is most conveniently obtained pure by dissolving calcined bone in muriatic acid, and by precipitating it by ammonia. If the ammonia be quite free from carbonic acid, no muriat of lime is decomposed. Mr. Chenevix also found, that his precipitate is entirely soluble in every acid which can dissolve either phosphat of lime or oxyd of antimony separately, and that about 0.28 of James's powder, and at an average 0.44 of the pulvis antimonialis of the London Pharmacopœia, resist the action of every acid.

CLASS VI.—*Olea fixata. Fixed oils.*

These oils are improperly denominated expressed, which is their usual characteristic name, as in some instances they are obtained without expression, and in other instances expression is employed to obtain volatile oils. The Edinburgh college have therefore distinguished these different classes of oils by the terms Fixed and Volatile, which actually characterize them.

Fixed oil is seldom formed in any other part of vegetables than in their seeds. Sometimes, although very rarely, it is contained in the parenchyma of the fruit. Of this the best known example is the olive. But it is most commonly found in the seeds of dicotyledonous vegetables, sometimes also in the fruit of monocotyledonous plants, as the cocos butyracea. It has various degrees of consistency, from the tallow of the croton sebiferum of China, and the butter of the butter-tree of Africa, to the fluidity of olive oil.

Fixed oils are either, 1. Fat, easily congealed, and not inflammable by nitric acid, oil of olives, almonds, rapeseed, and ben. 2. Drying, not congealable, inflammable by nitric acid, oil of linseed, nut, and poppy. 3. Concrete oils, palm oil, &c.

Fixed oil is separated from fruits and seeds which contain it, either by expression or decoction. Heat, by rendering the oil more limpid, increases very much the quantity obtained by expression; but as it renders it less bland, and more apt to become rancid, heat is not used in the preparation of oils which are to be employed in medicine. When obtained by expression, oils often contain a mixture of mucilage, starch, and colouring matter; but part of these separate in course of time, and fall to the bottom. When oils become rancid, they are no longer fit for internal use, but are then said to effect the killing of quicksilver, as it is called, more quickly. Decoction is principally used for the extraction of the viscid and consistent oils, which are melted out by the heat of the boiling water, and rise to its surface.

Those who prepare large quantities of the oil of almonds blanch them, by steeping them in very hot water, which causes their epidermis to swell, and separate easily. After they peel them, they dry them in a stove, then grind them in a mill like a coffee-mill, and lastly, express the oil from the paste inclosed in a hempen bag. By blanching the almonds, the paste which remains

within the bag is sold with greater advantage to the perfumers, and the oil obtained is perfectly colourless. But the heat employed disposes the oil to become rancid, and the colour the oil acquires from the epidermis does not injure its qualities. For pharmaceutical use, therefore, the oil should not be expressed from blanched almonds, but merely rubbed in a piece of coarse linen, to separate the brown powder adhering to the epidermis, as much as possible. Sixteen ounces of sweet almonds commonly give five ounces and a half of oil. Bitter almonds afford the same proportions, but the oil has a pleasant bitter taste. See the article *OILS*.

In this manner are to be expressed,

Oleum amygdalæ, almond oil, from the kernel.

Oleum lini, linseed oil, from the bruised seeds.

Oleum ricini, castor oil, from the seeds previously decorticated.

Oleum sinapis, oil of mustard, from the bruised seeds.

CLASS VII.—*Aque distillate*. Distilled waters.

Substances which differ in volatility may be separated from each other by applying a degree of heat capable of converting the most volatile into vapour, and by again condensing this vapour in a proper apparatus. Water is converted into vapour at 212° , and may be separated by distillation from the earthy and saline matters which it always contains in a natural state. But it is evident, that if any substances which are as volatile as water be exposed to the same degree of heat, either by immersing them in boiling water, or exposing them to the action of its steam, they will rise with it in distillation. In this way the camphor and volatile oils of vegetable substances are separated from the more fixed principles; and as water is capable of dissolving a certain quantity of these volatile substances, it may be impregnated with a great variety of flavours by distilling it from different aromatic substances. If the subject of our distillation contain more volatile oil than the water employed is capable of dissolving, it will render the water milky, and afterwards separate from it. It is in this way that essential oils are obtained.

Essential oils are obtained only from odoriferous substances; but not equally from all of this class, nor in quantity proportional to their degree of odour. Some, which, if we were to reason from analogy, should seem very well fitted for this process, yield extremely little oil, and others none at all. Roses and chamomile flowers, whose strong and lasting smell promises abundance, are found to contain but a small quantity of oil: the violet and jessamine flower, which perfume the air with their odour, lose their smell upon the gentlest coction, and do not afford any oil, on being distilled, unless immense quantities are submitted to the operation at once; while savin, whose disagreeable scent extends to no great distance, gives out the largest proportion of oil of almost any vegetable known.

Nor are the same plants equally fit for this operation, when produced in different soils or seasons, or at different times of their growth. Some yield more oil if gathered when the flowers begin to fall off than at any other time. Of this we have examples in lavender and rue; others, as sage, afford the largest quantity when young, before they have sent forth any flowers; and others, as thyme, when the flowers have just ap-

peared. All fragrant herbs yield a larger proportion of oil, when produced in dry soils and in warm summers, than in opposite circumstances. On the other hand, some of the disagreeable strong-scented ones, as wormwood, are said to contain most oil in rainy seasons, and when growing in moist rich grounds.

Several chemists have been of opinion, that herbs and flowers, moderately dried, yield a greater quantity of essential oil than if they were distilled when fresh. It is, however, highly improbable, that the quantity of essential oil will be increased by drying; on the contrary, part of it must be dissipated and lost. But drying may sometimes be useful in other ways; either by diminishing the bulk of the subject to be distilled, or by causing it to part with its oil more easily.

The choice of proper instruments is of great consequence for the performance of this process to advantage. There are some oils which pass freely over the swan-neck of the head of the common still: others, less volatile, cannot easily be made to rise so high. For obtaining these last, we would recommend a large low head, having a rim or hollow canal round it: in this canal, the oil is detained in its first ascent, and thence conveyed at once into the receiver, the advantages of which are sufficiently obvious.

With regard to the proportion of water to be employed; if whole plants, moderately dried, are used, or the shavings of woods, as much of either may be put into the vessel as, lightly pressed, will occupy half its cavity; and as much water may be added as will fill two thirds of it. When fresh and juicy herbs are to be distilled, thrice their weight of water will be fully sufficient; but dry ones require a much larger quantity. In general, there should be so much water, that after all intended to be distilled has come over, there may be liquor enough left to prevent the matter from burning to the still. The water and ingredients, altogether, should never take up more than three fourths of the still; there should be liquor enough to prevent any danger of an empyreuma, but not so much as to be apt to boil over into the receiver.

The subject of distillation should be macerated in the water until it be perfectly penetrated by it. To promote this effect, woods should be thinly shaved across the grain, or sawn, roots cut transversely into thin slices, barks reduced into coarse powder, and seeds slightly bruised. Very compact and tenacious substances require the maceration to be continued a week or two, or longer; for those of a softer and looser texture, two or three days are sufficient; while some tender herbs and flowers not only stand in no need of maceration, but are even injured by it. The fermentation which was formerly prescribed in some instances, is always hurtful.

With regard to the fire, the operator ought to be expeditious in raising it at first, and to keep it up during the whole process, to such a degree only, that the oil may freely distil; otherwise the oil will be exposed to an unnecessary heat; a circumstance which ought as much as possible to be avoided. Fire communicates to all these oils a disagreeable impregnation, as is evident from their being much less grateful when newly distilled, than after they have stood for some time in a cool place: and the longer the heat is continued, the greater alteration it produces in them.

The greater number of oils require for their dis-

P H A R M A C Y.

distillation the heat of water strongly boiling: but there are many also which rise with a heat considerably less; such as those of lemon and citron peel; of the flowers of lavender and rosemary, and of almost all the more odoriferous kinds of flowers. We have already observed, that these flowers have their fragrance much injured, or even destroyed, by beating or bruising them; it is impaired also by the immersion in water in the present process, and the more so in proportion to the continuance of the immersion and the heat; hence oils, distilled in the common manner, prove much less agreeable in smell than the subjects themselves. For the distillation of substances of this class, another method has been contrived; instead of being immersed in water, they are exposed only to its vapour. A proper quantity of water being put into the bottom of the still, the odoriferous herbs or flowers are laid lightly in a basket, of such a size that it may enter into the still, and rest against its sides, just above the water. The head being then fitted on, and the water made to boil, the steam, percolating through the subject, imbibes the oil, without impairing its fragrance, and carries it over into the receiver. Oils thus obtained possess the odour of the subject in an exquisite degree, and have nothing of the disagreeable scent perceivable in those distilled by boiling them in water in the common manner.

Plants differ so much, according to the soil and season of which they are the produce, and likewise according to their own ages, that it is impossible to fix the quantity of water to be drawn from a certain weight of them to any invariable standard. The distillation may always be continued as long as the liquor runs well flavoured off the subject, but no longer.

In the distillation of essential oils, the water, as was observed in a foregoing section, imbibes always a part of the oil. The distilled liquors here treated of are no other than water thus impregnated with the essential oil of the subject; whatever smell, taste, or virtue, is communicated to the water, or obtained in the form of watery liquor, being found in a concentrated state in the oil.

All those vegetables, therefore, which contain an essential oil, will give over some virtue to water by distillation: but the degree of the impregnation of the water, or the quantity of water which the plant is capable of saturating with its virtue, are by no means in proportion to the quantity of its oil. The oil saturates only the water that comes over at the same time with it: if there be more oil than is sufficient for this saturation, the surplus separates, and concretes in its proper form, not miscible with the water that arises afterwards. Some odoriferous flowers, whose oil is in so small quantity that scarcely any visible mark of it appears, unless fifty or an hundred pounds or more are distilled at once, give nevertheless as strong an impregnation to water as those plants which abound most with oil.

Many have been of opinion, that distilled waters may be more and more impregnated with the virtues of the subject, and their strength increased to any assigned degree, by cohobation, that is, by re-distilling them repeatedly from fresh parcels of the plant; experience, however, shews the contrary. A water, skillfully drawn in the first distillation, proves, on every repeated one, not stronger, but more disagreeable.

Aqueous liquors are not capable of imbibing above a certain quantity of the volatile oil of vegetables; and this they may be made to take up by one, as well as by any number of distillations: the oftener the process is repeated, the ungrateful impression which they generally receive from the fire, even at the first time, becomes greater and greater.

Those plants which do not yield at first waters sufficiently strong, are not proper subjects for this process.

The mixture of water and oil which comes over, may either be separated immediately, by means of a separatory, or after it has been put into large narrow-necked bottles, and placed in a cool place, that the portion of oil which is not dissolved in the water may rise to the top, or sink to the bottom, according to its specific gravity. It is then to be separated, either by a separatory, or by means of a small glass syringe; or by means of a filter of paper; or, lastly, by means of a woollen thread, one end of which is immersed in the oil, and the other lower end in a phial: the oil will thus pass over into the phial by capillary attraction, and the thread is to be squeezed dry.

Most distilled waters, when first prepared, have a somewhat unpleasant smell, which, however, they gradually lose: it is therefore advisable to keep them for some days after their preparation in vessels but slightly covered; and not to cork them up until they lose that smell.

That the waters may keep the better, about one-twentieth part of their weight of proof spirit may be added to each after they are distilled. I have been informed by a respectable apothecary, that if the simple distilled waters be rectified by distilling them a second time, they will keep for several years without the addition of any spirit, which always gives an unpleasant flavour, and is often objectionable for other reasons.

Distilled waters are employed chiefly as grateful diluents, as suitable vehicles for medicines of greater efficacy, or for rendering disgusting ones more acceptable to the palate and stomach: few are depended on, with any intention of consequence by themselves.

To the chapter on simple distilled waters, the London college annexed the following remarks in the old pharmacopoeia.

“We have ordered most of the waters to be distilled from the dried herbs, because fresh are not ready at all times of the year. Whenever the fresh are used, the weights are to be increased. But, whether the fresh or dried herbs be employed, the operator may vary the weight according to the season in which they have been produced and collected.” The same directions, with but little alteration, are contained in the new.

Herbs and seeds kept beyond the space of a year become less proper for the distillation of waters.

To every gallon of these waters add five ounces, by measure, of proof spirit.

The Edinburgh college order half an ounce of proof spirit to every pound of the water, which is nearly the same.

But the Dublin college order five ounces of proof spirit to be added to each pound, which is probably a typographical error.

Water itself is ordered to be distilled, to give it greater purity; and the substances from which

PHARMACY.

distilled waters are to be drawn, are as follows: the weight of each being sufficient for a gallon.

Two pounds of fresh orange-peel, Edin.

Aqua citri aurantii.

One pound of sweet fennel-seeds bruised, Lond. Dubl.

Aqua fœniculi dulcis.

Six pounds of the recent petals of the damask rose, the London Pharmacopœia directs eight pounds,

Aqua rosæ centifoliæ, Edin.

Aqua rosæ, Lond. Dub.

Three pounds, Edin. one pound and a half, Lond. Dubl. of peppermint.

Aqua menthæ piperitæ, Edin.

Aqua menthæ piperitidis, Lond. Dub.

Three pounds, Edin. one pound and a half, Lond. Dubl. of pennyroyal, in flower,

Aqua menthæ pulegii, Edin.

Aqua pulegii, Lond. Dubl.

Two pounds of fresh lemon-peel,

Aqua citri medicæ, Edin.

One pound and a half of spearmint,

Aqua menthæ sativæ, Dubl. Lond.

One pound of cinnamon, (macerated for a day) Lond. Dubl.

Aqua lauri cinnamoni, Edin.

Aqua cinnamoni, Lond. Dubl.

One pound of cassia,

Aqua lauri cassiæ, Edin.

One pound of bruised dill seeds,

Aqua anethi, Lond.

Half a pound of pimento, (macerated for a day), Lond.

Aqua myrti pimentæ, Edin.

Aqua pimento, Lond.

The virtues of all these waters are nearly alike; and the peculiarities of each will be easily understood by consulting the account given in the *materia medica*, of the substance from which they are prepared. Mr. Nicholson mentions, that as rose-water is exceedingly apt to spoil, the apothecaries generally prepare it in small quantities at a time from the leaves, preserved by packing them closely in cans with common salt. This we understand is not the practice in Edinburgh, and indeed cannot succeed with the petals of the damask rose, for they lose their smell by drying. The London apothecaries, therefore, probably use the red rose. The spoiling of some waters is owing to some mucilage carried over in the distillation; for, if rectified by a second distillation, they keep perfectly.

CLASS VIII.—*Olea volatilika. Volatile oils.*

These are prepared nearly in the same manner as distilled waters, except that less water is to be added.

Seeds, and woody substances, are to be previously bruised, or rasped. The oil comes over with the water, and is afterwards to be separated from it, according as it may be lighter than the water, and swim upon its surface, or heavier, and sink to the bottom.

Besides, in preparing distilled waters and oils, it is to be observed, that the goodness of the subject, its texture, the season of the year, and similar causes must give rise to so many differences, that no certain or general rule can be given to suit accurately each example. Hence, the following is the mode prescribed by the London college.

The seeds of anise and caraway, the flowers of chamomile and lavender, the berries of juniper and allspice, and the tops of rosemary; and in the remaining instances the whole plants dried are to be employed. Introduce any of these substances into an alembic, and pour on as much water as will cover it; then distil the oil into a large refrigerator.

According to these directions are prepared the volatile, distilled, or essential oils; or *olea volatilika*, Edin. *distilla*, Dub. *vel essentialia*, Lond.

Anise, *pimpinellæ anisi*, Edin. *anisi*, Lond. Dub. *chamomile anthemidis*, Lond.

Caraway, *carui*, Lond. Dub.

Fennel seeds, *seminum fœniculi dulcis*, Dub. from the seeds.

Juniper berries, *juniperi communis*, Edin. *baccarum juniperi*, Dub. *juniperi baccae*, Lond. from the berries.

Pimento, *myrti pimentæ*, Edin. from the fruit.

Fennel flowers, *florum fœniculi dulcis*, Dub.

Rosemary, *rosmarinum officinalis*, Edin. *rosmarini*, Lond. Dub.

Lavender, *lavendulæ spicæ*, Edin. *lavandulæ*, Lond.

Peppermint, *menthæ piperitæ*, Edin. Lond. Dub.

Spearmint, *menthæ sativæ*, m. *viridis*, Lond. Dub.

Pennyroyal, *pulegii*, Lond. Dub.

Origano, *origani*, Lond. Dub.

Rue, *rutæ*, Dub.

Savine, *juniperi sabinæ*, Edin. *sabinæ*, Dub. from the flower, or herb in flower.

Sassafras, *lauri sassafras*, Edin.

And, turpentine, *pinus picea*, from the resin.

The residuum, after the oil has been extracted, is the official resin (*resina flava*): and a rectified spirit is obtained by distilling the oil of turpentine with four times its weight of water.

The spirit of turpentine, as this essential oil has been styled, is frequently taken internally as a diuretic and sudorific; and it has sometimes a considerable effect when taken to the extent of a few drops only. It has, however, been given in much larger doses, especially when mixed with honey. Recourse has principally been had to such doses in cases of chronic rheumatism, particularly in those modifications of it which are termed sciatica and lumbago; but sometimes it induces bloody urine.

The water employed in the distillation of volatile oils always imbibes some portion of the oil; as is evident from the smell, taste, and colour, which it acquires. It cannot, however, retain above a certain quantity; and therefore, such as has been already used and almost saturated itself, may be advantageously employed, instead of common water, in a second, third, or any future distillation of the same subject.

After the distillation of one oil, particular care should be had to clean the worm perfectly before it be employed in the distillation of a different substance. Some oils, those of wormwood and aniseeds for instance, adhere to it so tenaciously, as not to be melted out by heat, or washed off by water; the best way of removing these is to run a little spirit of wine through it.

Volatile oils, after they are distilled, should be suffered to stand for some days, in vessels loosely covered with paper, till they have lost their disagreeable fiery odour, and become limpid; then put them up in small bottles, which are to be

PHARMACY.

kept quite full, closely stopped, in a cool place. With these cautions, they will retain their virtues in perfection for many years.

Most of the oils mentioned above are prepared by our chemists in Britain, and are easily procurable in a tolerable degree of perfection; but the oils from the more expensive spices, though still introduced among the preparations in the foreign pharmacopœias, are, when employed among us, usually imported from abroad.

These are frequently so much adulterated that it is not easy to meet with such as are at all fit for use. Nor are these adulterations easily discoverable. The grosser abuses, indeed, may be readily detected. Thus, if the oil be mixed with spirit of wine it will turn milky on the addition of water; if with expressed oils, rectified spirit will dissolve the volatile, and leave the other behind; if with oil of turpentine, on dipping a piece of paper in the mixture, and drying it with a gentle heat, the turpentine will be betrayed by its smell. But the more subtle artists have contrived other methods of sophistication, which elude all trials of this kind.

Some have looked upon the specific gravity of oils as a certain criterion of their genuineness. This, however, is not to be absolutely depended on; for the genuine oils, obtained from the same subjects, often differ in gravity as much as those drawn from different ones. Cinnamon and cloves, whose oils usually sink in water, yield, if slowly and warily distilled, oils of great fragranc, which are nevertheless specifically lighter than the aqueous fluid employed in their distillation; whilst on the other hand, the last runnings of some of the lighter oils prove sometimes so ponderous as to sink in water.

As all volatile oils agree in the general properties of solubility in spirit of wine, indissolubility in water, miscibility with water by the intervention of certain intermedia, volatility in the heat of boiling water, &c. it is plain that they may be variously mixed with each other, or the dearer sophisticated with the cheaper, without any possibility of discovering the abuse by any trials of this kind. And, indeed, it would not be of much advantage to the purchaser, if he had infallible criteria of the genuineness of every individual oil. It is of as much importance that they be good, as that they be genuine; for genuine oils, from inattentive distillation, and long and careless keeping, are often weaker doth in smell and taste than the common sophisticated ones.

The smell and taste seem to be the only certain tests of which the nature of the thing will admit. If a bark should have, in every respect, the appearance of good cinnamon, and should be proved indisputably to be the genuine bark of the cinnamon tree; yet if it want the cinnamon flavour, or has it but in a low degree, we reject it; and the case is the same with the oil. It is only from use and habit, or comparisons with specimens of known quality, that we can judge of the goodness either of the drugs themselves, or of their oils.

Most of the volatile oils indeed are too hot and pungent to be tasted with safety; and the smell of the subject is so much concentrated in them, that a small variation in this respect is not easily distinguished; but we can readily dilute them to any assignable degree. A drop of the oil may be dissolved in spirit of wine, or received on a bit of sugar, and dissolved by that intermedium in water. The quantity of liquor which it

thus impregnates with its flavour, or the degree of flavour which it communicates to a certain determinate quantity, will be the measure of the degree of goodness of the oil.

Medical use. Volatile oils, medicinally considered, agree in the general qualities of pungency and heat; in particular virtues they differ as much as the subjects from which they are obtained, the oil being the direct principle in which the virtues, or at least a considerable part of the virtues, of the several subjects reside. Thus the carminative virtue of the warm seeds, the diuretic of juniper berries, the emmenagogue of savin, the nervin of rosemary, the stomachic of mint, the antiscorbutic of scurvy-grass, the cordial of aromatics, &c. are supposed to be concentrated in their oils.

There is another remarkable difference in volatile oils, the foundation of which is less obvious, that of the degree of their pungency and heat. These are by no means in proportion, as might be expected, to those of the subject they were drawn from. The oil of cinnamon, for instance, is excessively pungent and fiery; in its undiluted state it is almost caustic: whereas cloves, a spice which in substance is far more pungent than the other, yields an oil which is far less so. This difference seems to depend partly upon the quantity of oil afforded, cinnamon yielding much less than cloves, and consequently having its active matter concentrated into a smaller volume; partly, upon a difference in the nature of the active parts themselves: for though volatile oils contain always the specific odour and flavour of their subjects, whether grateful or ungrateful, they do not always contain the whole pungency: this resides frequently in a more fixed matter, and does not rise with the oil. After the distillation of cloves, pepper, and some other spices, a part of their pungency is found to remain behind: a simple tincture of them in rectified spirit of wine is even more pungent than their pure essential oils.

The more grateful oils are frequently made use of for reconciling to the stomach medicines of themselves disgusting. It has been customary to employ them as correctors for the resinous purgatives; an use which they do not seem to be well adapted to. All the service they can here be of is to make the resin sit more easily at first on the stomach: far from abating the irritating quality upon which the violence of its operation depends, these pungent oils superadd a fresh stimulus.

Volatile oils are never given alone, on account of their extreme heat and pungency; which in some is so great, that a single drop let fall upon the tongue produces a gangrenous eschar. They are readily imbibed by pure dry sugar, and in this form may be conveniently exhibited. Ground with eight or ten times their weight of sugar they become soluble in aqueous liquors, and thus may be diluted to any assigned degree. Mucilages also render them miscible with water into an uniform milky liquor. They dissolve likewise in spirit of wine; the more fragrant in an equal weight, and almost all of them in less than four times their own quantity. These solutions may be either taken on sugar, or mixed with syrups, or the like. On mixing them with water the liquor grows milky, and the oil separates.

The more pungent oils are employed externally against paralytic complaints, numbness, pains, and aches, cold tumours, and in other cases where particular parts require to be heated or stimu-

PHARMACY.

lated. The tooth-ach is sometimes relieved by a drop of these almost caustic oils, received on cotton, and cautiously introduced into the hollow tooth.

Among the volatile oils ought also to be enumerated the empyreumatic oils; for these also are volatile, but have a character peculiar to themselves. The simple volatile oils exist ready formed in the aromatic substances from which they are obtained, and are only separated from the fixed principles by the action of a heat not exceeding that of boiling water. The empyreumatic, on the contrary, are always formed by the action of a degree of heat considerably higher than that of boiling water, and are the product of decomposition, and a new arrangement of the elementary principles of substances, containing at least oxygen, hydrogen, and carbon. Their production is therefore always attended with the formation of other new products. In their chemical properties they do not differ very remarkably from the volatile oils, and are principally distinguished from them by their unpleasant, pungent smell, and rough, bitterish taste. The following are the chief:

Oleum petrolei, oil of bitumen, or tar.

Oleum succini, oil of amber, which is afterwards rectified.

Oleum animale, animal oil, obtained from harts-horn, which also is rectified by being again distilled with water.

CLASS IX. *Spiritus distillati. Distilled spirits.*

The flavour and virtues of distilled waters are owing, as observed in the preceding chapter, to their being impregnated with a portion of the essential oil of the subject from which they are drawn. Alcohol, considered as a vehicle for these oils, has this advantage above water, that it keeps all the oil that rises with it perfectly dissolved into an uniform limpid liquor.

Nevertheless, many substances, which, on being distilled with water, impart to it their virtues in great perfection; if treated in the same manner with alcohol, scarcely give over to it any smell or taste. The cause of this difference is, that alcohol is not susceptible of so great a degree of heat as water. It is obvious, therefore, that substances may be volatile enough to rise with the heat of boiling water, but not with that of boiling alcohol.

Thus if cinnamon, for instance, be committed to distillation with a mixture of alcohol and water, or with a pure proof spirit, which is no other than a mixture of about equal parts of the two; the alcohol will arise first clear, colourless, and transparent, and almost without any taste of the spice: but as soon as the more ponderous watery fluid begins to arise, the oil comes freely over with it, so as to render the liquor highly odorous, sapid, and of a milky hue.

The proof spirits usually met with in the shops are accompanied with a degree of ill flavour, which, though concealed by means of certain additions, plainly discovers itself in distillation. This nauseous flavour does not begin to arise till after the purer spiritous part has come over, which is the very time that the virtues of the ingredients begin also to arise most plentifully; and hence the liquor receives an ungrateful taint. To this cause principally is owing the general complaint, that the cordials of the apothecary are less agreeable than those of the same kind prepared by the distiller; the latter being extremely curious in recti-

fying or purifying the spirits (when designed for what he calls fine goods) from all unpleasant flavour.

Spiritus cari carvi, Edin. spirit of caraway. Take of caraway seeds half a pound; diluted alcohol nine pounds. Macerate two days in a close vessel; then pour on as much water as will prevent empyreuma, and draw off by distillation nine pounds.

Spiritus carui, Lond. Dub. spirit of caraway. Take of caraway seeds, bruised, half a pound; proof spirit of wine one gallon; (nine pounds, Dub.) water sufficient to prevent empyreuma. Draw off one gallon, (nine pounds, Dub.)

In the same manner is prepared the same quantity of spirit from

Cinnamon, one pound,

Spiritus lauri cinnamomi, Edin.

Spiritus cinnamomi, Lond. Dub.

Peppermint, one pound and a half,

Spiritus menthæ piperitæ, Edin. Lond.

Spearmint, one pound and a half,

Spiritus menthæ viridis, Lond.

Pennyroyal dried, a pound and a half,

Spiritus pulegii, Lond.

Nutmeg, well bruised, two ounces,

Spiritus myristicæ (moschatæ,) Edinburgh. London.

Spiritus nucis moschatæ, Dub.

Pimento, half a pound,

Spiritus myrti pimentæ, Edin.

Spiritus pimentæ, Dub. Lond.

The rest belonging to this division are obtained from

Lavender,

Spiritus lavandulæ, Lond.

Spiritus lav. spicæ, Edin.

Rosemary,

Spiritus rosmarini, Lond. Edin.

Anise, &c.

Spiritus anisi compositus, Lond.

Juniper, &c.

Spiritus juniperi compositus, Lond. Edin. Dub.

Horse-radish, &c.

Spiritus raphani compositus, Dub.

Armoracia comp. Lond.

Assafoetida,

Spiritus ammoniæ fetidus, Lond.

CLASS X. *Decocta. Decoctions.*

Decoctions and infusions differ chiefly in the employment of boiling or of cold water. At the same time, however, that the increase of temperature in decoctions facilitates and expedites the solution of some fixed principles, it gives others a tendency to decomposition, and dissipates all volatile matters. Decoction, therefore, can only be used with advantage for the extraction of principles which are neither volatilized nor altered by a boiling heat.

To promote the action of the menstruum, infusion is sometimes premised to decoction.

In compound decoctions it is sometimes convenient not to put in all the ingredients from the first, but in succession, according to their hardness, and the difficulty with which their virtues are extracted; and if any aromatic, or other substances, containing volatile principles, enter into the composition, the boiling decoction is to be simply poured upon them, and covered up until it cool.

Decoctions should be made in vessels sufficient-

PHARMACY.

ly large to prevent any risk of boiling over, and should be continued without interruption, and gently.

The official preparations under this class are,
Decoctum aloes compositum, Lond.

Decoctum althææ officinalis, Edin. decoction of marshmallows.

Decoctum anthemidis nobilis, Edin. decoction of chamomile flowers.

Decoctum cinchonæ, Lond. Edin. decoction of Peruvian bark.

Decoctum daphnes mezerei, Edin. decoction of mezereon.

Decoctum geoffrææ inermis, Edin. decoction of cabbage-tree bark.

Decoctum guaiaci officinalis comp. Edin. decoction of the woods.

Decoctum hordei, Lond. hord. distichi, Edin. decoction of barley.

Decoctum polygalæ senegæ, Edin. decoction of seneka.

Decoctum sarsaparillæ, Lond. Dubl. decoctum smilacis sarsaparillæ, Edin. decoction of sarsaparilla.

Decoctum smilacis sarsaparillæ, Edin. decoctum smilacis sarsaparilla, comp. Dubl. Lond. decoction of compound of the same.

Decoctum ulmi, Lond. decoction of elm.

Decoctum cydoniæ, Lond. decoction of quince.

Decoctum dulcamaræ, Lond. decoction of woody night-shade.

Decoctum lichenis, Lond. decoction of liverwort.

Decoctum malvæ comp. Lond. decoction of mallow, compound.

Decoctum papaveris, Lond. decoction of poppy.

Decoctum quercus, Lond. decoction of oak-bark.

CLASS XI. *Infusa. Infusions.*

We have already explained the sense in which we employ the term infusion. We confine it to the action of a menstruum, not assisted by ebullition, or any substance consisting of heterogeneous principles, some of which are soluble, and others insoluble, in that menstruum. The term is generally used in a more extensive, but, we are inclined to think, a less correct sense. Thus, lime water and the mucilages, which are commonly classed with the infusions, are instances of simple solution, and the chalk mixture is the mechanical suspension of an insoluble substance. When the menstruum used is water, the solution is termed simply an infusion; but when the menstruum is alcohol, and upon a colouring material, it is called a tincture; when wine or vinegar, a medicated wine or vinegar. Infusions in water are extremely apt to spoil, and are generally extempore preparations.

The following are those officially prescribed:

Infusum cinchonæ, Edin. infusion of Peruvian bark.

Infusum digitalis purpureæ, Edin. infusion of fox-glove.

Infusum gentianæ compositum, Lond. infusum gentianæ luteæ comp. Edin. infusion of gentian, compound.

Infusum mimosæ catechu, Edin. infusion of catechu.

Infusum rei palmati, Edin. infusion of rhubarb, Lond.

Infusum rosæ, Lond. infusum rosæ Gallicæ, Edin. infusion of roses.

Infusum sennæ, Lond. Dubl. infusion of senna.

Infusum tamarindi Ind. cum cassia senna, Edin. infusion of tamarinds and senna.

To these, which have been long in use, the London College has now added infusions of chamomile, horse-radish, orange-peel, calumba, cloves, cascarrilla, cusparia (angustura) and linseed.

CLASS XII. *Mucilagines. Mucilages.*

These, as officially prescribed, are as follow:

Mucilago amyli, Lond. Edin. mucilage of starch, obtained by boiling.

Mucilago tragacanthæ, Lond. mucilago astragalitragac. Edin. mucilago gummi tragac. Dubl. mucilage of tragacanth, obtained by trituration with boiling water.

Mucilago mimosæ niloticæ, Edin. mucilago acaciæ, Lond. mucilage of gum arabic, obtained as the preceding.

CLASS XIII. *Syrupi. Sytups.*

In making these, the following is the proportion where no particulars are mentioned in respect to the weight of sugar.

Take of double-refined sugar twenty-nine ounces; any kind of liquor one pint, (one pint and a half, Dubl.); dissolve the sugar in the liquor, in a water bath; (mix and boil down to one pound, Dubl.); then set it aside for twenty-four hours; take off the scum, and pour off the syrup from the feces if there be any.

Syrups are solutions of sugar in any watery fluid, whether simple or medicated. Simple syrup is nutritious and demulcent. When made of fine sugar, it is transparent and colourless. If necessary, it is easily clarified by beating to a froth the white of an egg with three or four ounces of water, mixing it with the syrup, and boiling the mixture for a few seconds, until the albumen coagulates, and enveloping all heterogeneous matters, it forms a scum, which may be easily taken off, or separated by filtration. When, instead of simple water, any other fluid is used for dissolving the sugar, the syrup is then medicated. Medicated syrups are prepared either with express juices, infusions, decoctions, or saline fluids. The object of forming these into syrups, is either to render them agreeable to the palate, or to preserve them from fermentation. In the latter case, the quantity of sugar added becomes a matter of great importance; for if too much be employed the sugar will separate by crystallization; and if too little, instead of preventing fermentation, it will accelerate it. About two parts of sugar to one of fluid are the proportions directed by the British Colleges with this view. But as, in some instances, a larger quantity of fluid is added, and afterwards reduced to the proper quantity by decoction, it will not be superfluous to point out some circumstances which show the evaporation to have been carried far enough. These are the tendency to form a pellicle on its surface, when a drop of it is allowed to cool, the receding of the last portion of each drop, when poured out drop by drop, after it is cold; and, what is most to be relied on, its specific gravity when boiling hot being about 1.385, or 1.3 when cold. The syrup which remains, after all the crystallizable sugar has been separated from it, has been much, and probably justly, recommended by some for the preparation of medicated syrups and electuaries, although its pharmaceutical superiority is actually owing to its impurity.

The following are the official preparations.

PHARMACY.

Syrupus simplex, Edin. simple syrup.
Syrupus acidi acetosi, Edin. syrup of acetous acid.

Syrupus allii, Dubl. syrup of garlic.
Syrupus althææ, Lond. Edin. syrup of marsh-mallows.

Syrupus zingiberis, Lon. syrupus amomi zing. Edin. syrup of ginger.

Syrupus aurantii, Lond. syrupus citri aurantii, Edin. syrup of orange-peel.

Syrupus limonis, Lond. Dubl. syrupus citri medici, Edin. syrup of lemons.

Syrupus succi fructus mori, Dubl. Lond. syrup of mulberries.

Syrupus colchici autumnalis, Edin. syrup of colchicum.

Syrupus dianthi caryophylli, Edin. syrup of cloves; July flowers.

Syrupus croci, Lond. syrup of saffron.

Syrupus mannæ, Dubl. syrup of manna.

Syrupus papaveris somniferi, Edin. syrupus papaveris, Lond. syrup of white poppies.

Syrupus rhæados, Lond. syrup of red poppies.

Syrupus opii, Dubl. syrup of opium.

Syrupus rhamni cathartici, Edin. rhamni, Lond. syrup of buckthorn.

Syrupus rosæ, Lond. syrupus rosæ centifoliæ, Edin. syrup of damask roses.

Syrupus rosæ Gallicia, Edin. syrup of roses.

Syrupus scillæ maritimæ, Edin. syrup of squills.

Syrupus sennæ, Lond. syrup of senna.

Syrupus toluanus, Lond. syrupus toluiferæ balsami, Edin. syrup of balsam of tolu.

Syrupus violæ odoratæ, Edin. syrup of violets.

CLASS XIV.—*Mellita. Medicated honeys.*

Honey itself is first to be despumated or clarified by dissolving it in a water-bath, and removing the scum as it arises. The following preparations are then made of it.

Mel. Lond. honey, boracis of borax.

Mel. rosæ, Lond. Dubl. honey of roses.

Mel. scillæ, Lond. honey of squills.

Oxymel scillæ, Lond. oxymel of squills.

CLASS XV.—*Misturæ et emulsiones. Mixtures and emulsions.*

This double class comprehends preparations in which oils and other substances, insoluble in water, are mixed with, and suspended in, watery fluids, by means of such viscid substances as mucilages and syrups. In the new London Pharmacopœia, the word emulsion is altogether omitted, and the articles are referred to the division of mixtures.

Emulsio amygdalæ communis, Edin. mist. amygdalæ, Lond. almond emulsion.

Emulsio arabica, Edin. Dubl. gum arabic emulsion.

Emulsio camphorata, Edin. mistura camphoræ, Lond. camphorated emulsion or mixture.

Mistura ammoniaci, Lond. lac ammonia, Dubl. emulsion of gum ammoniac.

Mistura asæ fetidæ, Lond. lac asafœtida, emulsion of asafœtida.

Mistura moschi, Lond. musk mixture.

Mistura crétæ, Lond. chalk mixture.

CLASS XVI.—*Aceta. Medicated vinegars.*

Infusions of vegetable substances in acetic acid are commonly called medicated vinegars. The action of the acid in this case may be considered as twofold.

1. It acts simply as water, in consequence of

the great quantity of water which enters into its composition, and generally extracts every thing which water is capable of extracting.

2. It exerts its own peculiar action as an acid. In consequence of this it sometimes increases the solvent power of its watery portion, or dissolves substances which water alone is incapable of dissolving, and in a few instances it impedes the solution of substances which water alone would dissolve.

As acetic acid, in itself sufficiently perishable, has its tendency to decomposition commonly increased by the solution of any vegetable matter in it, it should never be used as a menstruum, unless where it promotes the solution of the solvent, as in extracting the acrid principle of squills, colchicum, &c. and in dissolving the volatile, and especially the empyreumatic oils, or where it coincides with the virtues of the solvent.

Acetum aromaticum, Edin. aromatic vinegar, thieves vinegar.

Acetum colchici, Dub. Lond. vinegar of meadow saffron.

Acetum scillæ, Lond. acetum scillæ maritimæ, Edin. vinegar of squills.

Acidum acetosum camphoratum, Edin. camphorated acetous acid.

CLASS XVII.—*Tincturæ. Tinctures.*

The term tincture has often been employed in a very vague sense. It is now commonly applied to coloured solutions, made by digestion, in alcohol, or diluted alcohol. But it is also, though perhaps incorrectly, extended to solutions in ether, ethereal spirits, and spirit of ammonia.

Alcohol is capable of dissolving resins, gum resins, extractive, tannin, sugar, volatile oils, soaps, camphor, adipocere, colouring matters, acids, alkalies, and some compound salts. Many of these, as the gum resins, soaps, extractive, tannin, sugar, and saline substances, are also soluble in water, while water is capable of dissolving substances, such as gum, gelatine, and most of the compound salts, which are insoluble in alcohol. But the insolubility of these substances in the different menstrua is not absolute, but merely relative; for a certain proportion of alcohol may be added to a solution of gum in water without decomposing it; and a solution of resin in alcohol will bear a certain admixture of water without becoming turbid. Therefore, diluted alcohol, which is a mixture of these two menstrua, sometimes extracts the virtues of heterogeneous compounds more completely than either of them separately.

Alcohol is used as a menstruum.

1. When the solvent is not soluble, or sparingly soluble, in water.

2. When a watery solution of the solvent is extremely perishable.

3. When the use of alcohol is indicated as well as that of the solvent.

In making alcoholic tinctures, we must observe, that the virtues of recent vegetable matters are very imperfectly extracted by spirituous menstrua. They must therefore be previously carefully dried, and as we cannot assist the solution by means of heat, we must facilitate it by reducing the solvent to a state of as minute mechanical division as possible. To prevent loss, the solution is commonly made in a close vessel, and the heat applied must be very gentle, lest it be broken by the expansion of vapour.

The action of tinctures on the living system is always compounded of the action of the men-

P H A R M A C Y.

strum, and of the matters dissolved in it. Now, these actions may either coincide with, or oppose, each other; and as alcohol is at all times a powerful agent, it is evident that no substance should be exhibited in the form of a tincture, whose action is different from that of alcohol, unless it be capable of operating in so small a dose, that the quantity of alcohol taken along with it is inconsiderable.

Tinctures are not liable to spoil, as it is called, but they must nevertheless be kept in well closed phials, especially when they contain active ingredients, to prevent the evaporation of the menstruum.

They generally operate in doses so small, that they are rarely exhibited by themselves, but commonly combined with some vehicle. In choosing the latter, we must select some substance which does not decompose the tincture, or at least separates nothing from it in a palpable form.

The London college direct all tinctures, except that of muriat of iron, to be prepared in closed phials.

The Dublin college explain, that, when they order substances to be digested, they mean it be done with a low degree of heat; and when they are to be macerated, it is to be done with a degree of heat between 60° and 90°.

Tinctura aloes, Lond. *tinctura succotorinæ*, Edin. tincture of aloes.

Tinctura aloes composita, Lond. *tinctura aloes cum myrrha*, Edin. tincture of aloes with myrrh.

Tinctura cardamomi, Lond. *tinctura amomi repetitis*, Edin. tincture of cardamoms.

Tinctura serpentariæ, Lond. *tinctura aristolochiæ serpentariæ*, Edin. tincture of snake-root.

Tinctura assæ fetidæ, Lond. *tinctura of asafoetida*.

Tinctura aurantii corticis, Lond. *tinctura of orange-peel*.

Tinctura benzoini composita, Lond. *tinctura of benjamin*, compound.

Tinctura camphoræ, Edin. *spiritus camphoratus*, Lond. *tincture of camphor*, camphorated spirit.

In this the Edinburgh title is grossly inaccurate; the preparation being quite colourless instead of tintured.

Tinctura cascarillæ, Lond. *tinctura of cascarilla*.

Tinctura sennæ, Lond. *tincture of senna*.

Tinctura cassiæ sennæ composita, Edin. *tincture of senna compound*; elixir of health.

Tinctura castorei, Lond. *tincture of castor*.

Tinctura cinchonæ, Lond. *tincture of Peruvian bark*.

Tinctura cinchonæ composita, Lond. *tincture of Peruvian bark, compound*.

Tinctura calumbæ, Lond. *tincture of Columbo*.

Tinctura jalapæ, Lond. *tinctura convolvuli jalapæ*, Edin. *tincture of jalap*.

Tinctura croci, Edin. *tincture of saffron*.

Tinctura digitalis purpureæ, Edin. *tincture of foxglove*.

Tinctura gentianæ composita, Lond. *tincture of gentian, compound*.

Tinctura guaiaci, Edin. *tincture of guaiacum*.

Tinctura hellebori nigri, Lond. *tincture of black hellebore*.

Tinctura hyoscyami nigri, Edin. *tincture of henbane*.

Tinctura kino, Edin. *tincture of kino*.

Tinctura cinnamoni, Lond. *tinctura lauri cinnamomi*, Edin. *tincture of cinnamon*.

Tinctura lauri cinnamomi composita, Edin. *tincture of cinnamon, compound*.

Tinctura lavendula comp. *Dubl. spiritus lavendulæ comp.* *Lond. spiritus lavendulæ spicæ comp.* *Edin. tincture of lavender, and spirit of lavender*.

Here the Dublin title is wrong; the tincture is not derived from the lavender, but from the red saunders.

Tinctura cantharidis, *Dubl. tinctura meloes vesicatorii*, *Edin. tinctura lyttæ*, *Lond. tincture of cantharides*.

Tinctura misosæ catechu, *Edin. tincture of catechu*.

Tinctura moschi, *Dubl. tincture of musk*.

Tinctura myrrhæ, *Lond. Edin. tincture of myrrh*.

Tinctura opii, *Lond. Edin. tincture of opium*.

Tinctura opii camphorata, *Dubl. tincture of opium camphorated*.

Tinctura camphoræ composita, *Lond. compound tincture of camphor*. Here the Dublin title is right, and the London erroneous; the tincture is not produced from the camphor, but from the opium.

Tinctura rhabbari, *Dubl. tinctura rhei palmati*, *Edin. tincture of rhabarb*.

Tinctura rhei composita, *Lond. tincture of rhabarb, compound*.

Tinctura rhei cum aloe, *Edin. tincture of rhabarb with aloes*.

Tinctura rhei cum gentiana, *Edin. tincture of rhabarb with gentian*.

Tinctura saponis, *Edin. linimentum saponis compositum*, *Lond. linimentum saponaceum, tincture of opodeldoc*.

Tinctura saponis cum opio, *Edin. anodyne liniment*.

Tinctura scillæ, *Lond. tincture of squill*.

Tinctura bals. tolutani, *Dubl. tinctura toluiferæ balsamic*, *Edin. tincture of balsam of tolu*.

Tinctura valerianæ, *Lond. tincture of valerian*.

Tinctura ammoniata, *Lond.*

Tinctura veratri albi, *Edin. tincture of white hellebore*.

Tinctura zingiberis, *Lond. tincture of ginger*.

Tinctura humuli, *tincture of hop*, *Lond.*

Tinctura kino, *tincture of kino*, *Lond.*

CLASS XVIII.—*Ætherea. Etherial spirits.*

Alcohol, alcohol.

Æther sulphuricus, *Edin. æther vitriolicus*, *Lond. tincture of sulphuric ether, vitriolic ether*.

Æther sulphuricus cum alcohol, *Edin. spiritus ætheris vitriolici*, *Lond. spirit of ether*.

Spiritus ætheris vitriolici, *comp. Lond. Hoffman's anodyne liquor*.

Spiritus ætheris nitrosi, *Edin. spirit of nitrous ether*.

Linimentum camphoræ compositum, *Lond. compound camphor liniment*.

Linimentum volatile, *Dubl. volatile liniment*.

Alcohol ammoniatum aromaticum, *Edin. spiritus ammoniæ*, *Lond. sal volatile*.

Spiritus ammoniæ succinatus, *Lond. amber, spirit of ammonia, or eau de luce*.

Tinctura castorei composita, *Edin. compound tincture of castor*.

Tinctura guaiaci ammoniata, *Edin. tincture of guaiacum*.

PHARMACY.

Tinctura opii ammoniati, Edin. tincture of opium.

Tinctura valerianæ ammoniata, Lond. Dubl. tincture of valerian.

CLASS XIX.—*Vina. Medicated wines.*

M. Parmentier has occupied thirty-two pages of the *Annales de Chimie*, to prove that wine is an extremely bad menstruum for extracting the virtues of medicinal substances. His argument (for there is but one), is, that by the infusion of vegetable substances in wine, its natural tendency to decomposition is so much accelerated, that at the end of the process, instead of wine, we have only a liquor containing the elements of bad vinegar. As a solvent, diluted alcohol perfectly supersedes the use of wine; and if we wish to use wine to cover the taste, or to assist the operation of any medicine, M. Parmentier proposes, that a tincture of the substance should be extemporaneously mixed with wine as a vehicle.

Notwithstanding this argument appears to us to have great weight, we shall allow to the medicated wines, retained in the pharmacopœias, the characters they still generally possess.

Vinum aloes, Lond. vinum aloes succotorinæ, Edin. wine of aloes.

Vinum gentianæ compositum, Edin. wine of gentian, compound.

Vinum ipecacuanhæ, Lond. Dubl. wine of ipecacuan.

Vinum nicotianæ tabaci, Edin. wine of tobacco.

Vinum opii, Lond. wine of opium.

Vinum rhabarbari, Lond. vinum rhei palmati, Edin. wine of rhubarb.

The metallic wines have been noticed already.

CLASS XX.—*Extracta. Extracts.*

Extract, in pharmacy, has been long used in the true and general sense of the term, to express a substance extracted from bodies of all kinds, by the action of whatever menstruum, and reduced to spissitude by the evaporation of that menstruum. Of late, however, it has been employed in a different and more limited sense, as the name for a peculiar principle, which is often, indeed, contained in extracts, and which before had no proper appellation. It is in the former sense that we employ it here, and in which we wish it to be only used, while a new word should be invented as the name of the new substance. Till a better be proposed, we shall call it extractive.

Extracts are of various kinds, according to the nature of the substances from which they are obtained, and the menstruum employed; but they commonly consist of gum, sugar, extractive, tannin, gallic acid, or resin, or several of them mixed in various proportions. The menstrea most commonly employed are water and alcohol. The former is capable of extracting all the substances enumerated except the resin, and the latter all except the gum. Wine is also sometimes employed, but very improperly; for as a solvent it can only act as a mixture of alcohol and water, and the principles which it leaves behind on evaporation are rather injurious than of advantage to the extract.

Water is the menstruum most economically employed in making extracts, as it is capable of dissolving all the active principles except resin, and can have its solvent powers assisted by a considerable degree of heat.

Watery extracts are prepared by boiling the subject in water, and evaporating the strained decoction to a thick consistence.

It is indifferent, with regard to the medicine, whether the subject be used fresh or dry; since nothing that can be preserved in this process will be lost by drying. With regard to the facility of extraction, there is a very considerable difference; vegetables in general giving out their virtues more readily when moderately dried than when fresh.

Very compact dry substances should be reduced into exceedingly small parts, previous to the affusion of the menstruum.

The quantity of water ought to be no greater than is necessary for extracting the virtues of the subject. This point, however, is not very easily ascertained; for although some of the common principles of extracts be soluble in a very small proportion of water, there are others, such as the tannin, of which water can dissolve only a certain proportion, and cannot be made to take up more by any length of boiling, and we have no very good method of knowing when we have used a sufficient quantity of water; for vegetable substances will continue to colour deeply successive portions of water boiled with them, long after they are yielding nothing to it but colouring matter. Perhaps one of the best methods is to boil the subject in successive quantities of water, as long as the decoctions form a considerable precipitate with the test which is proper for detecting the substance we are extracting, such as a solution of gelatine for tannin, of alum for extractive, &c.

"The decoctions are to be depurated by colature; and afterwards suffered to stand for a day or two, when a considerable quantity of sediment is usually found at the bottom. If the liquor poured off clear be boiled down a little, and afterwards suffered to cool again, it will deposit a fresh sediment, from which it may be decanted before you proceed to finish the evaporation. The decoctions of very resinous substances do not require this treatment, and are rather injured by it; the resin subsiding along with the inactive dregs."

Such are the directions given in most of Dr. Duncan's editions of the *New Edinburgh Dispensatory*, for the depuration of the decoctions, and we have inserted them at full length, because, although we doubt very much of their propriety, our reasons for so doing are scarcely more than hypothetical. We would advise the decoctions to be evaporated after they have been filtered boiling hot, without any further depuration; because some of the most active principles of vegetable substances, such as tannin, are much more soluble in boiling than in cold water, and because almost all of them are very quickly affected by exposure to the atmosphere. Therefore, if a boiling decoction, saturated with tannin, be allowed to cool, the greatest part of the very principle on which the activity of the substance depends will separate to the bottom, and according to the above directions, will be thrown away as sediment. The same objection applies more strongly to allowing the decoction to cool, and deposit a fresh sediment, after it has been partially evaporated. Besides, by allowing the decoctions to stand several days before we proceed to their evaporation, we are in fact allowing the active principles contained in the decoction to be altered by the action of the air, and to be converted into substances, perhaps

P H A R M A C Y.

inactive, which also are thrown away as sediment.

The evaporation is most conveniently performed in broad shallow vessels: the larger the surface of the liquor, the sooner will the aqueous parts exhale. This effect may likewise be promoted by agitation.

When the matter begins to grow thick, great care is necessary to prevent its burning. This accident, almost unavoidable if the quantity be large, and the fire applied as usual under the evaporating pan, may be effectually prevented, by carrying on the inspissation, after the common manner, no farther than the consistence of a syrup, when the matter is to be poured into shallow tin or earthen pans, and placed in an oven, with its door open, moderately heated; which acting uniformly on every part of the liquid, will soon reduce it to any degree of consistence required. This may likewise be done, and more securely, by setting the evaporating vessel in boiling water: but the evaporation is in this way very tedious.

Alcohol is much too expensive to be employed as a menstruum for obtaining extracts, except in those cases where water is totally inadequate to the purpose. These cases are, 1. When the nature of the extract is very perishable when dissolved in water, so that it is liable to be decomposed before the evaporation can be completed, especially if we cannot proceed immediately to the evaporation. 2. When water is totally incapable of dissolving the substance to be extracted; and, 3. When the substance extracted can bear the heat of boiling alcohol, without being evaporated, but would be dissipated by that of boiling water; that is, when it requires a heat greater than 176° , and less than 212° , for its vaporization.

In the last case, the alcohol must be perfectly free from water, because the heat necessary to evaporate it at the end of the process would frustrate the whole operation. Hence, also, the subject itself ought always to be dry: those substances which lose their virtue by drying, lose it equally on being submitted to this treatment with the purest alcohol.

In this way the alcoholic extract of some aromatic substances, as cinnamon, lavender, rosemary, retain a considerable degree of their fine flavour. In the second case, the alcohol need not be so very strong, because it is still capable of dissolving resinous substances, although diluted with a considerable proportion of water. In the first case, the alcohol may be still much weaker: or rather, the addition of a small proportion of alcohol to water will be sufficient to retard or prevent the decomposition of the decoction.

The alcohol employed in all these cases should be perfectly free from any unpleasant flavour, lest it be communicated to the extract.

The inspissation should be performed from the beginning, in the gentle heat of a water-bath. We need not suffer the alcohol to evaporate in the air; the greatest part of it may be recovered by collecting the vapour in common distilling vessels. If the distilled spirit be found to have brought over any flavour from the subject, it may be advantageously reserved for the same purposes again.

When diluted alcohol is employed, the distillation should only be continued as long as alcohol comes over; and the evaporation should be finished in wide open vessels,

Pure resins are prepared, by adding to spirituous tinctures of resinous vegetables a large quantity of water. The resin, incapable of remaining dissolved in the watery liquor, separates and falls to the bottom, leaving in the menstruum such other principles of the plant as the spirit might have extracted at first along with it. But this is only practised for the purpose of analysis.

Extracts made with Water only.—*Extractum gentianæ luteæ*, Edin. extract of gentian. Having cut and bruised any quantity of gentian, pour upon it eight times its quantity of water. Boil to the consumption of one half of the liquor, and strain it by strong expression. Evaporate the decoction immediately to the consistence of thick honey, in a bath of water saturated with muriate of soda.

In the same manner are prepared extracts

Of the roots of liquorice, *extractum glycyrrhizæ glabræ*.

Of the roots of black hellebore, *extractum hellebori nigri*.

Of the leaves of rue, *extractum rutæ graveolentis*.

Of the leaves of senna, *extractum cassiæ senæ*.

Of the flowers of camomile, *extractum anthemidis nobilis* (chamæmeli).

Of the heads of white poppy, *extractum papaveris albi*.

Of logwood, *extractum hæmatoxyli Campechensis*.

Extract of broom tops, *extractum cacuminis genistæ*.

Extract of camomile, *extractum chamæmeli*.

Extract of savin, *extractum sabina*.

The other extracts of this division are,

Extractum cinchonæ, Lond. extract of Peruvian bark.

Extractum hæmatoxyli, Lond. extract of logwood.

Extractum opii, Lond. extract of opium.

Extractum humuli, extract of hop, Lond.

Extracts made with Alcohol and Water—*Extractum cinchonæ officinalis*, Edin. *extractum cinchonæ osum resin*, Lond. resin of bark.

Extractum radici convolvuli jalapæ, Edin. *extractum jalapæ*, Lond. resin of jalap.

Extractum colocynthidis, Lond.

Extractum colocynthidis compositum, compound extract of colocynth.

The following new preparations in the London Pharmacopœia are obtained from the expressed juices alone, without either water or alcohol.

Extractum belladonnæ, extract of belladonna.

Extractum conii, extract of hemlock.

Extractum hyoscyami, extract of henbane.

CLASS XXI. Pulveres. Powders.

This form is proper for such materials only as are capable of being sufficiently dried to become pulverisable without the loss of their virtue. There are several substances, however, of this kind, which cannot be conveniently taken in powder; bitter, acrid, fetid drugs are too disagreeable; emollient and mucilaginous herbs and roots are too bulky; pure gums cohere, and become tenacious in the mouth, fixed alkaline salts deliquesce when exposed to the air, and volatile alkalies exhale. Many of the aromatics, too, suffer a great loss of their odorous principles when kept in powder; as in that form they expose a much larger surface to the air.

P H A R M A C Y.

The dose of powders in extemporaneous prescription is generally about half a drachm: it rarely exceeds a whole drachm, and is not often less than a scruple. Substances which produce powerful effects in smaller doses are not trusted to this form, unless their bulk be increased by additions of less efficacy; those which require to be given in larger ones are better fitted for other forms.

The usual vehicle for taking the lighter powders is any agreeable thin liquid. The ponderous powders, particularly those prepared from metallic substances, require a more consistent vehicle, as syrups; for from thin ones they soon subside: resinous substances likewise are most commodiously taken in thick liquors, for in thin ones they are apt to run into lumps, which are not easily again soluble.

Pulvis aloes compositus, Lond. powder of aloes, compound.

Pulvis aromaticus, Dubl. powder aromatic.

Pulvis asari compositus, Dubl. powder of asarabacca, compound.

Pulvis cretæ compositus, Lond. *pulvis carbonatis*, calcis comp. Edin. powder of chalk, compound.

Pulvis cretæ compositus cum opio, Lond. powder of chalk, compound with opium.

Pulvis contrayervæ comp. Lond. powder of contrayerva, compound.

Pulvis ipecacuanhæ comp. Lond. *pulvis ipecacuanhæ et opii*. Edin. powder of Dover's.

Pulvis scammoniæ comp. Lond. Edin. Dubl. powder of scammony, compound.

Pulvis senæ compositus, Lond. powder of sena, compound.

Pulvis sulphatis aluminæ comp. Edin. powder of styptic.

Pulvis tragacanthæ compositus, Lond. powder of tragacanth, compound.

Pulvis cinnamomi com. Lond. compound powder of cinnamon.

Pulvis cornu asticum opio, Lond. powder of burnt hartshorn with opium.

Pulvis kino comp. Lond. compound powder of kino.

CLASS XXII. *Confectiones*. *Confections*.

Under this title we include all those preparations which have hitherto been loosely denominated conserves, electuaries, and confections; the difference in the preparation of which being too trifling for distinct heads: and the new London Pharmacopœia has pursued the same plan.

Confections are, for the most part, compositions of recent vegetable matters and sugar, beaten or otherwise mixed together into an uniform mass. The sugar should be pounded by itself, and passed through a sieve before it be mixed with the vegetable mass, for without this it cannot be properly incorporated. It is obvious that, from the large admixture of sugar, only substances of considerable activity can be taken with advantage in this form. Conservæ are hence, for the most part, only auxiliary to medicines of greater activity; as, for example, for reducing into bolusses or pills the more ponderous powders, as calomel, oxyds of iron, and other mineral preparations.

Electuaries are composed chiefly of powders mixed up with syrups, &c. into such a consistence, that the powders may not separate in keeping, that a dose may be easily taken up on the point of a knife, and not prove too stiff to swallow.

Electuaries receive chiefly the milder alterative medicines, and such as are not ungrateful to the palate. The more powerful drugs, as cathartics, emetics, opiates, and the like (except in official electuaries to be dispensed by weight), are seldom trusted in this form, on account of the uncertainty of the dose: disgusting ones, acrids, bitters, fetids, cannot be conveniently taken in it; nor is the form of an electuary well fitted for the more ponderous substances, as mercurials, these being apt to subside on keeping, unless the composition be made very stiff.

The lighter powders require thrice their weight of honey, or syrup boiled to the thickness of honey, to make them into the consistency of an electuary: of syrups of the common consistence, twice the weight of the powder is sufficient.

Where the common syrups are employed, it is necessary to add likewise a little conserve, to prevent the compound from candying and drying too soon. Electuaries of Peruvian bark, for instance, made up with syrup alone, will often, in a day or two, grow too dry for taking.

This is owing to the crystallization of the sugar. Deyeux, therefore, advises electuaries, confections, and conserves, to be made up with syrups from which all the crystallizable parts have been separated. For this purpose, after being sufficiently evaporated, they are to be exposed to the heat of a stove as long as they form any crystals. The syrup which remains, probably from the presence of some vegetable acid, has no tendency to crystallize, and is to be decanted and evaporated to a proper consistence. In hospital practice, the same object may be obtained much more easily by using molasses instead of syrups.

The quantity of an electuary, directed at a time, in extemporaneous prescription, varies much according to its constituent parts, but is rarely less than the size of a nutmeg, or more than two or three ounces.

The conservæ are,
Citri aurantii, Edin. aur. hispalensis, Lond. conserve of orange peel.

Rosæ caninæ, Edin. Lond. conserve of hips.

Rosæ rubræ, Edin. *rosæ gallica*, Lond. *rosæ*, Dubl. conserve of red rose buds.

Lujulæ, acetosellæ, Dubl. conserve of wood sorrel.

All these are denominated, as we have already observed, confections, instead of conserves in the new London Pharmacopœia.

Pluck the leaves from the stalks, the unblown petals from the cups, taking off the heels. Take the outer rind of the oranges by a grater.

When prepared in this way, beat them with a wooden pestle in a marble mortar, first by themselves, afterwards with three times their weight of double refined sugar, until they be mixed.

The only exceptions to these general directions, which are those of the London college, are, that the London college adds only twenty ounces of sugar to one pound of the pulp of hips, and that the Dublin add only twice their weight of sugar to the sorrel leaves. La Grange says, that by infusing the red rose leaves in four times their weight of water, which is afterwards to be expressed from them, they lose their bitterness, and are more easily reduced to a pulp, which he then mixes with a thick syrup, prepared by dissolving the sugar in the expressed liquor, and boiling it down to the consistence of an electuary.

It is scarcely necessary to make any particular

PHARMACY.

remarks on these conserves. Their taste and virtues are compounded of those of sugar, and the substance combined with it. The wood sorrel and hips are acidulous and refrigerant; the orange-rind and wormwood bitter and stomachic, and the red rose buds astringent.

The electuaries and confections are as follow:

Electuarium cassiæ, Dubl. confectio cassiæ, Lond. electuarium cassæ fistulæ, Edin. electuary of cassia.

Electuarium cassiæ sennæ, Edin. confectio sennæ, Lond. electuary lenitive.

Electuarium catechu, Edin. electuary of catechu.

Electuarium catechu, comp. Dubl. electuary of catechu, compound.

Electuarium scammonii, Dubl. confectio scammonii, Lond. electuary of scammony.

Electuarium opiatum, Edin. confectio opiato, Lond. electuary of opium, opiate confection.

Confectio aromatica, Lond. aromatic confection.

Confectio amygdalæ, Lond. almond confection.

CLASS XXII. Trochisci. Troches.

Troches and lozenges are composed of powders made up with glutinous substances into little cakes, and afterwards dried. This form is principally made use of for the more commodious exhibition of certain medicines, by fitting them to dissolve slowly in the mouth, so as to pass by degrees into the stomach: and hence these preparations have generally a considerable proportion of sugar or other materials grateful to the palate. Some powders have likewise been reduced into troches, with a view to their preservation; though possibly for no very good reasons; for the moistening, and afterwards drying them in the air, must in this light be of greater injury than any advantage accruing from this form can counterbalance.

Trochisci carbonatis calcis, Edin. troches of chalk.

Trochisci glycyrrhizæ, Dubl. troches of liquorice.

Trochisci glycyrrhizæ cum opio, Edin. Dubl. troches of liquorice with opium.

Trochisci gummosi, Edin. troches of starch with gum arabic.

Trochisci nitratis potassæ, Edin. troches of nitre.

The London Pharmacopœia has banished the name entirely.

CLASS XXIII. Pilulæ. Pills.

The masses for pills are best kept in bladders, which should be moistened now and then with some of the same kind of liquid that the mass was made up with, or with some proper aromatic oil. When the mass is to be divided into pills, a given weight of it is rolled out into a cylinder of a given length, and of an equal thickness throughout, and is then divided into a given number of equal pieces, by means of a simple machine. These pieces are then rounded between the fingers; and, to prevent them from adhering, they are covered either with starch, or powder of liquorice, or orris root. In Germany the powder of lycopodium is much used.

To this form are peculiarly adapted those drugs which operate in a small dose, and whose nauseous

and offensive taste or smell require them to be concealed from the palate.

Pills should have the consistence of a firm paste, a round form, and a weight not exceeding five grains. Essential oils may enter them in small quantity: deliquescent salts are improper. Efflorescent salts, such as carbonate of soda, should be previously exposed so as to fall to powder: deliquescent extracts should have some powder combined with them. The mass should be beaten until it become perfectly uniform and plastic. Powders may be made into pills with extracts, balsams, soap, mucilages, bread-crumbs, &c.

Gummy resins, and inspissated juices, are sometimes soft enough to be made into pills, without addition: where any moisture is requisite, spirit of wine is more proper than syrups or conserves, as it unites more readily with them, and does not sensibly increase their bulk. Light dry powders require syrup or mucilages: and the more ponderous, as the mercurial and other metallic preparations, thick honey, conserve, or extracts.

Light powders require about half their weight of syrup; or of honey, about three fourths their weight; to reduce them into a due consistence for forming pills. Half a drachm of the mass will make five or six pills of a moderate size.

Gums and inspissated juices are to be first softened with the liquid prescribed: the powders are then to be added, and the whole beat thoroughly together, till they be perfectly mixed.

Pilulæ aloeticæ, Edin. Dubl. pills aloetic.

Pilulæ aloes compositæ, Lond. pills aloetic, compound.

Pilulæ aloes cum asafœtida, Edin. pills aloetic with asafœtida.

Pilulæ aloes cum colocynthide, Edin. pills aloetic with colocynth.

Pilulæ aloes cum myrrha, Lond. pills aloetic with myrrh.

Pilulæ asafœtida compositæ, Edin. pills of asafœtida, compound.

Pilulæ galbani compositæ, Lond. pills of galbanum, compound.

Pilulæ ammoniacreti cupri, Edin. pills of ammoniacret of copper.

Pilulæ hydrargyri, Lond. Edin. Dubl. pills of quicksilver.

Pilulæ saponis cum opio, Lond. pilulæ opiatæ, Edin. pills of opium.

Pilulæ rhei compositæ, Edin. pills of rhubarb, compound.

Pilulæ scillæ comp. Lond. Dubl. Edin. pills of squills.

Pilulæ stibii compositæ, Dubl. pills of antimony, compound: Plummer's.

Pilulæ cambogiæ compositæ, Lond. compound pills of camboge.

The common mercurial pill is one of the best preparations of mercury, and may, in general, supersede most other forms of this medicine. In its preparation the mercury is minutely divided, and probably converted into the black oxyd. To effect its mechanical division it must be triturated with some viscid substance. Soap, resin of guaiac, honey, extract of liquorice, manna, and conserve of roses, have all been at different times recommended. The soap and guaiac have been rejected, on account of their being decomposed by the juices of the stomach; and the honey, because it was apt to gripe some people. With regard to the others, the grounds of selection are not well understood; perhaps the acid contained

P H A R M A C Y.

in the conserve of roses may contribute to the extinction of the mercury. We learn when the mercury is completely extinguished, most easily, by rubbing a very little of the mass with the point of the finger on a piece of paper, if no globules appear. As soon as this is the case, it is necessary to mix with the mass a proportion of some dry powder, to give it a proper degree of consistency. For this purpose powder of liquorice root has been commonly used; but it is extremely apt to become mouldy, and to cause the pills to spoil. The Edinburgh College have, therefore, with great propriety, substituted for it starch, which is a very inalterable substance, and easily procured at all times in a state of purity. It is necessary to form the mass into pills immediately, as it soon becomes hard. One grain of mercury is contained in four grains of the Edinburgh mass, in three of the London, and in two and a half of the Dublin. The dose of these pills must be regulated by circumstances; from two to six five-grain pills may be given daily.

CLASS XXIV. *Cataplasmata. Cataplasms.*

By cataplasms are generally understood those external applications which are brought to a due consistence or form for being properly applied, not by means of oily or fatty matters, but by water or watery fluids. Of these many are had recourse to in actual practice; but they are seldom prepared in the shops of the apothecaries, and in some of the best modern Pharmacopœias no formula of this kind is introduced. The London and Dublin Colleges, however, although they have abridged the number of cataplasms, still retain one or two; and it is not without some advantage that there are fixed forms for the preparation of them.

Coagulum aluminis, *Dubl. cataplasm of alum, alum curd.*

Cataplasma fermenti, *yest cataplasm.*

Cataplasma sinapis, *Lond. Dubl. cataplasm of mustard.*

Cataplasms of mustard are commonly known by the name of sinapisms. They were formerly frequently prepared in a more complicated state, containing garlic, black soap, and other similar articles; but the above simple form will answer every purpose which they are capable of accomplishing. They are employed only as stimulants: they often inflame the part and raise blisters, but not so perfectly as cantharides. They are frequently applied to the soles of the feet in the low state of acute diseases, for raising the pulse and relieving the head. The chief advantage they have depends on the suddenness of their action.

CLASS XXV. *Linimenta. Liniments.*

CLASS XXVI. *Unguenta. Ointments.*

CLASS XXVII. *Cerata. Cerates.*

CLASS XXVIII. *Emplastra. - Plasters.*

We connect these together as being all oleaginous or fatty combinations for external application, and as merely differing from each other in their degree of consistency. Deyeux has, indeed, lately defined plasters to be combinations of oil with metallic oxyds; but as this would comprehend many of our present ointments, and exclude many of our plasters, we shall adhere to the old meaning of the terms.

Liniments are the thinnest of these compositions, being only a little thicker than oil.

Ointments have generally a degree of consistence like that of butter.

Cerates are firmer, and contain a larger proportion of wax.

Plasters are the most solid, and when cold should be firm, and not adhere to the fingers; but when gently heated should become sufficiently soft to spread easily, and should then adhere to the skin.

Plasters derive their firmness either from a large proportion of wax, resin, &c. or from the presence of some metallic oxyd, such as that of lead.

Plasters then should have such a consistence, that although when cold they do not adhere to the fingers, they become soft and plastic when gently heated. The heat of the body should render it tenacious enough to adhere to the skin, and to the substance on which it is spread. When prepared, it is usually formed into rolls, and inclosed in paper. Plasters of a small size are often spread on leather, sometimes on strong paper, by means of a heated spatula, or the thumb. The leather is cut of the shape wanted, but somewhat larger; and the margin all round, about a quarter of an inch in breadth, is left uncovered, for its more easy removal when necessary. Linen is also often used, especially for the less active plasters, which are used as dressings, and often renewed. It is generally cut into long slips of various breadths, from one to six inches. These may either be dipped into the melted plaster, and passed through two pieces of straight and smooth wood, held firmly together, so as to remove any excess of plaster; or what is more elegant, they are spread on one side only, by stretching the linen, and applying the plaster, which has been melted and allowed to become almost cold, evenly by means of a spatula, gently heated, or, more accurately, by passing the linen on which the plaster has been laid, through a machine formed of a spatula fixed, by screws, at a proper distance from a plate of polished steel.

To prevent repetition, the Edinburgh College give the following canon for the preparation of these substances:

“In making these compositions, the fatty and resinous substances are to be melted with a gentle heat, and then constantly stirred; adding, at the same time, the dry ingredients, if there be any, until the mixture, on cooling, becomes stiff.”

Linimentum simplex, *Edin. simple liniment, wax and oil.*

Oleum ammoniatum, *Edin. linimentum ammoniæ carbon. Lond. oil or liniment of ammonia, volatile liniment.*

Linimentum ammoniæ fortius, *Lond. volatile liniment, stronger.*

Oleum lini cum calce, *Edin. linseed oil with lime.*

Oleum camphorat, *Ed. camphorated oil.*

Unguentum simplex, *Edin. ointment of simple wax and oil.*

Unguentum spermatis ceti, *Dubl. cetacei, Lond. ointment of spermaceti.*

Unguentum, *Lond. Dubl. ointment of wax.*

Unguentum acidi nitrosi, *Edin. ointment of nitrous acid.*

Unguentum resinæ flavæ, *Dubl. ointment of yellow resin.*

Unguentum elemi, *Dubl. unguentum elemie compositum, Lond. ointment of elemi.*

Unguentum picis, *Lond. Dubl. ointment of tar. The London has two kinds.*

Unguentum sambuci, *Lond. Dubl. ointment of elder.*

Unguentum cantharidis, *Dubl.* ointment of cantharides.

Unguentum infusi meloes vesicatorii, *Edin.* ointment of mild epispastic.

Unguentum pulveris meloes vesicatorii, *Edin.* ointment of stronger epispastic.

Unguentum hellebori albi, *Dubl.* ointment of white hellebore.

Unguentum sulphuris, *Lond. Dubl.* ointment of sulphur.

Unguentum oxydi plumbi albi, *Edin.* ointment of oxyd of white lead.

Unguentum acetitis plumbi, *Edin.* the acetite of lead, saturnine ointment.

Unguentum cerussæ acetatæ, *Dubl.* ointment of acetated ceruse.

Unguentum hydrargyri, *Edin.* ointment of quicksilver.

Unguentum hydrargyri fortius, *Lond. Dubl.* ointment of quicksilver, stronger.

Unguentum hydrargyri mitius, *Lond. Dubl.* ointment of quicksilver, milder.

Unguentum hydrargyri præcipitati albi, *Lond.* ointment of white precipitate.

Unguentum nitratis hydrargyri, *Edin. Lond.* citrine ointment.

Unguentum subacititis cupri, *Edin.* ointment of verdigris.

Unguentum oxyd zinci impuri, unguentum tutiæ, *Dubl.* ointment of tutty.

Unguentum oxydi zinci, *Edin. Lond.* ointment of oxyd of zinc.

Ceratum cetacei, *Lond.*

Ceratum simplex, *Edin.* ceratum spermatis ceti, *Dubl.* cerate of spermaceti.

Ceratum resinæ flavæ, *Dubl.* cerate of yellow resin.

Ceratum cantharidis, *Dubl.* cer. lythæ, *Lond.* cerate of cantharides.

Ceratum saponis, *Dubl.* cerate of soap, cer. plumbi superacetatis, *Lond.*

Ceratum plumbi compositum, *Lond.* saturnine cerate.

Ceratum carbonatis zinci impuri, *Edin.* cerate of carbonate of zinc.

Ceratum calaminæ, *Lond. Dubl.* cerate of calamine; epulotic; *Turner's.*

Emplastrum ceræ, *Dubl. Lond.* emplastrum simplex, *Edin.* plaster of wax, drawing.

Emplastrum picis Burgundicæ, *Dubl.* emplastrum picis Burgundicæ, composit. *Lond.* plaster of Burgundy pitch.

Emplastrum cumini, *Lond.* plaster of cummin.

Emplastrum cantharidis, *Dubl.* emplastrum *Lond.* emplastrum lyttæ *Edin.* plaster of cantharides.

Emplastrum meloes vesicatorii, composit. *Edin.* plaster of cantharides, compound.

Emplastrum oxydi plumbi semivitrei, *Edin.* emplastrum lithargyri, plaster of common litharge.

Emplastrum resinorum, *Edin.* emplastrum lithargyri cum resina, *Lond.* plaster adhesive.

Emplastrum asafetidæ, *Edin.* plaster of gum or asafetida.

Emplastrum plumbi, *Lond.* lead-plaster.

Emplastrum saponis, *Dubl.* *Lond.* emplastrum saponaceum, *Edin.* plaster of soap.

Emplastrum hydrargyri, *Edin.* plaster of quicksilver.

Emplastrum ammoniaci cum hydrargyro, *Lond.* plaster of gum ammoniac with quicksilver.

Emplastrum oxydi ferri rubri, *Edin.* plaster of red oxyd of iron.

We shall close this article by observing, that the adult dose of the different preparations, and materials of which they are composed, will for the most part be found in the article MATERIA MEDICA, and by referring our readers for the chief authorities under which pharmacy has been advanced and brought to its present state of perfection to the article PHARMACOPŒIA.

PHARNACEUM, in botany, a genus of the class pentandria, order trigynia. Calyx five-leaved; corolless; capsule three-celled, many-seeded. Fourteen species - most of them Cape plants, one of Russia, one of Guinea.

PHARO is the name of a game of chance. See PHARAON.

PHAROS, (*Homer, Strabo, &c.*) a small oblong island, adjoining to the continent of Egypt, over against Alexandria. On this island stood a cognominal light-tower, of four sides, each side a stadium in length; and the tower so high as to be seen 100 miles off. Some affirm each of its four corners rested on a large sea-crab of glass, or of hard transparent stone of Ethiopia or Memphis. Others imagine the crabs were only added externally to the base by way of ornament, or as emblematical of its situation and use. The architect was Sostrates the Cnidian, as appears by an inscription on the tower, under Ptolemy Philadelphus, who laid out 800 talents upon it. On account of the port of Alexandria, the entrance to which was difficult and dangerous, the Pharos was called the key of the Egyptian sea, or even of Egypt itself (*Lucan*): and Pharos, from being a proper name, is become an appellation to denote all light-houses.

PHAROS, or PHARE, a light-house; a pile raised near a port, where fire is kept burning in the night, to guide and direct vessels near at hand. The pharos of Alexandria, built in the island of Pharos, at the mouth of the Nile, was anciently very famous, inasmuch as to communicate its name to all the rest. This most magnificent tower consisted of several stories and galleries, with a lantern at top, in which a light being continually burning, might be seen for many leagues at sea, and along the coast. It was accounted one of the seven wonders of the world. It was built by the famed architect Sostrates, a native of Cnidos, or, according to some, by Deiphanes, the father of Sostrates; and cost Ptolemy Philadelphus 800 talents. The several stories were adorned with columns, balustrades, galleries of the finest marble and workmanship; to which some add, that the architect had contrived to fasten some looking-glasses so artificially against the highest galleries, that one could see in them all the ships that sailed on the sea for a great way. Instead of which noble structure, one sees now only a kind of irregular castle, without ditches or outworks of any strength, the whole being accommodated to the inequality of the ground

on which it stands, and which it seems is no higher than that which it should command. Out of the midst of this clumsy building rises a tower, which serves for a light-house, but which hath nothing of the beauty and grandeur of the old one. The Colossus of Rhodes also served as a pharos.

PHARPAR, or **PHARPHAR**, is one of the rivers of Damascus, or rather it is an arm of the Barrady or Chrysorrhoas, which waters the city of Damascus and the country about it (2 Kings v. 12.) "Are not Abana and Pharpar, rivers of Damascus, better than all the waters of Israel?" The river of Damascus has its fountain in the mountains of Libanus.

PHARSALIA, a town of Thessaly, famous for a battle fought near it on 12th of May, B.C. 48, between Julius Cæsar and Pompey, in which the former obtained the victory. Cæsar lost about 200 men, or, according to others, 1200. Pompey's loss was 15,000, or 25,000, according to others, and 24,000 of his army were made prisoners. The poem of Lucan, in which he gives an account of the civil wars of Cæsar and Pompey, bears the name of Pharsalia. See **LUCANUS**.

PHARUS, in botany, a genus of the class monocæcia, order hexandria. Calyx, glume two-valved, [one flowered. Male: corol, glume two-valved. Fem.: corol, glume one-valved, long, involving; seed one. Three species: grasses of the East and West Indies.

PHARYNGOTOMY. *s.* (φαρυγξ and τεμνω.) The act of making an incision into the wind-pipe, used when some tumour in the throat hinders respiration.

PHARYNX. (φαρυγξ απο τη φεραν, because it conveys the food into the stomach.) The muscular bag at the back part of the mouth. It is shaped like a funnel, adheres to the fauces behind the larynx, and terminates in the œsophagus. Its use is to receive the masticated food, and to convey it into the œsophagus. See **ANATOMY**.

PHARZA, anciently **PHARSALIA**, a town of Turkey in Europe, in Jauna, famous for the decisive victory gained by Julius Cæsar over Pompey, in 48 B. C. This town is an archiepiscopal see, and seated on the Enipeus, a few miles S. of Larissa.

PHASCUM, in botany, a genus of the class cryptogamia, order musci. Capsule ovate, every-where closed, or with the mere rudiment of a lid, not opening. Sixteen species, all indigenous mosses.

PHASEOLUS. Kidney-bean. In botany, a genus of the class diadelphia, order decandria. Keel with the stamens and style spirally twisted. Twenty-four species; natives of the East or West Indies, America, or the Cape: of which some are climbing, some erect. Of these *P. vulgaris*, or common kidney-bean, is that chiefly cultivated in our own country. Stem twining; raceme solitary, shorter than the leaves; peduncles in pairs; bractes less than the calyx,

spreading; legumes pendulous. A native of India.

The varieties produced and still continued from this species are very numerous; the following are those most in repute:

1. The common white or Dutch kidney-bean.
2. The smaller kidney-bean, commonly called the Battersea kidney-bean. And, 3. The upright sort, called the tree kidney-bean. The first sort was sometime ago greatly propagated in England, and is still in Holland: it grows very tall, and requires long stakes and poles to climb on, and its beans are considerably broad; this makes them less saleable in the markets, people supposing them to be old because they are broad; and they are hence grown into disuse, though a much more valuable kind for eating than any other. The second sort, or Battersea bean, is what is more universally cultivated; it never grows very tall nor rambles far, and the air can easily pass between the rows, because of its moderate growth; and this makes it bear plentifully and ripen well for table. It is the best tasted bean, except the preceding. The third, or tree kidney-bean, is also a plentiful bearer and never rambles, but grows up in form of a shrub: its beans are broader than the Battersea kind, and are not so well tasted. They are all propagated from seeds, which are to be put into the ground in the latter end of March, or beginning of April, for an early crop, but these should have a warm situation and a dry soil; they must also be planted in a dry season. The manner of planting them is to draw lines with a hoe over the bed, at two feet and a half distance, into which the seeds are to be dropped at about two inches asunder, and the earth is to be drawn over them with the head of a rake, to cover them about an inch deep. In a week after sowing, the plants will appear, and the earth should be drawn up about their stalks as they rise up; for a few days after this, they will require no farther care, except to be kept clear from weeds, and when the beans appear, to have them gathered twice a week; for if the beans are suffered to hang on too long they not only become of no value, but they weaken the plant. The first crop of kidney-beans will continue a month in good order; and to supply the table afterwards, there should be fresh sowing in March, April, May, and June, the last of which will continue till the frosts come to destroy them. Some raise their early crops on hot-beds; and this is to be done exactly in the same manner as the raising the early cucumbers.

PHASES, in astronomy, from the Greek word φαινω, to appear: the several appearances or quantities of illumination of the Moon, Venus, Mercury, and the other planets. See **ASTRONOMY**.

PHASIANUS. Pheasant. Cock and hen. Bill short, strong; cheeks covered with a smooth, naked skin; legs generally with spurs. Fifteen species; scattered over the globe. The following are the chief;

P H A S I A N U S.

1. *P. gallus*. Cock and hen. This species embraces fifteen varieties.

a. Wild cock. Comb on the crown and two wattles on the chin compressed; ears naked; tail compressed, erect; feathers of the neck linear, long, membranaceous at the tips.

c. Common cock. Comb on the crown, and two wattles on the chin compressed; ears naked; tail compressed, erect; feathers of the neck linear, long.

γ. Crested cock. Crown with a thick downy crest.

δ. Darking cock. Feet five-toed, two behind.

ε. Frizzled cock. All the feathers turned back.

ξ. Persian cock. No rump or tail-feathers.

η. Dwarf cock. Legs very short.

θ. Bantam cock. Shanks feathered; the feathers behind long.

ι. Rough-legged cock. Legs feathered down to the toes.

κ. Turkish cock. Variegated with beautiful colours.

λ. Paduan cock. Body twice as large.

μ. Negro cock. Chest, wattles, and chin black.

ν. Crowned hen. Hen with crown tuberos.

ξ. Horned cock. Crown horned.

ζ. Silk cock. Feathers resembling hairs.

The cock and hen came originally from Asia, perhaps from Persia. Aristophanes calls the cock the Persian bird. The period in which they were transported from that kingdom to the western parts of Europe is so remote, that it is beyond the reach of all authentic history. We know, from the sacred records, that they were common, in a domestic state, in Judæa. Cæsar mentions them in Britain, at a still earlier period, among the articles of food, which the rude natives were prohibited from eating, by the institutions of the Druids. But though poultry were early spread, from China, over the whole of the ancient continent, as far as the Cape Verd islands, and even Iceland, there is reason to believe, that they were unknown in America, till its conquest by the Europeans. They were thirty years introduced into Peru, before they became accustomed to breed there; and it is asserted, that, for some time after they were introduced into Brasil by the Spaniards, the Indians were so little acquainted with them, that they deemed their eggs impure and poisonous.

The male and female of this species are extremely different in their outward appearance. The comb, wattles, neck, tail, and spurs, all sufficiently characterize the cock. The hen has less brilliancy of colour, and, in her manners, less gravity, fierceness, and pride. There are some hens, indeed, whose sex seems ambiguous; who have spurs upon their legs, and a comb upon their head, resembling those of the cock; and who endeavour, according to Aristotle, to imitate him in things still more essential. These may be regarded as herma-

phrodites, without sex, and depraved even in the common and essential organs of the species, since they are incapable of perpetuating it. The hen is, in general, more slender in all her proportions than the cock; her legs are shorter; but her apparent bulk is increased by a larger quantity of feathers.

The cock and hen, that are so perfectly familiar to us in their domestic state, are so seldom found in their natural freedom, that mankind seem to have forgotten their manners and form in that condition. Even in Persia, their native country, they are not now found wild; and had they not been seen by some travellers since the advancement of commerce and navigation, their primitive appearance, like that of the wild sheep, would have been unknown. In the kingdom of Congo, the island of Tinian, and the Philippines, the poultry are still found in their ancient state of independence. There, the plumage of the cock is black and yellow; his comb and wattles are yellow and purple. There are some found in the Indian woods, that have this farther peculiarity, that their bones, when boiled, are as black as ebony; a circumstance which arises, probably, from some particular food which may communicate that tincture, as madder, with us, is known to dye them red.

The common hen is perhaps the most fertile of all birds. Excepting the space of about two months in the moulting season, she frequently lays an egg every day, especially if kept sufficiently warm, and well fed. When in her wild state, she generally begins to hatch after laying fifteen or sixteen; and it is only from the circumstance of abstracting her eggs, that she produces a greater number when tame. Many other birds are capable of making a similar effort, to regain the usual number of their eggs, when by any accident these have been destroyed. Although of all mothers the most careful of her offspring, the hen is not capable of rearing much above a dozen of chicks. The size of her body will not communicate heat to a greater number of eggs, nor afford sufficient shelter and warmth to a more numerous brood, when hatched. To remedy this defect, and avail themselves more completely of her fertility, many contrivances have been suggested by the ingenious. It has been found, that any kind of heat may be substituted for that created by the body of the hen: hence the invention of stoves, by which not only the whole produce of the hen, but several thousands of eggs, may be hatched at once. In the warm climate of Egypt, where the young need no shelter or clucking after they are excluded from the shell, immense numbers can be reared in this manner; and the scheme is practised to a considerable extent. In our colder and more variable climate, the young may indeed, without much difficulty, be hatched; but without the warmth and shelter of the mother, they must soon perish, after being excluded. To remedy this, an ingenious French naturalist has suggested the use of a woollen hen, or false mother;

PHASIANUS.

which is nothing more than applying over them a warm canopy of thick woollen cloth: and this plan has lately been improved upon by several breeders in our own country.

But a much more natural and advantageous substitute for the care of the mother has been found, in training the capon to cluck young; an office which he soon learns to perform with affection and assiduity, and, from the greater size of his body, with more success than the hen herself. All that is necessary for this purpose is, to confine him for some time in a dark coop, bringing him out to feed, at stated times, with a number of chickens already considerably advanced. By degrees, he will thus become fond of their society, and will allow them regularly to enjoy the shelter and warmth of his body. The hen, thus relieved of her charge, will again soon resume the business of laying, and preparing a second family, and the capon, condemned to sterility, will still contribute, although indirectly, to the multiplication of his species.

The extraordinary courage of the cock is universally known in almost every country, which has been already noticed. The custom of making them fight, and of turning into an amusement the invincible hatred, which nature has planted in the individuals of this species against each other, is a practice very ancient. The innate ferocity of these animals has been cultivated and increased with so much art, that the combats of the poultry yard have been deemed an interesting spectacle, even among polished nations. The Athenians and Rhodians were anciently much addicted to this irrational and barbarous amusement. Among the former, a particular day was annually consecrated to the amusement of cock-fighting. Ælian gives the following account of the origin of that custom. When Themistocles took the field to engage the Persians, he observed a timidity among his soldiers; and, among the various topics to which he had recourse to animate them, he mentioned the invincible courage of the cock. "Observe," said he, "with what intrepid valour he fights, while he has no motive but victory to impel him: while you have to contend for your religion and your liberty, for your wives and children, and for the tombs of your ancestors." This harangue, which, to a modern army, would appear ludicrous, is said to have inspired such courage into the Athenian soldiers, that they obtained a triumph, the most memorable which history records. It was in commemoration of this celebrated event that the Athenians instituted the annual games of cock-fighting.

The Rhodians were still more addicted to this practice. Their cocks were larger, stronger, and much more ferocious in battle, than the common kind; while the sexual passion was in them less frequent, and less ardent; and their hens, it is said, were also much less prolific. This seeming contrariety to the common laws of nature probably arose from their education. Being continually accustomed to ferocity and

rage, the softer passion was choked or weakened, although it was the original source of their courage, and the foundation of their warlike habits.

At present, cock-fighting is keenly pursued in China, in the Philippine isles, in Java, and in the isthmus of Darien. In Europe, the passion for this amusement has long been on the decline: still, however, there are many countries which pursue it with avidity; and in which the spectators interest themselves so deeply in the issue of the battle, that, in the language of Buffon, the fate of families is often determined by the last stroke of the victorious bird. If the ancient Romans were trained to ferocity by the bloody spectacles exhibited in the Campus Martius, by the gladiators, we should imagine that the practice of cock-fighting would be still more pernicious to the morals of nations, by adding habits of gambling to those of cruelty. See **COCK-FIGHT**.

The cock is the most salacious of all birds. His jealousy and courage seem to be the natural result of his salacity. One cock suffices for a dozen or fifteen hens: but, although surrounded by a numerous train of females, his jealousy is always in proportion to the force of his sexual appetite. The common poultry, which we continually employ in propagating their kind, probably soon exhaust the principles of life; and, therefore, in their domestic state, are not long-lived. As it is by mere accident, however, that any of them are allowed to reach the period assigned them by nature, and to die of old age, we are not able to ascertain exactly their longevity. Buffon supposes, that, in their domestic state, they may live twenty years, and, in their natural freedom, perhaps ten more.

In proportion as they are removed from their native country, and are habituated to different food and climate, all the poultry tribes undergo a change in their external appearance, and even in their size. From this cause arise all the endless varieties and sub-varieties described by different naturalists in colour and size. In all these varieties, however, the cock is distinguished by the characteristics of being very courageous, proud, watchful, and salacious: he claps his wings before he sings or crows; has a piercing sight, and never fails to cry in a peculiar note at the sight of a bird of prey. The common length is three feet four inches: feeds on grains and worms, which the hen shows to her chickens by scraping on the ground. The hen to lay the whole year requires plenty of water, food, and gravel, and a warm nest. After laying an egg she makes a loud clucking, which is answered by all the hens within hearing: she will not sit if she be immersed in cold water: she is hurt by elder-berries, and subject to lice, which, however, are destroyed by pepper.

2. *P. Mexicanus*. Courier pheasant. Tawny-white; tail long, shining green. Inhabits New Spain: eighteen inches long; slow in flight, but so swift on foot as to out run the fleetest horses.

P H A S I A N U S.

3. *P. cristatus*. Crested pheasant. Above brown, beneath reddish-white; vent rufous; head crested; orbits naked, red; tail wedged, tip with yellow. Inhabits New Spain: twenty-two inches long; frequents trees growing near the water; and feeds on serpents, worms, and insects.

4. *P. colchicus*. This species is the pheasant, properly so called, and comprises the following varieties:

a. Common pheasant. Rufous; head blue; tail wedged; cheeks papillous.

c. Ringed pheasant. Collar white.

γ. Variegated pheasant. White varied with rufous.

δ. White pheasant. White, with a few small black spots on the neck and rufous ones on the shoulders.

ε. Pied pheasant. Above rufous varied with brown and whitish; tail-feathers black edged with white.

ζ. Turkey pheasant. Orbits naked, red; rest of the head feathered.

Inhabits Africa and Asia; from two to three feet long; is domesticated every where; in breeding time above the ears on each side is a golden-feathered tuft like a horn.

5. *P. superbus*. Superb, or golden Chinese pheasant. Unarmed; rufous, varied with green and blue; caruncles of the front rounded; wattles subulate; bill and body red; crown green, the hind-part with a folding blue crest. By some naturalists regarded as a mere variety of *P. colchicus*. Inhabits China.

The pheasant, which, as we have just observed, is a native of Asia, is still farther traced by all the naturalists to Colchis or Mingrelia; whence it is said to have been brought down the river Phasis, into Greece, by the Argonauts, in their expedition in quest of the golden fleece. This fact, too remote to be well authenticated, is received on the testimony of Martial.

*Argivæ primum sum transportata carinæ;
Antè mihi notum nil, nisi phasis, erat.*

The pheasants of that country are still remarked to be the largest and most beautiful: hence, it probably was their original habitation, from which they have gradually spread, in succeeding ages, over the greatest part of the ancient continent. In Great Britain, and the northern parts of France, they are still rare. In Sweden, the severity of the climate has altogether prevented their propagation; though they have been lately introduced into Prussia and Silesia.

From its large size, and the shortness of its wings, the pheasant is necessarily a bird of heavy flight. Of course, it has never been able to cross those broad seas, which, in the warm latitudes, separate the old from the new continent, and to fly over to America. It has, however, been long reared in St. Domingo, by the Spaniards, who carried the breed from Europe.

Of all birds, except the peacock, the pheasant has the most beautiful and finely variegat-

ed plumage. The superb or golden China pheasant is said even to vie with that splendid bird, in the richness of its colours; but the whole race wants the power of raising and expanding the feathers of the tail, and also that slender form and those elegant proportions which so much enhance the charms of the peacock. The hen pheasant has not the same lustre as the male, whose plumage, though of a dark ground, shines with all the different reflections of gold, purple, and violet; varying constantly, according to the different points from which it is viewed. The rich lustre of the feathers of this bird depends upon their union and position with regard to each other; for a single feather, taken separately, appears only brown or black; the glossy shades of green and yellow disappearing.

The several varieties of the pheasant are occasioned partly by climate and partly by domestication. The white pheasant is, probably, a variety occasioned by the cold, if we may judge from the effects of climate on other animals. The spotted and the variegated pheasants are supposed to be a mixed race, arising from the union of the common species with the white; as the bastard pheasant is allowed to be the offspring of the pheasant and common hen, produced by domesticating the former in the poultry yard. The golden pheasant of China, the most beautiful of this genus, may be regarded rather as a variety than a different species. Buffon alleges, that these varieties are branches of the same original family, which, after a long separation, are still capable of forming alliances, and producing an offspring. The singular beauty of the golden pheasant has introduced it into the pheasantries of many parts of Europe, where successful attempts have been made to make it breed with our own. The prevailing colours of its plumage are red, yellow, and blue; and it is distinguished by a beautiful crest upon the head, which it raises at pleasure. The iris, the bill, and the legs, are yellow. The tail is longer, and more exquisitely enamelled, than that of the European species: above it, there proceed a number of long, straight feathers, of a scarlet hue, mixed with yellow; ornaments, for which it seems indebted to the influence of a milder and more serene sky.

The pheasants, in their wild state, feed, like the rest of the gallinaceous tribes, upon all kinds of grain and herbage. When young, they are very difficult to be reared; because they must then be supplied with ants-eggs, which constitute the food, to which, when wild and young, they are accustomed. Woodlice, earwigs, and other insects, are collected by those who rear them in order to vary their nourishment. From their extraordinary size, their beauty, and the delicacy of their flesh, they are every where considered by the sportsman as excellent game. There is, accordingly, no bird upon which such pains have been taken in its propagation, in parks and pheasantries: there is none, however, upon which the influ-

ence of domestication has been so inconsiderable. So wild are they by nature, that, even where they depend on man for support, they continually fly at his approach. They even avoid one another; for it is only in the months of March and April that the male and female associate together. They are then frequently discovered in the woods, by the noise which the male occasions by clapping his wings. When started, they make a whirring like the partridge, which warns the sportsman; and being a large mark, and flying very slow, there is no difficulty, even to an inexperienced shooter, to bring them to the ground.

The hen pheasant constructs her nest without the aid of her mate; and, generally, in the most secret and inaccessible corner of the forest. It is apparently a careless fabric of leaves and withered grass: when, however, supplied with a nest carefully built of these materials, she is never satisfied till it be new-modelled from the foundation, after her own manner. The number of her eggs is various, according to the climate, and her means of subsistence. She lays from a dozen to twenty; but when they are carried away, she continues, like the common hen, her vain efforts to fill the nest. After she has done breeding, she puts on the appearance of the male.

6. *P. argus*. Argus pheasant. Pale yellow spotted with black; face red; hind-head crested, blue; front, chin and throat, red; crested hind-head and nape blue; wings grey with eye-like spots; tail wedged, the colour of the wings, the two middle feathers three feet long, with large eye-spots at the shaft; feet armed. Inhabits Chinese Tartary, and is as large as a turkey. See Nat. Hist. Pl. CLXVII.

PHASIS. *s.* In the plural *phases*. (φάσις; *phase*, Fr.) Appearance exhibited by any body: as the changes of the moon (*Creech*).

PHASIS, a river of Colchis rising in the mountains of Armenia. It is famous for the expedition of the Argonauts, who entered it, after a perilous voyage. There were on its banks a number of large birds, of which the Argonauts brought some to Greece, and which were called on that account pheasants. The Phasis was reckoned by the ancients one of the largest rivers of Asia.

PHASM. *s.* (φάσμα.) Appearance; phantom; fancied apparition (*Hammond*).

PHASMATA, in physiology, certain appearances arising from the various tinctures of the clouds by the rays of the heavenly bodies, especially the sun and moon. These are infinitely diversified by the different figures and situations of the clouds, and the appulses of the rays of light; and, together with the occasional flashings and shootings of different meteors, they have, no doubt, occasioned those prodigies of armies fighting in the air, &c. of which we have such frequent accounts in most sorts of writers. — See 2 Maccab. xi. 8. Melaneth. Meteor. 2 Shel. de Comet. ann. 1618.

PHAYLOPSIS, in botany, a genus of the class didynamia, order angiosperma. Calyx

five-cleft, the upper division larger; corol ringent, the upper lip very small and cloven; capsule one-celled, four-seeded, silique-shaped. One species, an East Indian plant.

PHEASANT, in ornithology. See PHASIANUS.

PHEASANT'S EYE, in botany. See ADONIS and DIANTHUS.

PHEASANT-POUTS. Young pheasants; for the driving and taking of which within nets, when you have found out an eye of them, place your nets cross the little paths and ways they have made, which are much like sheep tracks; and, if possible, you should find out one of their principal haunts, which may be easily known by the barrenness of the ground, their mutings, and the feathers which lie scattered about; and always take the wind with you, for it is their custom to run down the wind; place the nets hollow, loose, and circular-wise; the nether part must be fastened to the ground, and the upper side lie hollow, so that when any thing rushes in, it may fall and entangle it.

Having so fixed the net, go to the haunts, and if you find the eyes scattered, with your call draw them together, and when you find them begin to cluck and pipe to one another, then forbear calling, and take an instrument, by some called a driver; which is made of strong white wands, or osiers, such as basket-makers use, which must be set in a handle: in two or three places it must be twisted or bound about with small osiers, according to the figure. With this driver, as soon as you see the pheasants gathered together, make a great noise on the boughs and bushes about you, which will so frighten them, that they will all get close together, and run away a little distance, and stand to hearken; then make the same noise a second time, which will make them run again, and continue the same till you have driven them into your nets, for they may be driven like sheep; but if it happens that they take a contrary way, then make a croaking noise, as it were, in their faces, which will presently turn them the right way, as you would have them; but in using the driver, first observe secrecy, in keeping yourself out of their sight, for if they espy you, they will run and hide themselves in holes, under shrubs, and will not stir till night. Secondly, take time and leisure, for rashness and over-haste spoil the sport.

PHEASANT-SHOOTING. This is now the only method (as hawking is disused) by which pheasants are taken by the fair sportsman. See the article SHOOTING.

PHEASANT-TAKING; a rural diversion, performed with nets in the crowing time, which is about the end of February, and in March, before they begin to breed; but which is rather the employment of the poacher than of the fair sportsman. It is done either generally or particularly; the first is, when the whole eye, viz. the old cock and hen, with all their young ones, or pouts, as they flock or run together in thick woods or coppices, are taken; or

Phasianus.

Metacalla Sutoria.

Sailor-Bird.

P. Argus.

particularly, when none but the old, and such of the young as are of age fit for coupling, are taken; so that you cannot have any assurance with your nets to strike at more than one or two at a time; for the pheasant is of a melancholy, sullen disposition, and when once it has coupled, does not accompany in flocks as other birds.

In order to take pheasants with the greater ease, you must be acquainted with their haunts and usual breeding-places, which are in young, thick, and well-grown coppices, free from the annoyance of cattle or path-ways; for being of a very timorous nature, they esteem the strength of their covert their only safety, and do not abide or breed in open or plain fields, nor under the covert of corn fields, low shrubby bushes, or in large and tall trees.

Having found their haunts, next find their eye, or brood; and here you are to observe, that pheasants come out of the woods and coverts thrice a day, to feed in fresh pastures, green wheat, or other grain, and that is about sun-rising, about noon, and a little before sun-set. Now the course to be followed, is to go to that side of the wood where you suppose they make their sallies, and watch the places where they come out; or by searching their haunts you may see the young pouts in that season flock and run together after the hen like chickens. Again, if you go to their haunts early in the morning or late in the evening, you will hear the old cock and hen call their young ones, and the young ones answer them, and accordingly direct your path as near as you can to the place where they are, then lie down as close as possible, that you may not be discerned; but observe especially how they lodge together, the better to know how to pitch your nets with the greater advantage, both of wind, weather, and place; and take care that all be done as silently as possible, otherwise they will betake themselves to their legs, and not to their wings, unless forced to it by a close pursuit.

But the most certain way to find them out, is to have an artificial pheasant-call, in using which a person should be very expert in the imitation of their notes, and the time when, and to what purpose they use them, which calls are much the same as hens use in clucking their chickens.

The chief time for using the call is in the morning early, or about sun-set, at which time they seek their food, and then the note must be to call them to food; but though these are the best times, yet the call may be used at other times, only altering the notes for calling them together, or the like.

Having the perfect use of the call, the knowledge of their haunts, and the times to take them, choose some private place not to be discovered, and then call at first very softly, lest they should be lodged very near you, and be affrighted at your loud note; but if nothing reply, raise your note higher and higher till it be extended to the utmost compass, and if any

be within hearing they will answer in as loud a note as yours, provided it be tunable, but if otherwise it will be spoiled.

As soon as the pheasant answers, if she be at much distance, creep nearer and nearer, still calling, but not so loud; and as you advance, so will the pheasant to you, so that you will come in sight of her, either on the ground or at perch, always imitating her in her true note; then cease calling, and spread your net between the pheasant and yourself in the most convenient place you can find, making one end of the net fast to the ground, and holding the other in your hand by a long line, so that when any thing strains it, you may pull the net close together; which done, call again, and as soon as you perceive the pheasant come under your net, rise up and shew yourself, upon which being affrighted, she will spring, and become entangled in the net.

If you have various pheasants answer the call, and that from several parts of the wood, keep your first station, and as you hear them make towards you, get your nets ready, spreading them conveniently about you, viz. one pair of nets on one side and another on the other, lying close without any noise, except your call, till you have lured them under your nets, and then stand up to affright them as above, that they may be entangled in your nets.

Another way to take pheasants, and which is reckoned much better than the former, is, to be provided with a stale or decoy pheasant, a live cock, which must be secretly tied down to your net, and which by his crowing will draw others in: you must lie concealed in some bush or secret place, and when you see any pheasant come to your net, draw your line, and the net will fall on and enclose him.

To take pheasants by snares.—When you have found their passage out of the wood to their usual places of feeding, plant a little stake, with a couple of snares of horse-hair, one to lie flat on the ground for their feet, and the other about the height of their head, to take them by the neck; and if there should be more passes than one do the like to every one of them; then fetch a compass about, and when you are in a direct line with the pheasant and the snare that you have fitted, make a gentle noise to frighten them.

If by their dunging and scraping you perceive that they frequent any particular place, you may then make use of such hedge-rows as are directed to take birds with lines and bird-lime, only plant your running-lines from them of a convenient height, and still place one to lie flat to entangle their legs.

Pheasants were also formerly taken by employing trained goshawks, which mode of sporting was denominated PHEASANT-HAWKING; but the diversion has been long laid aside.

PHEBE, a deaconess of the port of Corinth, called Cenchrea. St. Paul had a particular esteem for this holy woman; and Theodoret thinks the apostle lodged at her house for some

PHE

time, while he continued in or near Corinth. It is thought she brought to Rome the epistle he wrote to the Romans, wherein she is commended and recommended in so advantageous a manner. He says (Rom. xvi. 1, 2.), "I commend unto you Phebe our sister, which is a servant of the church which is at Cenchrea; that ye receive her in the Lord, as becometh saints, and that ye assist her in whatsoever business she hath need of you; for she hath been a succourer of many, and of myself also." Some moderns have advanced a notion, that Phebe was wife to St. Paul; but none of the ancients have said any thing like it. It is thought, in quality of deaconess, she was employed by the church in some ministrations suitable to her sex and condition; as to visit and instruct the Christian women, to attend them in their sickness, and distribute alms to them.

PHEER. *s.* A companion. See **FEER** (*Spenser*).

To PHEESE. *v. a.* (perhaps to *feaze*.) To comb; to fleece; to curry (*Shakspeare*).

PHEGEUS, or **PHLEGEUS**, a priest of Bacchus, the father of Alpheisibœa, who purified Alcæon of his mother's murder, and gave him his daughter in marriage. He was afterwards put to death by the children of Alcæon by Callirhoe, because he had ordered Alcæon to be killed when he attempted to recover a collar, which he had given to his daughter.

PHEGOR, or **PEOR**, a deity worshipped at a very early period by the Midianites and Moabites, and probably by all the other tribes which then inhabited Syria. Much has been said concerning the functions of this god, and the rank which he held among the Pagan divinities (see **BAAL-PEOR**); and many conjectures have been formed concerning the origin of his name. Most of these seem to have no better foundation than the senseless dreams of the Jewish rabbis. Phegor, or Peor, is undoubtedly the same with the Hebrew word *pechor*, which signifies *aperuit*, and probably refers to the prophetic influence always attributed to the solar deity, by which he opened or discovered things to come. Accordingly we find Phegor or Peor generally joined to Baal, which was the Syrian and Chaldean name of the Sun after he became an object of worship; hence Baal-Phegor must have been the sun worshipped by some particular rites, or under some particular character.

PHELLANDRIUM. Water hemlock. In botany, a genus of the class pentandria, order digynia. Florets all fertile; the central ones less; fruit ovate, smooth, crowned with the calyx and styles. Two species, one of which is common to our own ditches, the other to the European continent. The former, *P. aquaticum*, has the ramifications of its leaves divaricate, its stalk thick, and dichotomous. It proves poisonous to horses; but whether from its own juice, or the secretion of an insect, the *curculio paraplecticus*, which feeds upon it

PHI

and breeds within its stalk, is not decided. Linnæus inclines to the last opinion.

PHENGITIS. See **AMETHYST**.

PHENICE, a port of the island of Crete, to the west of the island. St. Paul having anchored at Phenice, when he was carried to Rome (Acts xxvii. 12.), advised the ship's crew to spend the winter there, because the season was too far advanced.

PHENICIA. See **PHENICIA**.

PHEONS, in heraldry, the barbed heads of darts, arrows, or other weapons.

PHENOMENON. *s.* (φαινόμενον; *phenomene*, French: it is often written *phenomenon*, and when used as a Greek plural, *phenomena*, should always be spelt with the *æ*.) 1. Appearance; visible quality (*Burnet*). 2. Any thing that strikes by any new appearance.

PHERECRATES, a comic poet of Athens, in the age of Plato and Aristophanes. He introduced living characters on the stage, and invented a sort of verse, which from him has been called Pherecratian, consisting of the three last feet of an hexameter verse, of which the first was always a spondee, as for instance, the third verse of Horace's 1, *od. 5*.

PHERECYDES. The most celebrated of this name is a philosopher of Scyros, disciple to Pittacus. He was acquainted with the periods of the moon, and foretold eclipses with the greatest accuracy. The doctrine of the immortality of the soul was first supported by him, as also that of the metempsychosis. Pythagoras was one of his disciples, remarkable for his esteem and his attachment to his learned master. He died B. C. 515, in the 85th year of his age.

PHERES, a son of Cretheus and Tyro, who built Phæræ in Thessaly, where he reigned. —2. A son of Medea, stoned to death by the Corinthians on account of the poisonous clothes which he had given to Glauce, Creon's daughter. (*Paus*).

PHERETIMA, the wife of Battus, king of Cyrene, and the mother of Arcesilaus. After her son's death, she recovered the kingdom by means of Amasis king of Egypt, and to avenge the murder of Arcesilaus, she caused all his assassins to be crucified round the walls of Cyrene, and she cut off the breasts of their wives, and hung them up near the bodies of their husbands. It is said that she was devoured alive by worms.

PHIAL, a well known vessel made of glass, used for various purposes.

PHIAL (Leyden), is a phial of glass coated on both sides with tin-foil for a considerable way up the sides, of great use in electrical experiments. See **ELECTRICITY**.

PHIDIAS, the most famous sculptor of antiquity, was an Athenian, and a contemporary of the celebrated Pericles, who flourished in the 83d Olympiad. This wonderful artist was not only consummate in the use of his tools, but accomplished in those sciences and branches of knowledge which belong to his profession, as history, poetry, fable, geometry, optics, &c.

He first taught the Greeks to imitate nature perfectly in this way; and all his works were received with admiration. They were also incredibly numerous; for it was almost peculiar to Phidias, that he united the greatest facility with the greatest perfection. His Nemesis was ranked among his first pieces: it was carved out of a block of marble, which was found in the camp of the Persians after they were defeated in the plains of Marathon. He made an excellent statue of Minerva for the Plateaus; but the statue of this goddess in her magnificent temple at Athens, of which there are still some ruined remains, was an astonishing production of human art. Pericles, who had the care of this pompous edifice, gave orders to Phidias, whose prodigious talents he well knew, to make a statue of the goddess; and Phidias formed a figure of ivory and gold 39 feet high. Writers never speak of this illustrious monument of skill without raptures; yet what has rendered the name of the artist immortal, proved at that time his ruin. He had carved upon the shield of the goddess his own portrait and that of Pericles; and this was, by those that envied them, made a crime in Phidias. He was also charged with embezzling part of the materials which were designed for the statue. Upon this he withdrew to Elis, and revenged himself upon the ungrateful Athenians, by making for the Elians the Olympic Jupiter; a prodigy of art, and which was afterwards ranked among the seven wonders of the world. It was of ivory and gold; 60 feet high, and every way proportioned. "The majesty of the work did equal the majesty of the god (says Quintilian), and its beauty seems to have added lustre to the religion of the country." Phidias concluded his labours with this masterpiece: and the Elians, to do honour to his memory, erected, and appropriated to his descendants, an office, which consisted in keeping clean this magnificent image.

The remains of the statue of the Eleusinian Ceres were purchased by Dr. E. D. Clarke and Mr. Cripps, two travelling fellows of Jesus college, Cambridge, and after being removed at considerable labour and expence, from Greece to England, are now fixed in the public library of that university.

PHIDIPIDES, a celebrated courier, who ran from Athens to Lacedæmon, about 152 English miles in two days, to ask of the Lacedæmonians assistance against the Persians. The Athenians raised a temple to his memory.

PHIDITIA, a public entertainment at Sparta, instituted by Lycurgus the legislator, where much frugality was observed, as the word (*φιδίτις* from *φιδίμαι* *πειρο*) denotes. It was a school of temperance and sobriety, where the youth were trained to good manners and useful knowledge, by the example and the discourse of the elders.

PHILA, in mythology, one of the attributes of Venus, which distinguishes her as the mother of love, from *φιλία*, to love.

PHILADELPHIA, in antiquity, were games instituted at Sardis to celebrate the

union of Caracalla and Geta, the sons of Septimius Severus.

PHILADELPHIA, in ancient geography, a noted city of Mysia, or Lydia, at the N. foot of mount Imolus, distant about 24 miles E. of Sardis, and 72 from Smyrna. A christian church was very early established here, to which John was directed to write one of the seven epistles. See Rev. iii. 7—13. This was the last city in those parts which submitted to the Turks, after a dreadful siege of six years. The Greeks retain its ancient name, but the Turks call it Allahijah. It contains 11000 inhabitants, among whom are 2000 Christians, who have four churches, and a Greek archbishop. It is 40 miles E.S.E. of Smyrna. Lon. 28. 15 E. Lat. 38. 28 N

PHILADELPHIA, the capital of Pennsylvania, and formerly the metropolis of the United States of America. It is situate in an extensive plain, on the W. bank of the river Delaware. The length of the city from E. to W. that is, from the Delaware to the Schuylkill, upon the original plan of Mr. Penn. is 10,300 feet, and the breadth, N. and S. is 4837 feet. Not half of the plot covered by the city charter is yet built. The inhabitants, however, have not confined themselves within the original limits of the city, but have built N. and S. along the Delaware, two miles in length. The circumference of the part which is built, including Kensington on the N. and Southwark on the S. is about five miles. Market Street is 100 feet wide, and runs the whole length of the city from river to river; and, near the middle, it is intersected at right angles by Broad Street, 113 feet wide, running nearly N. and S. The other streets are 50 feet wide, except Arch Street which is 65 feet, and they intersect each other at right angles. There are four squares of eight acres each, one at each corner of the city, originally reserved for public uses, and a square of ten acres in the centre. It is governed by a mayor, has 26 places of public worship for Christians of various denominations, and a synagogue for the Jews. The statehouse is a magnificent building; on the left of which is a city court-house, and on the right a philosophical hall. Here likewise is a county court-house, a public library, and several other public buildings. A university was incorporated here in 1791; its funds partly given by the state, and partly taken from the old college. This city was visited by a malignant fever in August 1793, which, in the course of three months, carried off nearly 5000 of the inhabitants. It contained 70,000 inhabitants in 1802. It is 97 miles S.W. of New York, and 130 N.E. of Washington, the present metropolis. Lon. 75. 8 W. Lat. 39. 57 N.

PHILADELPHUS, the surname of one of the Ptolemies, king of Egypt, by Antiphrasis, because he destroyed all his brothers. (See PTOLEMÆUS, 2d.)

PHILADELPHUS. Mock-orange. *Syringa*. In botany, a genus of the class icosandria, order monogynia. Calyx four or five-parted,

superior; petals four or five; style four-cleft; capsule four or five-celled, many-seeded. Two species.

1. *P. coronarius*. White syringa. Long cultivated in the gardens of our own country, and introduced from the South of Europe. Leaves slightly toothed, rough, opposite, tasting like cucumbers.

2. *P. inodorus*. Carolina syringa. Leaves very entire; flowers large, white, inodorous: a native of North America. Both these sorts are easily propagable by layers, cuttings, or suckers.

PHILÆNI, two brothers of Carthage. When a contest arose between the Cyreneans and Carthaginians, about the extent of their territories, it was mutually agreed, that, at a stated hour, two men should depart from each city, and that whenever they met, there they should fix the boundaries of their country. The Philæni accordingly departed from Carthage, and met the Cyreneans, when they had advanced far into their territories. This produced a quarrel, and the Cyreneans supported that the Philæni had left Carthage before the appointment, and that therefore they must retire, or be buried in the sand. The Philæni refused, upon which they were overpowered by the Cyreneans, and accordingly buried in the sand. The Carthaginians, to commemorate this patriotic deed of the Philæni, raised two altars on the place where their bodies had been buried, which they called *Philænorum aræ*. These altars were on that side the boundaries of the Carthaginian dominions.

PHILANTHROPY. *s.* (φιλεω and ανθρωπος.) Love of mankind; good-nature (*Addison*).

PHILANTHUS, in the entomology of Fabricius, a tribe of the genus *vespa* or wasp. See **VESPA**.

PHILEMON, a Greek comic poet, was son to Damon, and cotemporary with Menander. Any advantage he had over this poet, was owing less to his own merit than to the intrigues of his friends. Plautus has imitated his comedy *du Marchand*. He is reported to have died laughing on seeing his ass eat figs. He was then about 97 years of age. His son, Philemon the younger, was also the author of 54 comedies, of which there are still extant some considerable fragments collected by Grotius. These clearly prove that he was not a poet of the first rank. He flourished about the year 274 before our Saviour.

PHILEMON, was a rich citizen of Colossæ in Phrygia. He was converted to the Christian faith, with Appia his wife, by Epaphras the disciple of St. Paul; for St. Paul himself did not preach at Colossæ. Coloss. ii. 1: Perhaps we should have known nothing of St. Philemon, had it not been on the account of his slave Onesimus, who having robbed him, and run away from him, came to Rome, where he found St. Paul, and was very serviceable to him. St. Paul converted him, baptized him, and sent him back to his master Philemon; to whom he wrote a letter still extant, and

which passes for a masterpiece of that kind of eloquence, natural, lively, strong, and pathetic, that was peculiar to St. Paul. See **EPISTLE**. Philemon (1, 2.) had made a church of his house, and all his domestics, as well as himself, were of the household of faith. His charity, liberality, and compassion were a sure refuge to all that were in distress. The Apostolic Constitutions say, that St. Paul made him bishop of Colossæ; but the Menææ insinuate, that he went to Gaza in Palestine, of which he was the apostle and first bishop. From thence he returned to Colossæ, where he suffered martyrdom with Appia his wife, in the time of Nero. They relate several particulars of his martyrdom, and say, that his body remained at Colossæ, where it performed several miracles.

PHILESIA, in botany, a genus of the class hexandria, order monogynia. Calyx-less; corol six-petalled; the three inner petals twice as long; stigma three-lobed; berry superior, many-seeded. One species; a shrub of the Straits of Magellan, with large, axillary, campanulate corol.

PHILESIUS, a leader of the 10,000 Greeks after the battle of Cunaxa.

PHILETÆRUS. The most celebrated of this name is an eunuch made governor of Pergamus by Lysimachus, with whom he quarrelled, and made himself master of Pergamus, where he founded a kingdom called Pergamus, B. C. 283. He reigned there for 20 years, and at his death he appointed his nephew Eumenes as his successor. (*Strab. Paus.*)

PHILETAS, a grammarian and poet of Cos, in the reign of king Philip, and of his son Alexander the Great. He was made preceptor to Ptolemy Philadelphus. The elegies and epigrams which he wrote have been greatly commended by the ancients.

PHILIBEG, is a little plaid, called also kilt, and is a sort of short petticoat reaching nearly to the knees, worn by the Scotch Highlanders. It is a modern substitute for the lower part of the plaid, being found to be less cumbersome, especially in time of action, when the Highlanders used to tuck their breechdun into their girdle. Almost all of them have a great pouch of badger and other skins, with tassels dangling before, in which they keep their tobacco and money.

PHILIP the apostle was a native of Bethsaida in Galilee. Jesus Christ having seen him, said to him, "Follow me," John i. 43, 44, &c. Philip followed him; and soon after finding Nathanael, Philip said to him, "We have found the Messiah, of whom Moses and the prophets have spoken, Jesus of Nazareth, the son of Joseph." Nathanael asked him, "Can any thing good come out of Nazareth?" To which Philip replied, "Come and see." Then he brought Nathanael to Jesus, and they went with him to the marriage of Cana in Galilee. St. Philip was called at the very beginning of our Saviour's mission; and when Jesus Christ was about to feed the 5000 that followed him (Luke vi. 13. Mat. x. 2. John vi. 5-7.), he

asked St. Philip, only to prove him, whence bread might be bought for such a multitude of people? Philip answered, that 200 pennyworth of bread would not be sufficient for every one to taste a little. Some Gentiles having a curiosity to see Jesus Christ, a little before his passion, they addressed themselves to St. Philip (John xii. 21, 22.), who mentioned it to St. Andrew, and these two to Christ. At the last supper, Philip desired our Saviour, that he would be pleased to show them the Father, being all that they desired (John xiv. 8—10.) But Jesus told them, that seeing the Son they saw the Father also. 'This is all we find concerning Philip in the gospel.

PHILIP, the second of the seven deacons, was chosen by the apostles after our Saviour's resurrection. (Acts vi. 5.) This deacon, they say, was of Cæsarea in Palestine. It is certain that his daughters lived in this city. (Acts xxi. 8, 9.) After the death of St. Stephen, all the Christians, excepting the apostles, having left Jerusalem, and being dispersed in several places, St. Philip went to preach at Samaria (id. viii. 1, 2, &c.), where he performed several miracles, and converted many persons. He baptized them; but, being only a deacon, he could not confer on them the Holy Ghost. Wherefore, having made known to the apostles at Jerusalem, that Samaria had received the word of God, Peter and John came thither, and the Samaritans that were converted received the Holy Ghost. St. Philip was probably at Samaria when the angel of the Lord ordered him to go to the south part of the country, in the road that leads from Jerusalem to old Gaza. Philip obeyed, and there met with an Ethiopian eunuch belonging to queen Candace, who had the care of her revenues, and had been at Jerusalem to worship God there (id. viii. 26, 27, &c.) He was then returning into his own country, and was reading the prophet Isaiah as he went along in his chariot. Philip, hearing the eunuch reading the prophet Isaiah, said to him, Do you understand what you read? The eunuch replied, How should I understand, except somebody explain it to me? He desired Philip therefore to come and sit down by him in the chariot. The passage the eunuch was reading is this, "He was led as a sheep to the slaughter, and like a lamb dumb before his shearer, so he opened not his mouth." The eunuch then says to Philip, pray, whom does the prophet speak of in this place? Is it of himself, or of some other? Then Philip began to instruct him concerning Jesus Christ. And having gone on together, they came to a fountain; when the eunuch said to Philip, Here is water, what hinders me from being baptized? Philip told him that he might be so, if he believed with all his heart. He replied, I believe that Jesus Christ is the Son of God. He then ordered the chariot to stop, and they both alighted and went down into the water; where Philip baptized the eunuch. Being come out of the water, the Spirit of the Lord took away Philip, and the eunuch saw no more of him. But Philip was found again at Azotus, and he

preached the gospel in all the cities he passed through, till he arrived at Cæsarea in Palestine. After this, the scripture does not inform us of any particulars relating to Philip. The modern Greeks say that he went to Tralles in Asia, where he founded a church, of which he was the apostle and bishop; and where he rested in peace, after performing many miracles. The Latins, on the contrary, say that he died at Cæsarea, and that three of his daughters were there buried with him.

It is thought, that the eunuch converted by St. Philip was the first apostle of the Ethiopians; and that the Abyssines boast of having received the Christian faith from him.

PHILIP I. son of Argeus, succeeded his father on the throne of Macedonia, and reigned 38 years B. C. 40.

PHILIP II. was the fourth son of Amyntas, king of Macedonia. He was sent to Thebes as an hostage by his father, where he learnt the art of war under Epaminondas, and studied the manners of the Greeks. He was recalled to Macedonia, and at the death of his brother Perdiccas he ascended the throne as guardian of his nephew, but he soon made himself independent. The neighbouring nations ridiculing his youth appeared in arms. Unable to meet them as yet in the field, he suspended their fury by presents, and soon turned his arms against Amphipolis, tributary to the Athenians, which he conquered, and added to the kingdom of Macedonia. He next meditated the destruction of Athens. His designs, however, were as yet immature, and before he could attempt this, the Thracians and the Illyrians demanded his attention. He made himself master of a Thracian colony, from the gold mines of which he received the greatest advantages. He married Olympias the daughter of Neoptolemus, king of the Molossi, by whom he had Alexander the Great. Every thing seemed now to conspire to his aggrandizement, and Philip received in one day the intelligence of the birth of a son, an honourable crown at the Olympic games, and a victory over the barbarians of Illyricum. He next laid siege to Olynthus, to the assistance of which the Athenians, roused by the eloquence of Demosthenes, sent 17 vessels and 2,000 men. This increased rather than satiated his ambition: he declared his inimical sentiments against the power of Athens and the independence of all Greece, by laying this siege against a place, which, on account of its situation and consequence, would prove most injurious to the interests of the Athenians, and most advantageous to the intrigues and military operations of every Macedonian; but the money of Philip prevailed over all their efforts. The greatest part of the citizens suffered themselves to be bribed by Macedonian gold, and Olynthus having surrendered, was instantly reduced to ruins. His successes were as great in every part of Greece. In his attempts, however, to make himself master of Eubœa, Philip was unsuccessful, and Phocion, who despised his gold as well as his

meanness, obliged him to evacuate that island. From Eubœa he turned his arms against the Scythians, but the advantages he obtained over this indigent nation were inconsiderable, and he again made Greece an object of plunder. He advanced far in Boeotia, and a general engagement was fought at Chæronea. The fight was long and bloody, but Philip obtained the victory. At the battle of Chæronea the independence of Greece was extinguished, and Philip, unable to find new enemies in Europe, meditated new conquests. He was nominated general of the Greeks against the Persians, whose invasions of Greece under Darius and Xerxes he had resolved to avenge. But he was stopped in the midst of his warlike preparations; Pausanias, as he entered the theatre at the celebration of the nuptials of his daughter Cleopatra, stabbed him, it is supposed, at the instigation of his wife Olympias. The ridiculous honours which Olympias paid to her husband's murderer, however, strengthened the suspicion. The character of Philip is that of a sagacious, artful, prudent, and intriguing monarch. He possessed much perseverance, and in the execution of his plans he was always vigorous. The private character of Philip lies open to censure, and raises indignation. He was murdered in the 47th year of his age, and the 24th of his reign, about 336 years B. C. He is the first monarch whose life and actions are described with peculiar accuracy and historical faithfulness. Philip was the father of Alexander the Great, and of Cleopatra, by Olympias; he had also by Audaca, an Illyrian, Cyna, who married Amyntas the son of Perdiccas, Philip's elder brother; by Nicaspolis, a Thessalian, Nicæa, who married Cassander; by Philinna, a Larissæan dancer, Aridæus, who reigned some time after Alexander's death; by Cleopatra, the niece of Attalus, Caranus and Europa, who were both murdered by Olympias; and Ptolemy, the first king of Egypt, by Arsinoë.—The last king of Macedonia, of that name, was son of Demetrius. Not satisfied with the kingdom of Macedonia, Philip aspired to become the friend of Annibal, and wished to share with him the spoils of Rome. The Romans, however, discovered his intrigues, and though much weakened by the Carthaginians, yet they were soon enabled to meet him in the field of battle. The consul Lævinus entered without delay his territories of Macedonia, and after he had obtained a victory over him near Apollonia, and reduced his fleet to ashes, he compelled him to sue for peace. This peaceful disposition was not permanent, and he again assisted Annibal with men and money. The Romans then appointed T. Q. Flaminius to punish his perfidy, and the Roman consul with great expedition invaded Macedonia, and in a general engagement fought near Cynocephale, Philip being totally defeated, saved his life with difficulty by flying from the field of battle. Destitute of resources, he then was obliged to submit to the mercy of the conqueror, and to demand peace by his ambassadors, which was granted upon terms

disadvantageous and degrading to his dignity. In the midst of these public calamities, the peace of his family was disturbed by Perseus, the eldest of his sons, by a concubine, at whose instigation he put to death his son Demetrius. Having discovered the perfidy of Perseus, he attempted to make Antigonus, another son, his successor, but he was prevented from executing his purpose by death, in the 42d year of his reign, 179 years before the Christian era.

PHILIP, duke of Suabia, and son of Frederick Barbarossa, was elected emperor on the death of his brother Henry VI. in 1198. Another party of the electors, however, chose Otho, duke of Saxony, in opposition to him, which occasioned a civil war in Germany. In 1200 the pope declared himself in favour of Otho, and excommunicated Philip. In 1206 the pope absolved him, and endeavoured to bring about a reconciliation between the two rivals, but in vain, and Philip was assassinated at Bamberg in 1208, aged 34. (*Watkins*).

PHILIP I. king of France, succeeded his father in 1060, at the age of 8 years, under the regency of Baldwin V. count of Flanders, who acquitted himself in this important office with honour. Philip divorced his wife Bertha, and married Bertrade, the wife of the count of Anjou, for which he was excommunicated by the council of Poitiers, in 1100. He died at Milan in 1108.

PHILIP II. surnamed the August, born 1165, was crowned on the death of his father Lewis VII. in 1180. He went to the holy land with Richard I. king of England, and the two monarchs took Acre, a place of considerable consequence. A difference breaking out between the kings, Philip returned to his own country; and not long afterwards he turned his arms against the English, from whom he took some places in Normandy, although he had bound himself by oath not to do any thing against Richard in his absence. Philip married the princess of Denmark, whom he divorced, and espoused the daughter of a nobleman, for which the pope excommunicated him, but the sentence was afterwards taken off on his promise to take back his former wife. He maintained the cause of Arthur against his uncle John, king of England, and a long war ensued between the two countries. The pope took part with John, because he declared himself a vassal of the holy chair. Some of the English nobility, tired of his conduct, offered the crown to Philip, but he only sent them his son Lewis, who was crowned at London in 1216, and soon after excommunicated at Rome. On the death of John, the English acknowledged his son Henry III. and forced Lewis to quit the kingdom. Philip died in 1223.

PHILIP III. surnamed the Hardy, was proclaimed king of France, in Africa, on the death of St. Lewis his father, in 1270. He obtained a victory over the infidels, and having made peace with the king of Tunis, returned to France. He marched against Peter of Ar-

ragon, to punish that monarch for the inhuman massacre commonly called the Sicilian Vespers, and died of a malignant disorder in the expedition at Perpignan, in 1285, in the 40th year of his age. In his reign the first letters of nobility were given.

PHILIP IV. born in 1268, succeeded his father Philip III. in 1285. He entered into a war with Edward I. king of England, which was not of long duration. He had a long contest with pope Boniface VIII. respecting his right to present to benefices. The pope thundered his bulls of excommunication against him, in which he maintained that the temporal powers were subject to the spiritual, and that he had a right to depose sovereigns. Philip, however, resisted his pretensions, and the succeeding pontiffs annulled the proceedings of Boniface. This prince distinguished himself by persecuting the order of knight's templars, and died in 1314.

PHILIP V. surnamed the Long, succeeded Lewis Hutin, his brother, in 1316. He made war against the Flemings, renewed an alliance with the Scotch, drove the Jews from his kingdom, and died in 1322, aged 28. (*Watkins*).

PHILIP DE VALOIS, first king of France, of the branch of the Valois, ascended the throne on the death of Charles the Fair, 1328. His elevation was disputed by Edward III. of England, and a terrible war was kindled between the two nations. Edward invaded the country, and victory marked his steps. His fleet defeated the French ships in 1340, and in 1346 the battle of Cressy was fought, in which France lost nearly 30,000 men. The loss of Calais, and other important places, were the rewards of this signal victory. Philip died 1350, aged 57.

PHILIP I. son of the emperor Maximilian, obtained the Spanish crown. He was of moderate abilities, but regarded as the fairest man of his age. He died at Burgos 1506, aged 28.

PHILIP II. son of Charles V. was king of Naples and Sicily, in 1554, on his father's abdication, and king of England by marriage with queen Mary, and two years after he ascended the Spanish throne by the resignation of his father. He obtained the famous victory of St. Quintin in 1557, during which, it is said, he was so terrified, that he made two vows; the one never again to appear in a fight, and the next, to erect a monastery to St. Lawrence, to whose powerful influence he ascribed the success of his arms. This victory, which might have made him master of France, was followed by the capture of only a few little towns; so that Charles, on hearing of the battle, asked if his son were at Paris, and being answered in the negative, turned his back with contempt on the messenger. Sanguinary in his conduct, and violent in his measures, Philip alienated the affections of the Flemings, who, harassed by his oppressions, threw off the yoke. In vain Alva, by valour and severity, attempted to restore subordina-

tion; seven provinces were severed from the Spanish yoke, and under the name of United Provinces, established their independence. Philip subdued Portugal to his power, and formed plans for the subjection of England, which the death of Mary had placed under the administration of Elizabeth. In 1558 the invincible armada sailed from Lisbon, for the conquest of England; but the storms and the valour of the English were enemies which the ambitious monarch was not prepared to encounter. The fleet was dispersed and cut to pieces, and when Philip heard of the loss of his 100 ships, and of 20,000 of his men, he replied with great resignation, I had sent my fleet against the English, and not against the winds; the Lord's will be done. He died 1590, aged 72. Though represented by some, ferocious and unprincipled as Tiberius, and by others, wise and discreet as Solomon, Philip may be considered as a man of great abilities, too much, indeed, guided by superstition, and too strongly influenced by family pride, and the love of universal dominion, yet, endowed with sagacity, able and eager to distinguish merit, and during a long reign, if not the first man, yet the chief personage in Europe.

PHILIP III. son of Philip II. succeeded to the Spanish throne at the age of 20. He made himself master of Ostend by his general Spinola, after a siege of three years, and the loss of 80,000 men; but by making peace with his enemies, he established the house of Nassau in the possession of the rebellious provinces of Holland. Philip issued a decree for the banishment of his Moorish subjects in 30 days, and thus robbed his kingdom of the arts, the knowledge, and the laborious services of above a million of men. He died soon after, a victim to court etiquette. While in the council, he complained of the disagreeable smell of the brazier which warmed the room; but as the officer who took care of the fire was absent, no one ventured to remove the offensive utensil, and in consequence the king was taken ill and soon after died, 1621, aged 43.

PHILIP IV. son of Philip III. was king of Spain, 1621. The war with Holland was renewed, and in 1635 Philip increased the number of his enemies, by declaring against France; but though at first victorious, his troops were defeated. The Catalonians also rebelled under the patronage of France, and Portugal shook off the yoke, and re-established her monarch under the auspicious government of the house of Braganza, 1640. These losses, occasioned by the negligence of his minister Olivares, instead of rousing the nation, were received with indifference. Olivares was indeed disgraced; but the war was concluded by a dishonourable treaty, which separated Roussillon, Artois, and Alsace, from the Spanish crown, 1659, and soon after Philip acknowledged the independence of Portugal. He died 1665, aged 60.

PHILIP V. duke of Anjou, ascended the Spanish throne 1700, agreeable to the will of

the last monarch Charles II. Though well received at Madrid, his elevation was opposed by Charles of Austria, supported by the emperor, by England, Holland, Savoy, Prussia, and Portugal. The new king lost Arragon, Gibraltar, the Belears, Sardinia, and Naples, and quitted his capital: but while he thought of flying to America, he received assistance from France, under the duke of Vendome, and in the battle of Villa Viciosa, in 1710, he recovered his losses, and was firmly fixed on his throne by the treaty of Utrecht, in 1713. Under the administration of Alberoni, Philip by degrees made himself master of Majorca, Minorca, Sardinia, and Palermo, but in 1717 his fleet was defeated in the Mediterranean by Byng. Philip soon after became a prey to superstitious fears, and resigned his crown, in 1724, in favour of his son Louis, and retired to a monastery. The sudden death of the new monarch, a few months after, of the smallpox, left the kingdom without a master, and Philip again resumed the reins of government. In 1733 he joined France, against the emperor, and saw his son Don Carlos, with an army of 30,000 men, conquer Sicily and Naples, and establish himself on the throne. He died 1746, aged 63, after a reign of 45 years. (*Lempriere*).

PHILIP ISLANDS, two islands in the Pacific ocean, discovered by captain Hunter in 1791. They are five miles asunder, but almost joined by a sandy spit, which reaches, for about two thirds of the distance, from the easternmost island to the most westerly, which last is the smallest. They are covered with shrubs, have few tall trees on them, and the land is low. Lon. of the eastern island 140. 3 E. Lat. 8. 6 S.

PHILIPPOPOL, a city of European Turkey, in Romania, and an archbishop's see. It is of considerable size, but meanly built, and chiefly inhabited by Greeks. It stands on the Marissa, 50 miles N.W. of Adrianople. Lon. 24. 50 E. Lat. 42. 25 N.

PHILIPPEVILLE, a fortified town of France, in the department of Ardennes. It was anciently called Corbigny, and received its present name in honour of Philip II. of Spain. It is 16 miles N. of Rocroy.

PHILIPPEI or **PHILIPPI**, certain pieces of money coined in the reign of Philip of Macedonia, and with his image.

PHILIPPI, a town of Macedonia, anciently called Dato, situate at the E. of the river Strymon. It was called Philippi, after Philip, king of Macedonia, and became celebrated for two battles fought there in October, B. C. 42, at the interval of about 20 days, between Augustus and Antony, and the republican forces of Brutus and Cassius, in which the former obtained the victory.

The city of Philippi is likewise remarkable on account of an epistle written by St. Paul to the church in that place. It was a Roman colony. It is also remarkable for being the birth-place of Adrastus, the Peripatetic philosopher, and dis-

ciple of Aristotle. The town is still in being, and is an archbishop's see; but greatly decayed and badly peopled. However, there is an old amphitheatre, and several other monuments of its ancient grandeur. Lon. 44. 55 E. Lat. 41. 0 N.

PHILIPPIANS (Epistle of Paul to the), a canonical epistle of the New Testament, is generally agreed to have been written by St. Paul in the second year of his imprisonment at Rome, about A. D. 62.

The christian church was first planted at Philippi about the year of our Lord 51, by St. Paul; who, having made a progress through Galatia and Phrygia (Acts xvi.) and intending to pursue his tour through Bithynia, was admonished by the Spirit to go over to Macedonia. Being arrived at Philippi, he, with Timothy, Luke, and Silas, spent some days there in preaching the gospel. Though the apostle soon after left the city, Luke and Timothy continued there some time longer to carry on the work; and this was one reason why he fixed on the latter to visit the Philippians in his absence (Philip. ii. 19—22.) It appears from Acts xx. 6, that St. Paul made the Philippians a second visit.

This Epistle, which is quite of the practical kind, seems to be designed to comfort the Philippians, under the concern they had expressed at the news of his imprisonment; to check a party spirit, that appears to have broken out among them, and to promote on the contrary an entire union and harmony of affection; to guard them against being seduced from the purity of the christian faith by Judaizing teachers; to support them under the trials with which they struggled; and above all, to inspire them with a concern to adorn their profession by the most exalted attainments in the divine life.

PHILIPPICS. (*φιλιππικαι λογοι*.) In literature, is a name which is given to the orations of Demosthenes against Philip king of Macedon. The Philippics are reckoned the master-pieces of that great orator: Longinus quotes many instances of the sublime from them; and points out a thousand latent beauties. Indeed, that pathetic in which Demosthenes excelled, the frequent interrogations and apostrophes wherewith he attacked the indolence of the Athenians, where could they be better employed? Whatever delicacy there be in the oration against Leptines, the Philippics have the advantage over it, were it only on account of the subject, which gives Demosthenes so fair a field to display his chief talent, we mean, with Longinus, that of moving and astonishing.

PHILIPPIC is likewise applied to the fourteen orations of Cicero against Mark Antony. Cicero himself gave them this title in his epistles to Brutus; and posterity have found it so just, that it has been continued to our times. Juvenal, Sat. x. calls the second the divine Philippic, and witnesses it to be of great fame, *conspicua divina Philippica fama*.

That orator's entitling his last and most valued orations after the *Philippics* of Demosthenes shows the high opinion he had of them. Cicero's *Philippics* cost him his life; Mark Antony having been so irritated with them, that, when he arrived at the triumvirate, he procured Cicero's murder, cut off his head, and stuck it up in the very place whence the orator had delivered the *Philippics*.

PHILIPPINE, a strong town of the Netherlands, in Flanders. It was taken by the French in 1747, restored in 1748, and again taken in 1794. It is seated on an arm of the Scheldt, 15 miles N. by W. of Ghent.

PHILIPPINE ISLANDS, a large group of islands in the N. Pacific ocean, discovered by Magellan, in 1521, and afterward conquered by the Spaniards, in the reign of Philip II. They lie 400 miles S.E. of China, and are said to be 1100 in number, but some hundreds of them are very small. The principal are, Luconia, Mindanao, Paragoa, Samar, Masbate, Mindoro, Luban, Panay, Leyta, Bohol, Zebu, Negros, St. John, and Abyo. This extensive group presents many volcanic appearances, and is subject to violent earthquakes, thunder, and rains. The air is hot and moist; and the soil is fertile in rice, bread-fruit, and many other useful vegetables and fruits. The cotton is of peculiar beauty, and the sugarcane and cocoa-nut trees are objects of particular culture. The trees are always green, and there are ripe fruits all the year. There are a great many wild beasts and birds, quite unknown in Europe; also many noxious and venomous creatures, and even herbs and flowers, that are poisonous. Gold, copper, and iron are among the certain products. The natives are not all of one original; they are affable, hospitable, and honest, and cultivate the land with abundant skill. The principal tribe are called Tagals, and seem of Malay origin. They are tall and well made, of a tawny complexion, and wear only a kind of shirt and loose drawers; but the dress of the women is chiefly a large mantle, and their black and beautiful hair is of great length. The houses are of bamboo covered with palm leaves, raised on pillars to the height of nine feet. The chief food is rice, cocoa-nut, and salted fish. See **LUCONIA**.

PHILIPPINES, a religious society of young women at Rome, so called from their taking St. Philip de Neri for their protector. The society consists of 100 poor girls, who are brought up till they are of age to be married, or become nuns, under the direction of some religious women, who teach them to read, write, and work, and instruct them in the duties of Christianity. They wear a white veil, and a black cross on their breast. See **MACEDONIA**.

PHILIPPISTS, a sect or party among the Lutherans; the followers of Philip Melancthon. He had strenuously opposed the Ubiquists, who arose in his time; and the dispute growing still hotter after his death, the univer-

sity of Wittemberg, who espoused Melancthon's opinion, were called by the Flacians, who attacked it, *Philippists*.

PHILIPPUS (M. Julius), a Roman emperor of an obscure family in Arabia, whence he was surnamed Arabian. From the lowest rank in the army, he gradually rose to the highest offices, and made general of the pretorian guards. He assassinated Gordian to make himself emperor. To establish himself with more certainty on the imperial throne, he left Mesopotamia a prey to the invasions of the Persians, and hurried to Rome, where his election was universally approved by the senate and the Roman people. Philip rendered his cause popular by his liberality and profusion. His usurpation, however, was short; Philip was defeated by Decius, who had proclaimed himself emperor in Pannonia, and he was assassinated by his own soldiers near Verona, in the 45th year of his age, and the 5th of his reign, A.D. 249. His son, who bore the same name, and who had shared with him the imperial dignity, was also massacred in the arms of his mother. Young Philip was then in the 12th year of his age.

PHILIPS (Thomas), of Ickford, Bucks, was educated at St. Omer's, among the jesuits, whose order he quitted. He was promoted to a prebend in Tongres cathedral, and died at Liege, 1774, aged 66. He published a letter to a student in divinity, 8vo. a performance of merit—the life of cardinal Pole, 2 vols. 4to. a work of celebrity.

PHILIPS (Fabian), a learned antiquary, born at Prestbury, Gloucestershire, 1601. He studied in the inns of court in London, and supported the king's prerogative, as filazer of the records of London, Middlesex, &c. He protested against the beheading of Charles I. and posted up his sentiments in the most public places of the city. He wrote various pamphlets, and died 1690.

PHILIPS (Catherine), daughter of Mr. Fowler, a London merchant, married, at the age of 16, James Philips of Cardigan, esq. and died of the small-pox 1664, aged 33. She translated Corneille's *Pompey*—and also the four first acts of his *Horace*, besides various poems under the name of Orinda. Her poetical talents were celebrated by the learned men of her age, by lords Orrery, Roscommon, and by Cowley and others.

PHILIPS (John), an English poet, born at Bampton, Oxfordshire. He was educated at Winchester school, and Christ church, Oxford. His first poem was the *Splendid Shilling*, an excellent composition, which describes the most trivial things in the lofty language of Milton. *Blenheim* was the next effusion of his muse, and the *Cyder*, a happy imitation of Virgil's *Georgics*, appeared 1705. He wrote besides a Latin ode to his patron St. John, and it has been remarked, that such was his addiction to tobacco, that he has introduced the praises of it in all his pieces except *Blenheim*. This excellent poet, whose character in pri-

vate life was amiable, died of a consumption and asthma at Hereford, 15th February 1708, aged 32.

PHILIPS (Ambrose), an English poet, educated at St. John's college, Cambridge. While at college he wrote his Pastorals, a species of poetry in which he is said to have excelled, though Pope ridiculed them, and to render his satire more poignant, introduced into the *Guardian* a paper which in a delicate strain of irony compared the pastorals of the two rivals, and gave in an affected manner the superiority to Philips. Philips resented the attack, and unable to revenge himself by his pen, he stuck up a rod at Button's coffee-house, and threatened to chastise his antagonist wherever he saw him. In his circumstances he was very independent, and as the friend of the Hanoverian succession he was made a justice of the peace, and in 1717 appointed one of the lottery commissioners. He was in 1734 registrar of Dublin prerogative court, and he sat in the parliament of Ireland for Armagh. He returned in 1748 to England to live on an annuity of 400*l.* but a stroke of the palsy carried him off, 18th June, 1749, aged 78. He wrote three dramatic pieces of some merit, the *Distressed Mother*—the *Briton*—and *Humphrey, duke of Gloucester*—beside his *Life of Archbishop Williams*, and a little poem called a *Winter Piece*, which Pope condescended to commend, though he ridiculed all his other works. Dr. Johnson says he was eminent for bravery, and in conversation solemn and pompous.

PHILIPS NORTON, a town of Somersetshire, with a market on Thursday, seven miles S. by E. of Bath, and 104 W. of London.

PHILIPSBURG, a town of New Jersey, in Sussex county, situate on the river Delaware, opposite Easton in Pennsylvania, 41 miles N.W. of Trenton.

PHILIPSBURG, a town of New York, in Dutchess county, near which is a mine that yields virgin silver. It stands on the E. side of Hudson river, 28 miles N. by E. of New York.

PHILISTÆ (anc. geog.), the country of the Philistines (Bible); which lay along the Mediterranean, from Joppa to the boundary of Egypt, and extending to inland places not far from the coast. *Palæstini*, the people; *Palæstina*, the country (Josephus): Afterwards applied to the whole of the Holy Land and its inhabitants. *Philistæi*, the people (Septuagint); *Philistini* (Vulgate); the *Caphtorim* and *Philistim*, originally from Egypt, and descendants of Cham (Moses). Expelled and destroyed the Hivites, the ancient inhabitants, and occupied their country; that is, the region which retained the name of *Philistim*, in which that of *Caphtorim* was swallowed up.

PHILISTINES, were the ancient inhabitants of Palestine, well known in sacred history. These people are sometimes called in Scripture *Cherethites* and *Caphtorims*. The earlier part of their history is, like that of

most other nations, very obscure and uncertain. The authors of the *Universal History* tell us, that they were descended from the *Casluhim* partly, and partly from the *Caphtorim*, both from the loins of *Mizraim* the son of Ham, the son of Noah. Moses tells us (*Deut. xi. 23.*), that they drove out the *Avim* or *Avites* even to *Azzah* or *Gazah*, where they settled; but when this happened cannot be determined. On the whole, however, our learned authors are clearly of opinion, that the *Casluhim* and *Caphtorim*, from whom the *Philistines* are descended, came originally from Egypt, and called the country which they had conquered by their own name. (See **PALESTINE**.) Many interpreters, however, think, that *Caphtor* was but another name for *Cappadocia*, which they imagine to have been the original country of the *Philistines*. But father Calmet, in a particular dissertation prefixed to the first book of *Samuel*, endeavours to show that they were originally of the isle of *Crete*.

PHILLO, in antiquity, an Arcadian maid, by whom *Hercules* had a son. The father exposed his daughter, but she was saved by means of her lover, who was directed to the place where she was doomed to perish, by the chirping of a magpie, which imitated the plaintive cries of a child.

PHILLYDRUM, in botany, a genus of the class *monandria*, order *monogynia*. *Spathes* one-flowered; calyxless; corol four-petalled, irregular; capsule three-celled, many-seeded. One species; an herbaceous plant of China and *Cochinchina*, with spongy, woolly stem, and golden, peduncled flowers, supported by short pointed, hairy spathes.

PHILLYREA. Mock-privet. In botany, a genus of the class *diandria*, order *monogynia*. Corol four-cleft; berry two-celled, one-seeded. Three species, as follow:

1. *P. media*. Lance-leaved *phillyrea*. An ever-green shrub, with opposite leaves; white, axillary flowers in bunches; varying in the shape of its leaves. South of Europe.

2. *P. angustifolia*. Narrow-leaved *phillyrea*. Linear, very entire leaves, opposite branches; white axillary clustered flowers; small berries. A native of Spain and Italy.

3. *P. latifolia*. Broad-leaved *phillyrea*. Leaves ovate heart-shaped; white axillary clustered flowers.

These shrubs are hardy enough to thrive in the open air of our own climate; and never lose their leaves but in very severe winters, being soon however renewed on the return of summer.

PHILO, an ancient Greek writer, was of a noble family among the Jews, and flourished at Alexandria during the reign of *Caligula*. He was the chief of an embassy sent to Rome about the year 42, to plead the cause of the Jews against *Apion*, who was sent by the Alexandrians to charge them with neglecting the honours due to *Cæsar*. *Caligula*, however, would not allow him to speak, and behaved to him in such a manner that *Philo* was

in considerable danger of losing his life. Others again tell us that he was heard; but that his demands were refused. He afterwards went to Rome in the reign of Claudius; and then, Eusebius and Jerome inform us, he became acquainted with St. Peter, with whom he was on terms of friendship. Photius adds, that he became a Christian, and afterwards, from some motive of resentment, renounced it. Great part of this, however, is uncertain; for few believe that St. Peter was at Rome so early as the reign of Claudius, if he ever was there at all.

Philo was educated at Alexandria, and made very great progress in eloquence and philosophy. After the fashion of the time, he cultivated, like many of his nation and faith, the philosophy of Plato, whose principles he so thoroughly imbibed, and whose manner he so well imitated, that it became a common saying, *Aut Plato philonizat, aut Philo platonizat*. Josephus says, he was a man "eminent on all accounts;" and Eusebius describes him, "copious in speech, rich in sentiments, and sublime in the knowledge of holy writ." He was, however, so much immersed in philosophy, particularly the Platonic, that he neglected the Hebrew language, and the rites and customs of his own people. Scaliger says, that Philo "knew no more of Hebrew and Syriac than a Gaul or a Scythian." Grotius is of opinion, that "he is not fully to be depended on, in what relates to the manners of the Hebrews;" and Cudworth goes further; for, "though a Jew by nation (says he), he was yet very ignorant of Jewish customs." Fabricius thinks differently; for, though he allows some inadvertencies and errors of Philo with regard to these matters, yet he does not see a sufficient foundation on which to charge so illustrious a doctor of the law with ignorance. He allows, however, that Philo's passion for philosophy had made him more than half a Pagan; for it led him to interpret the whole law and the prophets upon Platonic ideas; and to admit nothing as truly interpreted which was not agreeable to the principles of the academy. Besides, this led him farther; he turned every thing into allegory, and deduced the darkest meanings from the plainest words. Philo's writings abound with high and mystical, new and subtle, far-fetched and abstracted notions; and indeed the doctrines of Plato and Moses are so promiscuously blended, that it is not an easy matter to assign to each his principles. There are certainly, however, in his works many excellent things. Though he is continually platonising and allegorising the Scriptures, he abounds with fine sentiments and lessons of morality, and his morals are rather the morals of a Christian than of a Jew. History, together with his own writings, give us every reason to believe that he was a man of great prudence, constancy, and virtue.

His works were first published in Greek by Turnebus, at Paris, 1552. A Latin translation made by Gelenius was afterwards added, and printed several times with it. The Paris edi-

tion of 1640, in folio, was the best for a whole century; which made Cotelierius say, that "Philo was an author that deserved to have a better text and a better version." In 1742, a handsome edition of his work was published at London by Dr. Mangey, in two volumes, folio; there is also an edition in 5 vols. 8vo. published A.D. 1785—1792.

PHILO of Byblos, a grammarian of the first century, who acquired celebrity by his works, the chief of which is the Phœnician history of Sanconiathon, translated into Greek, some fragments of which remain.

PHILO of Byzantium, an architect, who flourished 300 B. C. He wrote a treatise of machines used in war, which is extant in the *Mathematici veteres*, 1693, folio. There is also attributed to him another piece, entitled, *De septem Orbis Spectaculis*, Rome, 1640, but on no just grounds.

PHILOCTES, one of the admirals of the Athenian fleet, during the Peloponnesian war. He recommended to cut off the right hand of such of the enemies as were taken. His plan was adopted by all the ten admirals except one, but instead of being conquerors, they were totally defeated at Ægospotamus by Lysander, and Philoctes was put to death with the rest of his colleagues.

PHILOCTETES, in fabulous history, son of Pœan and Demonassa, was one of the Argonauts according to Hyginus, and the arm-bearer and particular friend of Hercules. He erected the pile on which the hero was consumed, and received from him his arrows, dipped in the gall of the hydra. He had no sooner paid the last offices to Hercules, than he returned to Melibœa, where his father reigned. He then visited Sparta, where he became one of the suitors of Helen, and soon after accompanied the Greeks to the Trojan war, with seven ships. He was prevented from joining his countrymen at Aulis, on account of the offensive smell which arose from a wound in his foot, and at the instigation of Ulysses, he was carried to the island of Lemnos. In this retreat he remained for some time, till the Greeks, on the tenth year of the Trojan war, were informed by the oracle, that Troy could not be taken without the arrows of Hercules, then in the possession of Philoctetes. Upon this, Ulysses, accompanied by Diomedes, went to Lemnos, to prevail upon Philoctetes to come and finish the siege. Philoctetes refused to go to Troy, and was about to return to Melibœa, when the manes of Hercules immediately ordered him to repair to the Grecian camp, where he should be cured of his wounds, and put an end to the war. Philoctetes obeyed, and being restored to health by Æsculapius, he destroyed an immense number of the Trojans, among whom was Paris. When Troy had been ruined, he set sail from Asia, but as he was unwilling to visit his native country, he came to Italy, where he built a town in Calabria, which he called Petilia. The sufferings and adventures of Philoctetes are

the subject of one of the best tragedies of Sophocles.

PHILODEMUS, a poet in the age of Cicero, who rendered himself known by his lascivious and indelicate verses.

PHILOLAUS, of Crotona, was a celebrated philosopher of antiquity, of the school of Pythagoras, to whom that philosopher's Golden Verses have been ascribed. He made the heavens his principal object of contemplation; and has been idly supposed to have been the author of that true system of the world which Copernicus afterwards revived. This made Bullialdus place the name of Philolaus at the head of two works written to illustrate and confirm that system.

"He was," says Dr. Enfield, "a disciple of Archytas, and flourished in the time of Plato. It was from him that Plato purchased the written records of the Pythagorean system, contrary to an express oath taken by the society of Pythagoreans, pledging themselves to keep secret the mysteries of their sect. It is probable, that among these books were the writings of Timæus, upon which Plato formed the dialogue which bore his name. Plutarch relates, that Philolaus was one of the persons who escaped from the house that was burned by Cylon during the life of Pythagoras; but this account cannot be correct. Philolaus was contemporary with Plato, and therefore certainly not with Pythagoras. Interfering in affairs of state, he fell a sacrifice to political jealousy."

PHILOLOGER. *s.* (φιλόλογος.) One whose chief study is language; a grammarian; a critic (*Sprab*).

PHILOLOGICAL. *a.* (from *philology*.) Critical; grammatical (*Watts*).

PHILOLOGIST. *s.* (See **PHILOLOGER**.) A critic; a grammarian.

PHILOLOGY, a term under which some comprehend universal literature, so that each one may there include whatever he thinks proper; as grammar, rhetoric, poetry, antiquities, history, criticism, the interpretation of authors, &c. This seems to be not only making an abuse of words, but creating confusion in those matters where too much regularity and precision cannot be observed. The term philology is composed of the Greek words *φιλος* and *λογος*, which imply a love or study of languages. It appears, therefore, that philology is nothing more than a general knowledge of languages, of the natural and figurative signification of their words and phrases, and, in short, of all that relates to expression in the different dialects of nations, as well ancient as modern.

Languages, in general, may be divided into,

1. Ancient languages; which are those that have become extinct with the people who spoke them, or have been so altered and disfigured, that they no longer resemble the languages which were spoken by those people.

2. Oriental languages; the study of which is necessary in order to the understanding of the text of the holy scriptures, especially the Old Testament.

3. Learned languages; which are those that are indispensably necessary in the study of erudition, and particularly literature; which, while there were people in the world who made them their common language, were called living; but as no nation now makes use of them, they are called dead languages, and are therefore to be learned from books or in schools.

4. Modern languages; in which are distinguished, first, the common languages of the European nations; and secondly, the languages of the people who inhabit the three other parts of the world. See **LANGUAGE**.

PHILOMATHES, a lover of learning or science.

PHILOMELA, in fabulous history, a daughter of Pandion, king of Athens, and sister to Procne, who had married Tereus, king of Thrace. Procne being separated from Philomela, became quite melancholy, till she prevailed upon her husband to bring her sister to Thrace. Tereus obeyed, but he had no sooner obtained Pandion's permission to conduct Philomela to Thrace, than he became enamoured of her, and resolved to gratify his passion. He offered violence to Philomela, and afterwards cut off her tongue, that she might not be able to discover his barbarity. He next confined her in a lonely castle, and returned to Thrace, where he told Procne that Philomela had died by the way. Procne put on mourning for the loss of Philomela; but a year had scarcely elapsed before she was informed that her sister was not dead. Philomela, during her captivity, described on a piece of tapestry the brutality of Tereus, and privately conveyed it to Procne, who, under the pretence of celebrating the orgies of Bacchus, hastened to deliver her sister, and concerted the plan of punishing the cruelty of Tereus. She murdered her son Itylus, in the sixth year of his age, and served him up as food before her husband. Tereus, in the midst of his repast, called for Itylus, but Procne informed him he was then feasting on his flesh, and, at that instant, Philomela, by presenting the head of Itylus, convinced the monarch of the cruelty of the scene. He attempted to stab Procne and Philomela, but was instantly changed into a hoopoe, Philomela into a nightingale, Procne into a swallow, and Itylus into a pheasant. This tragical scene happened at Daulis, in Phocis.

PHILOMOT. *a.* (corrupted from *feuille morte*, a dead leaf.) Coloured like a dead leaf.

PHILONIDES, a courier of Alexander, who ran from Sicyon to Elis, 160 miles, in nine hours, and returned the same journey in fifteen hours.

PHILONOME, the second wife of Cynus, the son of Neptune. She became enamoured of Tennes, her husband's son by his first wife Proclea, the daughter of Clytius, and when he refused to gratify her passion, she accused him of attempts upon her virtue. Cynus believed the accusation, and ordered Tennes to be thrown into the sea.

PHILOSOPHEME. *s.* (φιλοσοφημα.) Principle of reasoning; theorem (*Watts*).

PHILOSOPHER. *s.* (*philosophus*, Latin; *philosophe*, French.) A man deep in knowledge, either moral or natural (*Hooker*).

PHILOSOPHER'S STONE. This, which was at first denominated *chrysopæa* (χρυσωπεια) or the golden art, or fabrication of gold, by a transmutation of the base and imperfect metals into this metal of the noblest kind, is a study which has been pursued almost immemorially by persons possessing very indistinct views of chemistry, and especially by that class of chemists who were formerly denominated alchemists.

The principle on which the last proceeded was the following. They conceived that all metals were formed of a peculiar earth, which they called mercurial, which was more or less mature in its different compounds, and more or less intermixed with sulphur or other foreign matters. In consequence of which they conceived, secondly, that in order to transmute the imperfect into perfect metals, nothing more is necessary than to free them from such foreign materials, and to mature them by sublimation.

There were other alchemists who conceived that mercury or quicksilver contains in itself the principles of all the other metals; judging chiefly from its great splendour, its great weight, and its great activity and volatility: and hence numberless experiments were attempted upon this metal, which was tortured by every possible contrivance to obtain from it that which never was in it, nor ever can be in it. In the absurdly mysterious language in which the alchemists indulged, and which was designed to lock up their art and experiments altogether from the eye of the public, we find *Aristeus*, who was a celebrated adept, thus prescribing one of the processes for subliming quicksilver with some particular alloy, in order to produce gold. "Take," says he, "king *Gabertin* and the princess *Beya* his sister, a young lady, beautiful, fair, and exceedingly delicate; marry them together, and *Gabertin* will die almost immediately. But be not alarmed: for after eighty days *Gabertin* will revive from his ashes, and become more beautiful and perfect than he was before his death; will beget with *Beya* a red child, more beautiful and perfect than themselves."

Many of these adepts were well skilled in sleight of hand, and hence often performed tricks which could not fail to impose upon the great body of those who were witnesses of them. It is related that *Helvetius*, a celebrated and truly learned Dutch physician, having one day declaimed with great violence in one of his lectures, against the vanity and absurdity of attempting to make gold, was visited by an alchemical adept, who gave him a small sample of powder, which thrown into a crucible filled with melted lead would transform the lead into gold; and that this learned physician did so, and obtained a certain quantity of that metal. *Helvetius* then hastened to the

adept for farther information upon so important a subject; but the latter had given him a false address, and was not to be found. A similar trick is said to have been played upon the emperor *Ferdinand*. An adept came to him, and offered to transform mercury into gold in his presence. Mercury was in consequence immediately put into a crucible in the witnessing of the prince, and the adept having performed certain operations, a button of gold was found at the bottom of the vessel: but while those who were present were employed in examining and assaying the gold, the adept suddenly disappeared, to the great regret of the emperor, who already beheld in idea the immense treasures which he hoped to obtain by an acquisition of this great secret.

Many similar attempts have been made at different periods in our own country, in consequence of which *Henry VI.* who appears to have been imposed upon in some such manner as the emperor *Ferdinand*, granted letters patent to certain persons who undertook to find out the philosopher's stone, and to change other metals into gold, &c. to be free from the penalty of the stat. 5 *Henry IV.* made against the attempts of deceptive alchemists. Stat. 34 *Henry VI.* 3 last. 74.

In the present day it would be a waste of time to enter into any minute detection of such impositions or absurd pretensions. We now know with tolerable decisiveness that every distinct metal is a simple substance as distinct from every other metal as fire is from frost; and that a crystal may as soon be converted into a seed as lead into mercury, or mercury into gold.

PHILOSOPHIC. PHILOSOPHICAL. *a.* (*philosophique*, Fr. from *philosophy*.) 1. Belonging to philosophy; suitable to a philosopher; formed by philosophy (*Milton*). 2. Skilled in philosophy (*Shakspeare*). 3. Frugal; abstemious (*Dryden*).

PHILOSOPHICALLY. *ad.* In a philosophical manner; rationally; wisely (*Bentley*).

To PHILOSOPHIZE. *v. a.* (from *philosophy*.) To play the philosopher; to reason like a philosopher; to moralize; to search into nature; to inquire into the causes of effects (*L'Estrange*).

PHILOSOPHY, is a word derived from the Greek, which literally signifies the love of wisdom. In its usual acceptation, however, it denotes a science or collection of sciences, of which the universe is the object; and of the term thus employed many definitions have been given, differing from one another according to the different views of their several authors. By *Pythagoras*, philosophy is defined *επιστημη των ολων*, "the knowledge of things existing;" by *Cicero*, after *Plato*, *scientia rerum divinarum et humanarum cum causis*; and by the illustrious *Bacon*, *interpretatio nature*. Whether any of these definitions be sufficiently precise, and at the same time sufficiently comprehensive, may be questioned; but if philosophy in its utmost extent be capable of being adequately defined, it is not here that the definition should be given. "Explanation," says an acute writer, (*Tatham*) is the first office of a teacher; definition, if it be

PHILOSOPHY.

good, is the last of the inquirer after truth ; but explanation is one thing, and definition quite another." It may be proper, however, to observe, that the definition given by Cicero is better than that of Pythagoras, because the chief object of the philosopher is to ascertain the causes of things ; and in this consists the difference between his studies and the natural historian, who merely enumerates phenomena, and arranges them into separate classes.

The principal objects of philosophy are, God, nature, and man. That part of it which treats of God is called theology ; that which treats of nature, physics, and metaphysics ; and that which treats of man, logic and ethics. These are not separate and independent sciences, but, as Bacon expresses it, branches from the same trunk.

The universe, that unbounded object of the contemplation, the curiosity and the researches of man, may be considered in two different points of view.

In the first place, it may be considered merely as a collection of existences, related to each other by means of resemblances and distinction, situation, succession, and derivation, as making parts of a whole. In this view it is the subject of pure description.

To acquire an acquaintance with, or a knowledge of, the universe in this point of view, we must enumerate all the beings in it, mention all their sensible qualities, and mark all these relations for each. But this would be labour immense ; and, when done, an undistinguishable chaos. A book containing every word of a language would only give us the materials, so to speak, of this language. To make it comprehensible, it must be put into some form, which will comprehend the whole in a small compass, and enable the mind to pass easily from one word to another related to it. Of all relations among words, the most obvious are those of resemblance and derivation. An etymological dictionary, therefore, in which words are classed in consequence of their resemblances, and arranged by means of their derivative distinctions, will greatly facilitate the acquisition of the language.

Just so in nature : the objects around us may be grouped by means of their resemblance, and then arranged in those groups by means of their distinctions and other relations. In this classification we are enabled to proceed by means of our faculty of abstracting our attention from the circumstances in which things differ, and turning it to those only in which they agree. By the judicious employment of this faculty, we are able not only to distribute the individuals into classes, but also to distribute those classes into others still more comprehensive, by discovering circumstances of resemblance among them : for, the fewer the circumstances are which concur to form that resemblance which has engaged our attention, the greater is the number of dissimilar circumstances which are neglected ; and the more extensive will be the class of individuals in which the resemblance is observed. Thus, a number of individuals resembling each other in the single circumstance of life, composes the most extensive kingdom of animals. If it be required that they shall further resemble in the circumstance of having feathers, a prodigious number of animals are excluded, and we form the inferior class of birds. We exclude a great number of birds, by requiring a further similarity of web feet, and have the order of anseres. If we add *lingua citiata*, we confine the

attention to the genus of anates. In this manner may the whole objects of the universe be grouped, and arranged into kingdoms, classes, orders, genera, and species.

Such a classification and arrangement is called natural history ; and must be considered as the only foundation of any extensive knowledge of nature. To the natural historian, therefore, the world is a collection of existences, the subject of descriptive arrangement. His aim is threefold.

1. To observe with care, and describe with accuracy, the various objects of the universe.

2. To determine and enumerate all the great classes of objects ; to distribute and arrange them into all their subordinate classes, through all degrees of subordination, till he arrive at what are only accidental varieties, which are susceptible of no farther distribution ; and to mark with precision the principles of this distribution and arrangement, and the characteristics of the various assemblages.

3. To determine with certainty the particular group to which any proposed individual belongs.

Description therefore, arrangement, and reference, constitute the whole of his employment ; and in this consists all his science.

Did the universe continue unchanged, this would constitute the whole of our knowledge of nature : but we are witnesses of an uninterrupted succession of changes, and our attention is continually called to the events which are incessantly happening around us. These form a set of objects vastly more interesting to us than the former ; being the sources of almost all the pleasures or pains we receive from external objects.

We are therefore much interested in the study of the events which happen around us, and strongly incited to prosecute it : but they are so numerous and so multifarious, that the study would be immense, without some contrivance for abbreviating and facilitating the task. The same help offers itself here as in the study of what may be called quiescent nature. Events, like existences, are susceptible of classification, in consequence of resemblances and distinction ; and by attention to these, we can acquire a very extensive acquaintance with active nature. Our attention must be chiefly directed to those circumstances in which many events resemble each other, while they differ perhaps in a thousand others. Then we must attend to their most general distinctions ; then to distinctions of smaller extent, and so on.

It is in this way accordingly that we have advanced in our knowledge of active nature, and are gradually, and by no means slowly, forming assemblages of events more and more extensive, and distributing these with greater and greater precision into their different classes.

In the zealous and attentive prosecution of this task, a very remarkable and interesting observation occurs. In describing those circumstances of similarity among events, and particularly in distributing them according to those similarities, it is impossible for us to overlook that constancy which is observed in the changes of nature in the events which are the objects of our contemplation. Events which have once been observed to accompany each other are observed always to do so. The rising of the sun is always accompanied by the light of day, and his setting by the darkness of night. Sound argument is accompanied by conviction, impulse by motion, kindness by a feeling of gratitude, and the perception of good by desire. The unex-

PHILOSOPHY.

cepted experience of mankind informs us, that the events of nature go on in certain regular trains; and if sometimes exceptions seem to contradict this general affirmation, more attentive observation never fails to remove the exception. Most of the spontaneous events of nature are very complicated; and it frequently requires great attention and penetration to discover the simple event amidst a crowd of unessential circumstances which are at once exhibited to our view. But when we succeed in this discovery, we never fail to acknowledge the perfect uniformity of the event to what has been formerly observed.

But this is not all: we firmly believe that this uniformity will still continue; that fire will melt wax, will burn paper, will harden clay, as we have formerly observed it to do: and whenever we have undoubted proofs that the circumstances of situation are precisely the same as in some former case, though but once observed, we expect with irresistible and unshaken confidence that the event will also be the same.

It is not surely necessary to adduce many proofs of the universality of this law of human thought. The whole language and actions of men are instances of the fact. In all languages there is a mode of construction which is used to express this relation as distinct from all others, and the conversation of the most illiterate never confounds them, except when the conceptions themselves are confounded. The general employment of the active and passive verb is regulated by it. *Turris eversa est a militibus; turris eversa est terre motu*, express two relations, and no schoolboy will confound them. The distinction therefore is perceived or felt by all who can speak grammatically. Nor is any language without general terms to express this relation, cause—effect—to occasion. Nay, it is a fact in the mind of brutes, who hourly show that they expect the same uses of every subject which they formerly made of it; and without this, animals would be incapable of subsistence, and man incapable of all improvement. From this alone memory derives all its value; and even the constancy of natural operation would be useless, if not matched or adapted to our purposes by this expectation of and confidence in that constancy.

After all the labours of ingenious men to discover the foundation of this irresistible expectation, we must be contented with saying that such is the constitution of the human mind. It is an universal fact in human thought; and for any thing that has been yet discovered, it is an ultimate fact, not included in any other still more general. We shall soon see that this is sufficient for making it the foundation of true human knowledge; all of which must in like manner be reduced to ultimate facts in human thought.

We must consider this undoubted feeling, this persuasion of the constancy of nature, as an instinctive anticipation of events similar to those which we have already experienced. The general analogy of nature should have disposed philosophers to acquiesce in this, however unwelcome to their vanity. In no instance of essential consequence to our safety or well-being are we left to the guidance of our boasted reason: God has given us the surer conduct of natural instincts. No case is so important as this: in none do we so much stand in need of a guide which shall be powerful, infallible, and rapid in its decisions. Without it we must remain incapable of all instruction from experience, and therefore of all improvement.

Our sensations are undoubtedly feelings of our mind. But all those feelings are accompanied by an instinctive reference of them to something distinct from the feelings themselves. Hence arises our perception of external objects, and our very notions of this externity (pardon the term). In like manner, this anticipation of events, this irresistible connection of the idea of fire with the idea of burning, is also a feeling of the mind: and this feeling is by a law of human nature referred, without reasoning, to something external as its cause; and, like our sensation, it is considered as a sign of that external something. It is like the conviction of the truth of a mathematical proposition. This is referred by us to something existing in nature, to a necessary and eternal relation subsisting between the ideas which are the subjects of the proposition. The conviction is the sign or indication of this relation by which it is brought to our view. In precisely the same manner, the irresistible connection of ideas is interpreted as the sensation or sign of a necessary connection of external things or events. These are supposed to include something in their nature which renders them inseparable companions. To this bond of connection between external things we give the name of causation. All our knowledge of this relation of cause and effect, is the knowledge or consciousness of what passes in our own minds during the contemplation of the phenomena of nature. If we adhere to this view of it, and put this branch of knowledge on the same footing with those called the abstract sciences, considering only the relations of ideas, we shall require demonstrative science. If we take any other view of the matter, we shall be led into inextricable mazes of uncertainty and error.

We see then, that the natural procedure of our faculty of abstraction and arrangement, in order to acquire a more speedy and comprehensive knowledge of natural events, presents them to our view in another form. We not only see them as similar events, but as events naturally and necessarily conjoined. And the expression of resemblance among events is also an expression of concomitancy; and this arrangement of events in consequence of their resemblance is in fact the discovery of those accompaniments. The trains of natural appearance being considered as the appointments of the Author of Nature, has occasioned them to be considered also as consequences of laws imposed on his works by their great author, and every thing is said to be regulated by fixed laws. But this is the language of analogy. When a sovereign determines on certain trains of conduct for his subjects, he issues his orders. These orders are laws. He enforces the observance of them by his authority; and thus a certain regularity and constancy of conduct is produced. But should a stranger, ignorant of the promulgation of these laws, and of the exerted authority of the magistrate, observe this uniformity of conduct, he would ascribe it to the genius and disposition of the people; and his observation would be as useful to him for directing the tenor of his own conduct, as the knowledge of the subject-himself of the real source of this constancy is for directing his.

Just so in nature, while the theologian pretends, from his discoveries concerning the existence and superintendence of God, to know that the constant accompaniment of events is the consequence of laws which the Great Author and Governor of the universe has imposed on his works, the ordinary philosopher, a stranger to this scene, and to the

PHILOSOPHY.

unsearchable operations of the SUPREME MIND, must ascribe this constancy to the nature of the things. There is a great resemblance between the expression *natural law* and *grammatical rule*. Rule in strict language implies command; but in grammar it expresses merely a generality of fact, whether of flexion or construction. In like manner, a law of nature is to the philosopher nothing but the expression of a generality of fact. A natural or physical law is a generally observed fact; and whenever we treat any subject as a generally observed fact, we treat it physically. It is a physical law of the understanding that argument is accompanied by conviction; it is a physical law of the affection that distress is accompanied by pity; it is a physical law of the material world that impulse is accompanied by motion.

And thus we see that the arrangement of events, or the discovery of those general points of resemblance, is in fact the discovery of the laws of nature; and one of the greatest and most important is, that the laws of nature are constant.

There is no question that this view of the universe is incomparably more interesting and important than that which is taken by the natural historian; contemplating every thing that is of value to us, and, in short, the whole life and movement of the universe. This study, therefore, has been dignified with the name of philosophy and of science; and natural history has been considered as of importance only in so far as it was conducive to the successful prosecution of philosophy.

But the philosopher claims a superiority on another account; he considers himself as employed in the discovery of causes, saying that philosophy is the study of the objects of the universe as related by causation, and that it is by the discovery of these relations that he communicates to the world such important knowledge. Philosophy, he says, is the science of causes. The vulgar are contented to consider the prior of two inseparably conjoined events as the cause of the other; the stroke on a bell, for instance, as the cause of sound. But it has been clearly shown by the philosopher, that between the blow on the bell and the sensation of sound there are interposed a long train of events. The blow sets the bell [a trembling; this agitates the air in contact with the bell; this agitates the air immediately beyond it; and thus between the bell and the ear may be interposed a numberless series of events, and as many more between the first impression on the ear and that last impression on the nerve by which the mind is affected. He can no longer therefore follow the nomenclature of the vulgar. Which of the events of this train therefore is the cause of this sensation? none of them: it is that something which inseparably connects any two of them, and constitutes their bond of union. These bonds of union or causes he considers as residing in one or both of the connected objects: diversities in this respect must therefore constitute the most important distinctions between them. They are therefore with great propriety called the qualities, the properties, of these respective subjects.

As the events from which we infer the existence of these qualities of things resemble in many respects such events as are the consequences of the exertion of our own powers, these qualities are frequently denominated powers, forces, energies. Thus, in the instance just now given of the sound of a bell, we infer the powers of impulse,

elasticity, nervous irritability, and animal sensibility.

In consequence of this inference of a necessary connection between the objects around us, we not only infer the posterior event from the prior, or, in common language, the effect from the cause, but we also infer the prior from the posterior, the cause from the effect. We not only expect that the presence of a magnet will be followed by certain motions in iron-filings, but, when we observe such motions, we infer the presence and agency of a magnet. Joy is inferred from merriment, poison from death, fire from smoke, and impulse from motion. And thus the appearances of the universe are the indications of the powers of the objects in it. Appearances are the language of nature, informing us of their causes. And as all our knowledge of the sentiments of others is derived from our confidence in their veracity; so all our knowledge of nature is derived from our confidence in the constancy of natural operations. A veracity and credulity necessarily resulting from that law of our mental constitution by which we are capable of speech, conduct us in the one case; and the constancy of nature, and the principle of induction, by which we infer general laws from particular facts, conduct us in the other. As human sentiment is inferred from language, and the existence of external things from sensation; so are the laws of nature, and the powers of natural objects, inferred from the phenomena. It is by the successful study of this language of nature that we derive useful knowledge. The knowledge of the influence of motives on the mind of man enables the statesman to govern kingdoms, and the knowledge of the powers of magnetism enables the mariner to pilot a ship through the pathless ocean.

Such are the lofty pretensions of philosophy. It is to be wished that they be well founded; for we may be persuaded that a mistake in this particular will be fatal to the advancement of knowledge. An author of great reputation gives us an opportunity of deciding this question in the way of experiment. He says that the ancients were philosophers, employed in the discovery of causes, and that the moderns are only natural historians, contenting themselves with observing the laws of nature, but paying no attention to the causes of things. If he speaks of their professed aim, we apprehend that the assertion is pretty just in general. With very few exceptions, indeed, it may be affirmed of his favourite Aristotle, the philosopher *κατ' ἐξοχὴν*, and of sir Isaac Newton. We select these two instances, both because they are set in continual opposition by this author, and because it will be allowed that they were the most eminent students of nature (for we must not yet call them philosophers) in ancient and modern times. Aristotle's professed aim, in his most celebrated writings, is the investigation of causes; and in the opinion of this author, he has been so successful that he has hardly left any employment for his successors beside that of commenting upon his works. We must on the other hand acknowledge that Newton makes no such pretensions, at least in that work which has immortalised his name, and that his professed aim is merely to investigate the general laws of the planetary-motions, and to apply these to the explanation of particular phenomena. Nor will we say that he has left no employment for succeeding enquirers; but, on the contrary, confess that he has only begun the study, has discovered but one law, and has enabled us to explain only the phenomena comprehended in it

alone. But he has not been unsuccessful; his investigation has been complete; and he has discovered beyond all possibility of contradiction a fact which is observed through the whole extent of the solar system; namely, that every body, nay that every particle in it, is continually deflected toward every other body; and that this deflection is, in every instance, proportional to the quantity of matter in that body toward which the deflection is directed, and to the reciprocal of the square of the distance from it. He has therefore discovered a physical law of immense extent. Nor has he been less successful in the explanation of particular phenomena. Of this there cannot be given a better instance than the explanation of the lunar motions from the theory of gravity begun by Newton "*Mathesi sua facem preferente;*" and now brought to such a degree of perfection, that if the moon's place be computed from it for any moment within the period of two thousand years back, it will not be found to differ from the place on which she was actually observed by one hundredth part of her own breadth.

"Discimus hinc tandem qua causa argentea
Phœbe

Passibus haud æquis graditur; cur, subdita nulli
Hactenus astronomo, numerorum frena recuset.
Quæ toties animos veterum torsere sophorum,
Quæque scholas frustra rauco certamine vexant,
Obvia conspicimus, nubem pellente mathesi;
Qua superos penetrare domos, et ardua cœli
Newtoni auspiciis jam dat contingere templa."

We may now desire the champions of the science of causes to name any one cause which has really been discovered by their great master, whether in the operations of mind or of body. But they must not on this occasion adduce the investigation of any natural law in which he has sometimes succeeded. With still greater confidence may we challenge them to produce any remarkable instance of the explanation of natural phenomena either of mind or body. By explanation, we mean an account of the production, and an appreciation of all the circumstances, susceptible of a scrupulous comparison with fact, and perfectly consistent with it. It is here that the weakness of this philosopher's pretensions is most conspicuous; and his followers candidly acknowledge, that in the enquiries which proceed by experiment, we have not derived great assistance from Aristotle's philosophy. But this, say they, does not derogate from the pre-eminence of his philosophy, because he has shown that the particular fields of observation are to be cultivated only by means of experiment. But surely every field of observation is particular. There is no abstract object of philosophical research, the study of which shall terminate in the philosophy of universals. In every kind of enquiry, that cause alone must be supposed to act which we understand so far as to be able to appreciate its effects in particular circumstances, and compare them with fact, and see their perfect coincidence. If we have discovered causes, they are known as far as they are discovered.

Their genuine effects are known, and therefore the phenomena which result from their agency are understood. When therefore it is acknowledged, as it must be acknowledged, that mankind have made but little advances in the knowledge of nature, notwithstanding the pretended discovery of causes by Aristotle, and the conducting clue of his philosophy, till of late years; and when it is also

allowed that now, while we are every day making great additions to this subordinate knowledge, the causes which Aristotle has discovered are forgotten, and his philosophy is neglected; there is great room for suspecting (to say the least), that either the causes which philosophy pretends to have discovered are not real, or that Aristotle and his followers have not aimed at the discovery of causes, but only at the discovery of natural laws, and have failed in the attempt.

There seems here to be a previous question: Is it possible to discover a philosophical cause, that something which is neither the prior nor the posterior of the two immediately adjoining events, but their bond of union, and is distinct from the union itself? It is evident that this is an enquiry purely experimental. It is of human knowledge we speak. This must depend on the nature of the human mind. This is a matter of contingency, known to us only by experiment and observation. By observing all the feelings and operations of the mind, and classing and arranging them like any other object of science, we discover the general laws of human thought and human reasoning; and this is all the knowledge we can ever acquire of it, or of any thing else.

Much has been written on this subject. The most acute observation and sound judgment have been employed in the study: and we may venture to say, that considerable progress has been made in pneumatology. Many laws of human thought have been observed, and very distinctly marked; and philosophers are busily employed, some of them with considerable success, in the distribution of them into subordinate classes, so as to know their comparative extent, and to mark their distinguishing characters with a precision similar to what has been attained in botany and other parts of natural history; so that we may hope that this study will advance like others. But in all these researches, no phenomena have occurred which look like the perception or contemplation of these separate objects of thought, these philosophical causes, this power in abstracto. No philosopher has ever pretended to state such an object of the mind's observation, or attempted to group them into classes.

We may say at once, without entering into any detail, that those causes, those bonds of necessary union between the naturally conjoined events or objects, are not only perceived by means of the events alone, but are perceived solely in the events, and cannot be distinguished from the conjunctions themselves. They are neither the objects of separate observation, nor the productions of memory, nor inferences drawn from reflection on the laws by which the operations of our minds are regulated; nor can they be derived from other perceptions in the way of argumentative inference. We cannot infer the paroxysm of terror from the appearance of impending destruction, nor the fall of a stone when not supported, as we infer the incommensurability of the diagonal and side of a square. This last is implied in the very conception or notion of a square; not as a consequence of its other properties, but as one of its essential attributes; and the contrary proposition is not only false, but incapable of being distinctly conceived. This is not the case with the other phenomenon, or any matter of fact. The proofs which are brought of a mathematical proposition, are not the reason of its being true, but the steps by which this truth is brought into our view; and frequently, as in the instance now given, this truth is

PHILOSOPHY.

perceived, not directly, but consequentially, by the inconceivableness of the contrary proposition.

Mr. Hume derives this irresistible expectation of events from the known effect of custom, the association of ideas. The related event is brought into the mind by this well-known power of custom, with that vivacity of conception which constitutes belief or expectation. But without insisting on the futility of his theory of belief, it is sufficient to observe, that this explanation begs the very thing to be proved, when it ascribes to custom a power of any kind. It is the origin of this very power which is the subject in dispute. Besides, on the genuine principles of scepticism, this custom involves an acknowledgment of past events, of a something different from present impressions, which, in this doctrine (if doctrine it can be called), are the only certain existences in nature: and, lastly, it is known that one clear experience is a sufficient foundation for this unshaken confidence and anticipation. General custom can never, on Mr. Hume's principles, give superior vivacity to any particular idea.

This certain necessity of it as a separate object of observation, and this impossibility to derive this notion of necessary and causal connection between the events of the universe from any source, have induced two of the most acute philosophers of Europe, Mr. Leibnitz and Father Malebranche, to deny that there is any such connection, and to assert that the events of the universe go on in corresponding trains, but without any causal connection, just as a well-regulated clock will keep time with the motions of the heavens without any kind of dependence on them. This harmony of events was pre-established by the Author of the universe, in suberviency to the purposes he had in view in its formation.

All those purposes which are cognisable by us, may certainly be accomplished by this perfect adjustment. But without insisting on the fantastic wildness of this ingenious whim, it is quite enough to observe, that it also is a begging of the question, because it supposes causation when it ascribes all to the agency of the Deity.

Thus have we searched every quarter, without being able to find a source from which to derive this perception of a necessary connection among the events of the universe, or of this confident expectation of the continuance of physical laws; and yet we are certain of the feeling, and of the persuasion, be its origin what it may: for we speak intelligibly on this subject; we speak familiarly of cause, effect, power, energy, necessary connection, motives and their influence, argument and conviction, reasons and persuasion, allurements and emotions, of gravity, magnetism, irritability, &c.; and we carry on conversations on these subjects with much entertainment and seeming instruction. Language is the expression of thought, and every word expresses some notion or conception of the mind; therefore it must be allowed that we have such notions as are expressed by cause, power, energy. But it is here, as in many cases, we perceive a distinction without being able to express it by a definition; and that we do perceive the relation of causation as distinct from all others, and in particular as distinct from the relation of contiguity in time and place; or the relation of agent, action, and patient, must be concluded from the uniformity of language, which never confounds them except on purpose, and when it is perceived. But even here we shall find, that none of the terms

used for expressing those powers of substance which are conceived as the causes of their characteristic phenomena really express any thing different from the phenomena themselves. Let any person try to define the terms gravity, elasticity, sensibility, and the like, and he will find that the definition is nothing but a description of the phenomenon itself. The words are all derivatives, most of them verbal derivatives, implying action, gravitation, &c. As the general resemblances in shape, colour, &c. are expressed by the natural historian by generic terms, so the general resemblances in event are expressed by the philosopher in generic propositions, which, in the progress of cultivation, are also abbreviated into generic terms.

This abundantly explains the consistency of our language on this subject, both with itself and with the operations of nature, without however affording any argument for the truth of the assumption, that causes are the object of philosophic research as separate existences; or that this supposed necessary connection is a necessary truth, whether supreme or subordinate. But since the perception of it has its foundation in the constitution of the human mind, it seems entitled to the name of a first principle. We are hardly allowed to doubt of this, when we consider the importance of it, and the care of nature to secure us in all things essential to our safety and well-being, from all danger, from inattention, ignorance, or indolence, by an instinct infallible in its information, and instantaneous in its decisions. "It would not be like her usual care (says Hume), if this operation of the mind, by which we infer like effects from like causes, and *vice versa*, were entrusted to the fallacious deduction of our reason, which is slow in its operations, appears not in any degree during the first years of infancy, and in every age and period of human life is extremely liable to error. It is more conformable to her ordinary caution (mark the acknowledgment) to secure so necessary an act of the mind by some instinct, or blind tendency, which may be infallible and rapid in all its operations, may discover itself at the first appearance of life, and may be independent of all the laboured deductions of reason. As she has taught us the use of our limbs, without giving us any knowledge of the nerves and muscles by which they are actuated; so she has implanted in us an instinct, which carries forward the thought in a course conformable to that established among external objects, though we be ignorant of the powers and forces on which this regularity depends."

Such a knowledge is quite unnecessary, and therefore causes are no more cognoscible by our intellectual powers than colours by a man born blind; nay, whoever will be at the pains to consider this matter agreeably to the received rules and maxims of logic, will find that necessary connection, or the bond of causation, can no more be the subject of philosophical discussion by man, than the ultimate nature of truth. It is precisely the same absurdity or incongruity, as to propose to examine light with a microscope. Other rational creatures may perceive them as easily as we hear sounds. All that we can say is, that their existence is probable, but by no means certain. Nay, it may be (and we never know it) that we are not the efficient causes of our own actions, which may be effected by the Deity or by ministering spirits; and this may even be true in the material world. But all this is indifferent to the real occupation of the philosopher, and does not

PHILOSOPHY.

affect either the certainty, the extent, or the utility of the knowledge which he may acquire.

We are now able to appreciate the high pretensions of the philosopher, and his claim to scientific superiority. We now see that this can neither be founded on any scientific superiority of his object, nor of his employment. His object is not causes; and his discoveries are nothing but the discovery of general facts, the discovery of physical laws; and his employment is the same with that of the descriptive historian. He observes and describes with care and accuracy the events of nature; and then he groups them into classes, in consequence of resembling circumstances, detected in the midst of many others which are dissimilar and occasional. By gradually throwing out more circumstances of resemblance, he renders his classes more extensive; and, by carefully marking those circumstances in which the resemblance is observed, he characterises all the different classes: and, by a comparison of these with each other, in respect to the number of resembling circumstances, he distributes his classes according to their generality and subordination; thus exhausting the whole assemblage, and leaving nothing unarranged but accidental varieties. In this procedure it is to be remarked, that every grouping of similar events is, *ipso facto*, discovering a general fact, a physical law; and the expression of this assemblage is the expression of the physical law. And as every observation of this constancy of fact affords an opportunity for exerting the instinctive inference of natural connection between the related subjects, every such observation is the discovery of a power, property, or quality, of natural substance. And from what has been said, this observation of event is all we know of the connection, all we know of the natural power. And when the philosopher proceeds further to the arrangement of events, according to their various degrees of complication, he is, *ipso facto*, making an arrangement of all natural powers according to their various degrees of subordinate influence. And thus his occupation is perfectly similar to that of the descriptive historian, classification and arrangement; and this constitutes all the science attainable by both.

Philosophy may therefore be defined the study of the phenomena of the universe, with a view to discover the general laws which indicate the powers of natural substances, to explain subordinate phenomena, and to improve art: or, in compliance with that natural instinct so much spoken of; philosophy is the study of the phenomena of the universe, with a view to discover their causes, to explain subordinate phenomena, and to improve art.

The task is, undoubtedly difficult, and will exercise our noblest powers. The employment is mainly in itself, and the result of it important. It therefore justly merits the appellation of philosophy, although its objects are nowise different from what occupy the attention of other men.

It is in experimental philosophy alone that hypotheses can have any just claim to admission; and here they are not admitted as explanations, but as conjectures serving to direct our line of experiments.

Effects only appear; and by their appearance, and the previous information of experience, causes are immediately ascertained by the perfect similarity of the whole train of events to other trains formerly observed: or they are suggested by more imperfect resemblances of the phenomena; and these suggestions are made with stronger or fainter

evidence, according as the resemblance is more or less perfect. These suggestions do not amount to a confidential inference, and only raise a conjecture. Wishing to verify or overturn this conjecture, we have recourse to experiment; and we put the subject under consideration in such a situation, that we can say what will be the effect of the conjectural cause if real. If this tallies with the appearance, our conjecture has more probability of truth, and we vary the situation, which will produce a new set of effects of the conjectured cause, and so on. It is evident that the probability of our conjecture will increase with the increase of the conformity of the legitimate effects of the supposed cause with the phenomena, and that it will be entirely destroyed by one disagreement.

The sphere of our intuitive knowledge is very limited; and we must be indebted for the greatest part of our intellectual attainments to our rational powers, and it must be deductive. In the spontaneous phenomena of nature, whether of mind or body, it seldom happens that the energy of that natural power which is the principle of explanation is so immediately connected with the phenomena that we see the connection at once. Its exertions are frequently concealed, and in all cases modified, by the joint exertions of other natural powers: the particular exertion of each must be considered apart, and their connection traced out. It is only in this way that we can discover the perhaps long train of intermediate operations, and also see in what manner and degree the real principle of explanation concurs in the ostensible process of nature.

In all such cases it is evident that our investigation (and investigation it most strictly is) must proceed by steps, conducted by the sure hand of logical method. As an instance selected from the material world, we may state Galileo's explanation of the cause of the rise of water in a pump. He says it is owing to the pressure of the air: that is his principle, and he announces it in all its extent. All matter, says he, is heavy, and in particular air is heavy. He then points out the connection of this general principle with the phenomenon. The rise of the water in the pump is shown to be a particular case of the general fact in hydrostatics that fluids in communicating vessels will stand at heights which are inversely as their densities, or that columns of equal weights are in equilibrium.

This way of proceeding is called arguing *a priori*, the synthetic method. It is founded on just principles; and the great progress which we have made in the mathematical sciences by this mode of reasoning shows to what length it may be carried with irresistible evidence. It has long been considered as the only inlet to true knowledge; and nothing was allowed to be known with certainty which could not be demonstrated in this way to be true. Accordingly logic, or the art of reasoning, which was also called the art of discovering truth, was nothing but a set of rules for successfully conducting this mode of argument.

Under the direction of this infallible guide, it is not surely unreasonable to expect that philosophy has made sure progress towards perfection: and as we know that the brightest geniuses of Athens and of Rome were for ages solely occupied in philosophical researches in every path of human knowledge, it is equally reasonable to suppose that the progress has not only been sure but great. We have seen that the explanation of an appearance in nature is nothing but the arrangement of it into that general class in which it was comprehended.

PHILOSOPHY.

The class has its distinguished mark, which, when it is found in the phenomenon under consideration, fixes it in its class, there to remain for ever an addition to our stock of knowledge.

The Aristotelian logic, the syllogistic art, that art so much boasted of as the only inlet to true knowledge, the only means of discovery, is in direct opposition to the ordinary procedure of nature, by which we every day, and in every action of our lives, acquire knowledge and discover truth. It is not the art of discovering truth, it is the art of communicating knowledge, and of detecting error: it is nothing more than the application of this maxim, "Whatever is true of a whole class of objects, is true of each individual of that class." This is not a just account of the art of discovering truth, nor is it a complete account of the art of reasoning. Reasoning is the producing belief; and whatever mode of argumentation invariably and irresistibly produces belief, is reasoning. The ancient logic supposes that all the first principles are already known, and that nothing is wanted but the application of them to particular facts. But were this true, the application of them, as we have already observed, can hardly be called a discovery; but it is not true; and the fact is, that the first principles are generally the chief objects of our research, and that they have come into view only now and then as it were by accident, and never by the labour of the logician. He indeed can tell us whether we have been mistaken; for, if our general principle be true, it must influence every particular case. If, therefore, it be false in any one of these, it is not a true principle. And it is here that we discover the source of that fluctuation which is so much complained of in philosophy. The authors of systems give a set of consecutive propositions logically deduced from a first principle, which has been hastily adopted, and has no foundation in nature. This does not hinder the amusement of framing a system from it, nor this system from pleasing by its symmetry; and it takes a run: but when some officious follower thinks of making some use of it, which requires the comparison with experience and observation, they are found totally unlike, and the whole fabric must be abandoned as unsound: and thus the successive systems were continually pushing out their predecessors, and presently met with the same treatment.

How was this to be remedied? The ratiocination was seldom egregiously wrong; the syllogistic art had ere now attained a degree of perfection which left little room for improvement, and was so familiarly understood by the philosophical practitioners, that they seldom committed any great blunders. Must we examine the first principles? This was a task quite new in science; and there were hardly any rules in the received systems of logic to direct us to the successful performance of it. Aristotle, the sagacious inventor of those rules, had not totally omitted it; but in the fervour of philosophic speculation he had made little use of them. His fertile genius never was at a loss for first principles, which answered the purpose of verbal disquisition without much risk of being belied on account of its dissimilitude to nature; for there was frequently no prototype with which his systematic doctrine could be compared. His enthusiastic followers found abundant amusement in following his example; and philosophy, no longer in the hands of men acquainted with the world, conversant in the great book of nature, was now confined almost entirely to recluse monks, equally ignorant of men and of things. But curiosity was awakened, and

the men of genius were fretted as well as disgusted with the disquisitions of the schools, which one moment raised expectations by the symmetry of composition, and the next moment blasted them by their inconsistency with experience.

They saw that the best way was to begin *de novo*, to throw away the first principles altogether, without exception or examination, and endeavour to find out new ones, which would stand the test of logic; that is, should in every case be agreeable to fact.

Philosophers began to reflect, that under the unnoticed tuition of kind nature we have acquired much useful knowledge. It is therefore highly probable, that her method is the most proper for acquiring knowledge, and that by imitating her manner we shall have the like success. We are too apt to slight the occupations of children, whom we may observe continually busy, turning every thing over and over, putting them into every situation, and at every distance. We excuse it, saying that it is an innocent amusement; but we should say, with an ingenious philosopher (Dr. Reid), that they are most seriously and rationally employed: they are acquiring the habits of observation; and by merely indulging an undetermined curiosity, they are making themselves acquainted with surrounding objects; they are struck by similitudes, and amused with mere classification. If some new effect occurs from any of their little plays, they are eager to repeat it. When a child has for the first time tumbled a spoon from the table, and is pleased with its jingling noise on the floor, if another lies within its reach, it is sure to share the same fate. If the child is indulged in this diversion, it will repeat it with a greediness that deserves our attention. The very first eager repetition shows a confidence in the constancy of natural operations, which we can hardly ascribe wholly to experience; and its keenness to repeat the experiment shows the interest which it takes in the exercise of this most useful propensity. It is beginning the study of nature; and its occupation is the same with that of a Newton comparing the motions of the moon by his sublime theory, and comparing his calculus with observation. The child and the philosopher are equally employed in the contemplation of a similarity of event, and are anxious that this similarity shall return. The child, it is true, thinks not of this abstract object of contemplation, but throws down the spoon again to have the pleasure of hearing it jingle. The philosopher suspects that the conjunction of events is the consequence of a general law of nature, and tries an experiment where this conjunction recurs. The child is happy and eager to enjoy a pleasure which to us appears highly frivolous; but it has the same foundation with the pleasure of the philosopher, who rejoices in the success of his experiment; and the fact, formerly a trifle to both, now acquires importance. Both go on repeating the experiment till the fact ceases to be a novelty to either: the child is satisfied, and the philosopher has now established a new law of nature.

Such (says this amiable philosopher) is the education of kind nature, who from the beginning to the end of our lives makes the play of her scholars their most instructive lessons, and has implanted in our mind the curiosity and the inductive propensity by which we are enabled and disposed to learn them. The exercise of this inductive principle, by which nature prompts us to infer general laws from the observation of particular facts, gives

us a species of logic new in the schools, but old as human nature. It is certainly a method of discovery; for by these means general principles, formerly unknown, have come into view.

It is a just and rational logic, for it is founded on, and indeed is only the habitual application of, this maxim, "That whatever is true with respect to every individual of a class of events, is true of the whole class." This is just the inverse of the maxim on which the Aristotelian logic wholly proceeds, and is of equal authority in the court of reason. Indeed the expression of the general law is only the abbreviated expression of every particular instance. See **INDUCTION**.

Philosophy has been divided into two branches, or considered under two circumstances, theoretical and practical.

Theoretical or speculative philosophy is employed in mere contemplation. Such is physics, which is a bare contemplation of nature, and natural things.

Theoretical philosophy again is usually subdivided into three kinds, viz. pneumatics, physics, or somatics, and metaphysics or ontology.

The first considers being, abstractedly from all matter: its objects are spirits, their natures, properties, and effects. The second considers matter, and material things: its objects are bodies, their properties, laws, &c.

The third extends to each indifferently: its objects are body or spirit.

In the order of our discovery, or arrival at the knowledge of them, physics is first, then metaphysics; the last arises from the two first considered together.

But in teaching, or laying down these several branches to others, we observe a contrary order; beginning with the most universal, and descending to the more particular. And hence we see why the Peripatetics call metaphysics, and the Cartesians pneumatics, the *prima philosophia*.

Others prefer the distribution of philosophy into four parts, viz. 1. Pneumatics, which considers and treats of spirits. 2. Somatics, of bodies. 3. The third compounded of both, anthropology, which considers man, in whom both body and spirit are found. 4. Ontosophy, which treats of what is common to all the other three.

Again, philosophy may be divided into three parts; intellectual, moral and physical: the intellectual part comprises logic and metaphysics; the moral part contains the laws of nature and nations, ethics and politics; and lastly the physical part comprehends the doctrine of bodies, animate or inanimate: these, with their various subdivisions, will comprize the whole of philosophy.

Practical philosophy is that which lays down the rules of a virtuous and happy life, and excites us to the practice of them. Most authors divide it into two kinds, answerable to the two sorts of human actions to be directed by it; viz. logic, which governs the operations of the understanding; and ethics, properly so called, which direct those of the will.

For the several particular sorts of philosophy, see the articles Arabian, Aristotelian, Atomical, Cartesian, Corpuscular, Epicurean, Experimental, Hermetical, Leibnitzian, Mechanical, Moral, Natural, Newtonian, Oriental, Platonic, Scholastic, Socratic, &c.

PHILOSTORGIUS, an ecclesiastical historian of Cappadocia, born about 388. He

was an Arian, and his history in 12 books begins with the controversy between Arius and Athanasius in 320, and ends about 425.

PHILOSTRATUS (Flavius), a Greek author, who wrote the life of Apollonius Tyaneus, and some other works still extant. He lived in the reign of the emperor Severus. Eusebius calls him an Athenian; Suidas a Lemnian. His style is sophisticated and affected, and the sources from whence he draws his materials are considered as not very good.

PHILOTAS, a son of Parmenio, distinguished in the battles of Alexander, and at last accused of conspiring against his life. He was tortured, and stoned to death, or according to some, stuck through with darts by the soldiers, B. C. 330. (*Curt.*).—There were others of this name, but of less note.

PHILOTIS, a servant maid at Rome, who saved her countrymen from destruction. After the siege of Rome by the Gauls, the Fidenates marched against the capital, demanding all the wives and daughters in the city, as the conditions of peace. The senators refused to comply, when Philotis advised them to send their female slaves, disguised in matron's clothes, and she offered to march herself at the head. Her advice was followed, and when the Fidenates had feasted late in the evening, and fallen asleep, Philotis lighted a torch as a signal for her countrymen to attack the enemy. The whole was successful, the Fidenates were conquered, and the senate, to reward the fidelity of the female slaves, permitted them to appear in the dress of the Roman matrons. (*Plut.* &c.)

PHILOXENUS, an officer of Alexander, who received Cilicia at the general division of the provinces. 2.—A dithyrambic poet of Cythera, who enjoyed the favour of Dionysius, tyrant of Sicily, for some time, till he offended him by seducing one of his female singers, for which he imprisoned him, and sent him to the quarries. Dionysius, at length, pleased with his pleasantry and his firmness, immediately forgave him. Philoxenus died at Ephesus, about 380 years before Christ. (*Plut.*).—There were others of inferior note of this name.

PHILTER, or **PHILTRE** (*philtrum*), in pharmacy, &c. a strainer.

PHILTER, is also used for a drug or preparation, which it is pretended will excite love.—The word is formed from the Greek *φιλος*, I love, or *φίλος*, lover. Philters are distinguished into true and spurious, and were given by the Greeks and Romans to excite love. The spurious are spells or charms, supposed to have an effect beyond the ordinary laws of nature by some magic virtue; such are those said to be given by old women, witches, &c.—The true philters are those supposed to work their effect by some natural and magnetical power. There are many grave authors who believe the reality of these philters, and allege matter of fact in confirmation of their sentiments.

To **PHILTER**. *v. a.* (from the noun.) To charm to love (*Gov. of the Tongue*).

PHILYCA, in botany. See **PHYLICA**.

PHILURA, one of the Oceanides. Saturn,

to escape from the vigilance of Rhea, changed himself into a horse, to enjoy the company of Philyra, by whom he had a son, half a man and half a horse, called Chiron. Philyra, ashamed of giving birth to such a monster, entreated the gods to change her nature. She was metamorphosed into a tree, called by her name among the Greeks.

PHIMOSIS. (*φίμωσις*, from *φίμω*, to bind up). The prepuce is formed by a continuation of the skin of the penis, which serves to cover the glans when the penis is not erected, and to allow for the time extension of the penis when erected; at which time, this portion of the skin that formed the prepuce does not cover the glans, but falls back upon the penis, and serves to cover part of that. The phimosis is a constriction or straitness of the extremity of the prepuce, which, preventing the glans from being uncovered, is often the occasion of many troublesome complaints. It may arise from different causes, both in children and grown persons. Children have naturally the prepuce very long; and as it exceeds the extremity of the glans, and is not liable to be distended, it is apt to contract its orifice, to produce a lodgement of a small quantity of urine about the glans, which if it remain so as to grow corrosive, will irritate the parts and produce inflammation, and perhaps excoriation, with an increased thickening and contraction of the prepuce so as scarcely to allow a probe to pass. The only mode of cure is by an operation. A phimosis may affect grown persons who cannot denude their glans, or at least not without pain, from the very same or some similar cause; we notwithstanding find them sometimes troubled with a phimosis, which might be suspected to arise from a venereal taint, but has, in reality, a much more innocent cause. There are, we know, sebaceous glands situated in the prepuce, round the corona, which secrete an unctuous humour, which sometimes becomes acrimonious, irritates the skin that covers the glans, and the irritation extending to the internal membrane of the prepuce, they both become inflamed, and yield a purulent serum, which cannot be discharged, because the glans is swelled, and the orifice of the prepuce contracted. We find also some grown up persons, who, though they never uncovered the glans, have been subject to phimosis from a venereal cause. In some, it is owing to gonorrhœa, where the matter lodged between the prepuce and the glans occasioned the same excoriation as the discharge before mentioned from the sebaceous glands. In others, it proceeds from venereal chancres on the prepuce, the glans, or the frænum; which producing an inflammation either on the prepuce or glans, or both, the extremity of the foreskin contracts, and prevents the discharge of the matter. The parts in a very little time are greatly tumified, and sometimes a gangrene comes on in less than two days.

PHINEUS, in fabulous history, a son of Agenor, king of Phenicia, or according to some, of Bithynia. He married Cleopatra, the

daughter of Boreas, by whom he had Plexippus and Pandion. After her death, he married Idæa, the daughter of Dardanus. Idæa, jealous of Cleopatra's children, accused them of attempts upon her virtue, and they were immediately condemned by Phineus to be deprived of their eyes. This cruelty was soon after punished by the gods. Phineus suddenly became blind, and the harpies were sent by Jupiter, to spoil the meats which were placed on his table. He was however delivered from these dangerous monsters by Zetes and Calais, who pursued them as far as the Strophades. He also recovered his sight by means of the Argonauts, whom he had received with great hospitality, and instructed in the easiest and speediest way by which they could arrive in Colchis. The causes of the blindness of Phineus are a matter of dispute among the ancients. Phineus was killed by Hercules.

PHIZ. *s.* (a ridiculous contraction from *physiognomy*.) The face (*Stepney*).

PHLEBOTOMIST. *s.* (from *φλεβ*, and *τεμνω*.) One that opens a vein; a blood-letter.

To PHLEBOTOMIZE. *v. a.* (*phlebotomiser*, Fr.) To let blood (*Howel*).

PHLEBOTOMY. (*phlebotomia*, *φλεβοτομία*, from *φλεβ*, a vein, and *τεμνω*, to cut.) The opening of a vein.

PHLEGETHON, a river of hell, whose waters were burning, as the word *φλεγω*, from which the name is derived, seems to indicate.

PHLEGM. (*phlegma*, *φlegma*, from *φλεγω*, to burn or to excite.) In chemistry it means water, but, in the common acceptation of the word, it is a thick and tenacious mucus secreted in the lungs.

PHLEGMAGOGUES. (from *φlegma*, phlegm, and *αγω*, to drive.) Medicines which promote a discharge of phlegm.

PHLEGMASIA (*phlegmasia*, *φlegμασία*, from *φλεγω*, to burn.) An inflammation.

PHLEGMASIA DOLENS. This disease principally affects women in the puerperal state; in a few instances it has been observed to attack pregnant women; and, in one or two cases, nurses on losing their children have been affected by it. Women of all descriptions are liable to be attacked by it during and soon after childbirth: but those whose limbs have been pained or anasarcous during pregnancy, and who do not suckle their offspring, are more especially subject to it. It has rarely occurred oftener than once to the same female. It supervenes to easy and natural, as well as to difficult and preternatural births. It sometimes makes its appearance in 24 or 48 hours after delivery, and at other times not till a month or six weeks after; but, in general, the attack takes place from the 10th to the 16th day of the lying in. It has, in many instances, attacked women who were recovering from puerperal fever; and in some cases has supervened, or succeeded, to thoracic inflammation. It not uncommonly begins with coldness and rigors; these are succeeded by heat, thirst, and other symptoms of pyrexia; and then pain, stiffness, and other symptoms of topical inflam-

PHLEGMASIA DOLENS.

inflammation supervene. Sometimes the local affection is from the first accompanied with, but is not preceded by, febrile symptoms. Upon other occasions, the topical affection is neither preceded by puerperal fever, nor rigors, &c. but soon after it has taken place the pulse becomes more frequent, the heat of the body is increased, and the patient is affected with thirst, headach, &c. The pyrexia is very various in degree in different patients, and sometimes assumes an irregular remittent, or intermittent type. The complaint generally takes place on one side only at first, and the part where it commences is various; but it most commonly begins in the lumbar, hypogastric, or inguinal region, on one side, or in the hip, or top of the thigh; and corresponding labium pudendi. In this case the patient first perceives a sense of pain, weight and stiffness in some of the above-mentioned parts, which are increased by every attempt to move the pelvis or lower limb. If the part be carefully examined, it generally is found rather fuller or hotter than natural, and tender to the touch, but not discoloured. The pain increases, always becomes very severe, and in some cases is of the most excruciating kind. It extends along the thigh, and when it has subsisted for some time longer or shorter in different patients, the top of the thigh and the labium pudendi become greatly swelled, and the pain is then sometimes alleviated, but accompanied with a greater sense of distention. The pain next extends down to the knee, and is generally the most severe on the inside and back of the thigh, in the direction of the internal cutaneous and the crural nerves; when it has continued for some time, the whole of the thigh becomes swelled, and the pain is somewhat relieved. The pain then extends down the leg to the foot, and is commonly the most severe in the direction of the posterior tibial nerve; after some time the parts last attacked begin to swell, and the pain abates in violence, but is still very considerable, especially on any attempt to move the limb. The extremity being now swelled throughout its whole extent, appears perfectly, or nearly uniform, and it is not perceptibly lessened by an horizontal position, like an oedematose limb. It is of the natural colour, or even whiter; is hotter than natural; excessively tense, and exquisitely tender when touched. When pressed by the finger in different parts it is found to be elastic, little, if any, impression remaining, and that only for a very short time. If a puncture or incision be made into the limb, in some instances no fluid is discharged; in others a small quantity only issues out, which coagulates soon after; and in others a larger quantity of fluid escapes, which does not coagulate; but the whole of the effused matter cannot be drawn off in this way. The swelling of the limb varies both in degree, and in the space of time requisite for its full formation. In most instances it arrives at double the natural size, and in some cases at a much greater. In lax habits, and in patients whose legs have been very much affected with anasarca during pregnancy, the swelling takes place

more rapidly than in those who are differently circumstanced; it sometimes arrives, in the former class of patients, at its greatest extent in 24 hours, or less, from the first attack.

Instead of beginning invariably at the upper part of the limb, and descending to the lower, this complaint has been known to begin in the foot, the middle of the leg, the ham, and the knee. In whichever of these parts it happens to begin, it is generally soon diffused over the whole of the limb, and when this has taken place, the limb presents the same phenomena, exactly, that have been stated above, as observable when the inguen, &c. are first affected.

After some days, generally from two to eight, the febrile symptoms diminish, and the swelling, heat, tension, weight, and tenderness of the lower extremity begin to abate, first about the upper part of the thigh, or about the knee, and afterwards in the leg and foot. Some inequalities are found in the limb, which at first feel like indurated glands, but upon being more nicely examined, their edges are not so well defined as those of conglobate glands; and they appear to be occasioned by the effused matter being of different degrees of consistence in different points. The conglobate glands of the thigh and leg are sometimes felt distinctly, and are tender to the touch, but are seldom materially enlarged; and as the swelling subsides, it has happened, that an enlargement of the lymphatic vessels in some part of the limb has been felt, or been supposed to be felt.

The febrile symptoms having gradually disappeared, the pain and tenderness of the limb being much relieved, and the swelling and tension being considerably diminished, the patient is debilitated and much reduced, and the limb feels stiff, heavy, benumbed, and weak. When the finger is pressed strongly against it for some time in different points, it is found to be less elastic than at first, in some places retaining the impression of the finger for a longer, in other places for a shorter time, or scarcely at all. And, if the limb be suffered to hang down, or if the patient walk much, it is found to be more swelled in the evening, and assumes more of an oedematose appearance. In this state the limb continues for a longer or shorter time, and is commonly at length reduced wholly, or nearly to the natural size.

Hitherto the disease has been described as affecting only one of the inferior extremities, and as terminating by resolution, or the effusion of a fluid that is removed by the absorbents; but, unfortunately, it sometimes happens, that after it abates in one limb, the other is attacked in a similar way. It also happens, in some cases, that the swelling is not terminated by resolution; for sometimes a suppuration takes place in one or both legs, and ulcers are formed which are difficult to heal. In a few cases a gangrene has supervened. In some instances the patient has been destroyed by the violence of the disease, before either suppuration or gangrene have happened.

The predisposing causes of this disease, when it occurs during the pregnant or puerperal state,

or in a short time afterwards, appeared to be:
1. The increased irritability and disposition to inflammation which prevail during pregnancy, and in a still higher degree for some time after parturition. 2. The over-distended, or relaxed state of the blood-vessels of the inferior part of the trunk and of the lower extremities, produced during the latter months of utero-gestation.

Amongst the exciting causes of this disease may be enumerated: 1. Contusions, or violent exertions of the lower portions of the abdominal and other muscles inserted in the pelvis or thighs, or of the muscles of the inferior extremities, and contusions of the cellular texture connected with these muscles during a tedious labour. 2. The application of cold and moisture, which are known to act very powerfully upon every system in changing the natural distribution of the circulating fluids, and consequently in a system predisposed by parturition, may assist in producing the disease, by occasioning the fluids to be impelled in unusual quantity into the weakened vessels of the lumbar, hypogastric, and inguinal regions, and of the inferior extremities. 3. Suppression, or diminution of the lochia, and of the secretion of milk, which, by inducing a plethoric state of the sanguiferous system, may occasion an inflammatory diathesis, may favour congestion, and the determination of an unusual quantity of blood to the vessels of the parts just mentioned, and thus contribute to the production of an inflammation of these parts. 4. Food taken in too large quantity, and of a too stimulating quality, especially when the patient does not give suck. This cause both favours the production of plethora, and stimulates the heart and arteries to more frequent and violent action; the effects of which may be expected to be particularly felt in the lumbar, hypogastric, or inguinal regions, and in the lower extremities, from the state of their blood vessels. 5. Standing, or walking too much, before the arteries and veins of the lower half of the body have recovered sufficiently from the effects of the distention, which existed during the latter months of pregnancy. This must necessarily occasion too great a determination of blood to these parts, and consequently too great a congestion in them; whence they will be more stimulating than the upper parts of the body, and inflammation will sometimes be excited in them.

From an attentive consideration of the whole of the phenomena observable in this disease, and of its remote causes and cure, no doubt remains, Dr. Hull thinks, that the proximate cause consists in an inflammatory affection, producing suddenly a considerable effusion of serum and coagulating lymph from the exhalants into the cellular membrane of the limb.

PHLEGMASIE. Inflammations. The second order in the class pyrexiae of Cullen's nosological arrangement, characterized by pyrexia, with topical pain and inflammation; the blood after venesection exhibiting a buffy coat. See **MEDICINE**.

PHLEGMATIC. *a.* (φλεγματικός.) 1. Abounding in phlegm (*Arb.*). 2. Generating phlegm

(*Brown*). 3. Watery (*Newton*). 4. Dull; cold; frigid (*Southern*).

PHLEGMON. (*phlegmone*, φλεγμονή, from φλεγω, to burn.) An inflammation of a bright red colour, with a throbbing and pointed tumour tending to suppuration. A species of phlogosis of Cullen.

PHLEGMONOUS. *a.* (from *phlegmon*.) Inflammatory; burning (*Harvey*).

PHLEGON, who was surnamed Trallianus, was born in Trallis, a city of Lydia. He was the emperor Hadrian's freedman, and lived to the 18th year of Antoninus Pius; as is evident from his mentioning the consuls of that year. He wrote several works of great erudition, of which we have nothing left but fragments. Among these was a History of the Olympiads, a Treatise of Long-lived Persons, and another of Wonderful Things; the short and broken remains of which Xylander translated into Latin, and published at Basil in 1568, with the Greek and with notes. Meursius published a new edition of them with his notes at Leyden, in 1622. The titles of part of the rest of Phlegon's writings are preserved by Suidas. It is supposed that the history of Hadrian, published under Phlegon's name, was written by Hadrian himself, from this passage of Spartianus: "Hadrian thirsted so much after fame (says he), that he gave the books of his own life, drawn up by himself, to his freedmen, commanding them to publish those books under their own names; for we are told that Hadrian wrote Phlegon's books."

PHLEGRA, or **PHLEGREÆUS CAMPUS**, a place of Macedonia, where the giants attacked the gods, and were defeated by Hercules. The combat was afterwards renewed in Italy, in a place of the same name near Cumæ, &c.

PHLEGYÆ, a people of Thessaly. Some authors place them in Bœotia. They received their name from Phlegyas, the son of Mars, with whom they plundered and burned the temple of Apollo at Delphi.

PHLEGYAS, in fabulous history, a son of Mars, king of Lapithæ in Thessaly. He was father of Ixion and Coronis, to whom Apollo offered violence. When he heard that his daughter had been abused, he marched an army against Delphi, and reduced the temple of the god to ashes. Apollo, in resentment, killed Phlegyas, and placed him in hell, where a huge stone hangs over his head.

PHLEME. *s.* (from *phlebotomy*.) An instrument for letting blood, which is placed on the vein and driven into it with a blow.

PHLEUM. Cat's-tail; Timothy grass. In botany, a genus of the class triandria, order digynia. Calyx two-valved, one-flowered, sessile, linear, truncate, ending in a point, inclosing, and longer than the corol. Five species; four of them common to the pastures, mountains, meadows or sea-marshes of our own country; and cultivated as a useful food for cattle. See **HUSBANDRY**.

PHLOAS, in zoology, a genus of the class vermes, order testacea. Animal an ascidia; shell bivalve, divaricate, with several less diffe-

rently shaped accessory ones at the hinge; hinges recurved, united by a cartilage; in the inside beneath the hinge is an incurved tooth. The inhabitants of this genus perforate clay, spongy stones and wood, while in their younger state; and as they increase in size enlarge their habitation within, and thus become imprisoned: they contain a phosphorous liquor of great brilliancy in the dark, and which illuminates whatever it touches or happens to fall upon.

It is equally extraordinary by what means this curious worm is able to burrow and work its way in the midst of massy stones, as the nature of the phosphorous light which it so copiously secretes. The organ by which it appears to work is a fleshy substance placed near the lower extremity of the shell, of the shape of a lozenge, and considerably large in proportion to the size of the animal; it is by perseverance alone, therefore, and by great length of time that it is able to scoop out an augmentation to the cavity it inhabits. The minute opening by which the worm, when very small, insinuated itself into the interior of the substance it inhabits is generally to be traced, and at once subverts the absurd opinion of those who have asserted that the phloas is at first hatched in these holes.

The light emitted is of a very peculiar kind. Its existence has been long known, for it is noticed by Pliny, who observes that it shines in the mouth of the person who eats it, and makes him luminous if it touch but his hand or clothes. Putrescency, though not putrefaction, is necessary for the discharge of the light possessed by phosphorescent fishes; in the phloas, on the contrary, the light is rendered brighter in proportion to the freshness of the animal. The moisture of salt or fresh water revives it; brandy suddenly extinguishes it; vinegar not quite so soon. It is probable that this worm often contributes to the luminous appearance of the sea.

Various experiments have been made to render the light or luminous matter secreted by the phloas permanent, but none have altogether succeeded. Reaumur kneaded the juice into paste with flour, and found that the paste would give light when immersed in warm water. But the best way to preserve the light is to preserve the worm, or fish as it is usually called, in honey, in which state whenever taken out and plunged into warm water, it will give a very brilliant light for a twelvemonth afterwards. Milk, however, appears to be rendered more luminous by this phosphorous matter than any other liquid; a single phloas made seven ounces of milk so luminous that the faces of persons in the dark could be seen and distinguished by it.

There are twelve species of this curious animal; three of which are common to the seas of our own coast. We shall select a specimen or two.

1. *P. dactylus*. Shell oblong, with reticulate, subspinous striæ on the upper part. Inhabits among the rocks of Europe; and luminous by night; entirely white, with sometimes an ochraceous cast, thin, fragile, elongated, and

wedge-shaped on the fore-part, convex behind; the margin inflected; marked with subspinous striæ, which become gradually more indistinct; hinge resembling a spoon; accessory valves four.

2. *P. pusilla*. Shell oblong, rounded, with arched striæ; white or brownish. Inhabits America and India, and penetrates the bottoms of ships.

3. *P. hians*. Shell bivalve, white, with transverse arched striæ; above connivent; convex in the middle; beneath wedge-shaped, with a very large oval aperture. Inhabits the American islands, and perforates calcareous rocks and corals.

PHLOGISTIC SYSTEM. Becher was the first chemist who adopted a separate principle of inflammability, by which he explained, not only the action of fire, and the combustion of bodies, but many of the most remarkable phenomena in chemistry at that time known. He considered it as an element, and like his two others, of the nature of earth; for which reason he termed it his second or inflammable earth. Stahl determined this notion of the inflammable principle more accurately, and gave it the name of phlogiston. But he differed from the opinion of his tutor, with respect to the nature of this substance, which he asserted to be a sulphureous principle. According to him, it exists in all the bodies of the three kingdoms, in a greater or less proportion, water, simple earths, and salts excepted.

It is phlogiston alone that constitutes the combustible part in inflammable bodies, or in the words of Stahl, "*est solum ad ignis motum accommodatum, creatum et aptum; est ignis corporeus, vel ipsa præcise propria materies ignis.*" Phlogiston nevertheless does not itself, without being combined with other bodies, form fire, "*sed avolat et dissipatur in tenuitate insensibili, sive facit dumtaxat ignem valde expansum et inconspicuum, scilicet calorem;*" but, also, this volatilization and dissipation cannot take place without the access of other matter, especially water and air.

After phlogiston has, combined in a greater or less proportion with the other natural bodies, it changes their external, and, chiefly, their chemical properties. Its action is most conspicuous upon metals, sulphur, colours, and odoriferous substances.

But, when chemistry became enriched with a multitude of new facts, it was found that Stahl's established theory of phlogiston could not explain every phenomenon: Chemists, therefore, endeavoured to render it more definite, and, at the same time, more general in its application. But in these definitions we observe the utmost disagreement; and almost every author differs on this subject.

PHLOGISTON. (from φλογίζω, to burn or inflame.) The principle of combustion upon the theory of Stahl, and which the variable and uncertain state of present chemistry renders it proper that instead of totally exploding, we should still keep in view, and compare with the newest discoveries.

PHLOGISTON.

The process of combustion, which is one of the most striking and most familiar of all the natural phenomena, has for ages engaged the attention of philosophers. For our purpose, however, and limited as we are to a small space which we must make the most of, it will be sufficient to observe that there have been at least three hypotheses in modern times to account for combustion, together with several modifications of each. The first in order of date is the phlogistic theory which was brought to a very ingenious system by Stahl, who is generally looked upon as its author. This able philosopher supposes that all inflammable bodies (or such as burn with emission of light and heat) contain a portion of an intangible and imponderable substance called phlogiston, to which they owe their inflammability with all its attendant phenomena. Whilst a body is burning, it parts with this phlogiston, which passes into combination with the ambient air; and by this means it is usually reduced to an ash; but if a metal, to a calx or oxyd; either of which differs from the original substance in merely being deprived of phlogiston. And hence (to take a metal as an example) in order to reduce the calx or oxyd to the metallic state, it is necessary to unite it with some inflammable substance, such as charcoal, which restores its phlogiston, and brings it back to the metallic or reguline state.

But this ingenious hypothesis was made before the discovery of oxygen, and before the precise agency of air in maintaining combustion was understood, and hence the several modifications made to all the then known chemical facts were essentially defective.

The discovery of oxygen by Dr. Priestley followed at no great length of time, which gave rise to the admirable and beautiful researches of Lavoisier on the subject of combustion, in which this excellent philosopher demonstrated that in all cases of combustion, the inflammable substance united with oxygen, and produced either an acid, or an oxyd, or water, or a mixture of these three; and that the weight of the product above that of the simple combustible was exactly equal to the quantity of oxygen that had disappeared. In this respect, therefore, the system so finely brought out by Lavoisier was not so much an improvement of Stahl's as an essential addition to it, and all other previous theories, by accounting for the increase of weight of the product of combustion over that of the combustible. But combustion implies (as we have already noticed on that article) the disengagement of light and heat, which was still to be explained, and this was done by Lavoisier to the exclusion of phlogiston (the existence of which was at all times very problematical), by supposing oxygen gas to be a compound of oxygen with heat and light; and hence whilst a body burns, according to Lavoisier, it absorbs oxygen from the air, separating it from the heat and light with which it was united, and which then appear in the separate form of fire. This system therefore allows of no other difference between combustion and

slow oxygenation than that in the former case, the process advancing rapidly, the heat and light separated from the oxygen gas appear in the form of visible flame, and in the latter they escape slowly and imperceptibly to the senses.

From the way in which Lavoisier expresses himself, however, it might be supposed that he conceived that the only portion of caloric which could be set free during combustion was that which is essential to the gaseous form, or that which makes the sole difference between a solid body and the same body gassified, analogous to the difference in this respect between steam and fluid water. Hence it would follow that no oxygen in solid or liquid combination could maintain combustion, a position which is instantly refuted by the well-known power of the solid oxygen of nitre and oxymuriat of potash to inflame charcoal, or the liquid oxygen of nitric acid to enkindle essential oils.

If, therefore, oxygen be the source of the heat disengaged during combustion (which is extremely probable) it must be allowed in several instances to carry the greater part of its heat with it into various combinations, so that the oxygen of nitric acid which can support combustion must be allowed to be different from that of water (for example) which cannot: and nitric acid, therefore, must be called a compound of nitrogen and of oxygen with its caloric; and water a compound of hydrogen and of oxygen without its caloric. This distinction has been well pointed out by Brugnatelli, who terms the former state thermoxygen and the latter simple oxygen.

It is a presumptive argument, too, that the heat given out during combustion is chiefly derived from the oxygen, that the increase of temperature is generally pretty accurately proportioned to the quantity of oxygen consumed, as was found by Lavoisier and La Place in their experiments with the calorimeter.

Several objections of weight, however, oppose the hypothesis that light is also a constituent part of oxygen gas, or of oxygen in any state fit to support combustion. One of the strongest is that the quantity of light given out in this process is not proportioned to the quantity of heat, and the circumstance of the various colours which the flame assumes, according to the nature of the combustible body, would seem rather to indicate that it is this latter, and not the oxygen gas, which is the principal source of the light. This opinion has therefore been adopted by several chemists of late years, among whom are Gren, Brugnatelli, and Dr. Thomson: and according to this system, the process of combustion is in fact a double decomposition, in which the combustible body unites with oxygen to form an oxyd, or water, or an acid, according to circumstances, while the light of the combustible combines with the caloric of the oxygen, and produces the flame or fire.

It will be easily seen that this system in one part bears a resemblance to the ancient hypothesis of phlogiston, inasmuch as both of them

suppose a something to be contributed by the combustible body itself towards the composition of the fire or flame, and this too appears on the whole more consonant with the general phenomena of combustion and oxygenation. But still there remain a vast number of difficulties to be cleared up before it can be fully admitted. The late very ingenious and very important series of experiments by Mr. Davy tend indeed to re-conduct us in a very considerable degree to the original foundation of the phlogistic theory, for they seem to indicate the existence of a distinct inflammable principle that pervades all nature; and could we get over the difficulty of the utter imponderability of this principle upon the Stahl hypothesis, we apprehend it would not be long before it would be once more embraced in all its essential doctrines.

PHLOGOSIS. (φλογωσις, from φλογω, to inflame.) See **INFLAMMATION**.

PHLOMIS. Sage-tree; Jerusalem sage. In botany, a genus of the class didynamia, order gymnospermia. Calyx angular; upper lip of the corol incumbent, compressed, villous. Twenty-seven species; natives of the south of Europe, Asia, or the Cape. The following are cultivated.

1. *P. fruticosa*. Common Jerusalem sage.
2. *P. purpurea*. Sharp-leaved, purple phlomis.
3. *P. Italica*. Blunt-leaved, purple phlomis.
4. *P. lychnitis*. Sage-leaved phlomis.
5. *P. laciniata*. Jagged-leaved phlomis.
6. *P. tuberosa*. Tuberous phlomis.
7. *P. Zeylanica*. White phlomis.
8. *P. nepetifolia*. Catmint phlomis.
9. *P. leonurus*. Narrow-leaved phlomis.
10. *P. leonitis*. Dwarf-shrubby phlomis.

All the tribe have perennial roots, and many of them perennial stalks. The latter rise from two to five or six feet high, and are adorned with yellow, blue or purple flowers in whorls. They are all ornamental; most require a greenhouse, but a few will bear the external air in a sheltered situation.

PHLOX. Lychnidea, or bastard lychnis. In botany, a genus of the class pentandria, order monogynia. Corol salver-shaped, filaments unequal; stigma three-cleft; calyx prismatic; capsule three-celled, one-seeded. Twelve species, all North American plants. The following are cultivated.

1. *P. paniculata*. Panicle lychnidea.
2. *P. suaveolens*. White-flowered lychnidea.
3. *P. maculata*. Spotted-stalked lychnidea.
4. *P. pilosa*. Hairy-leaved lychnidea.
5. *P. Carolina*. Carolina lychnidea.
6. *P. glaberrima*. Smooth lychnidea.
7. *P. divaricata*. Early-flowering lychnidea.

The plants of this genus have perennial roots with herbaceous stalks from nine inches to two feet in height, adorned with tubulated flowers of a white or purple colour. They are propagated by offsets, and will bear the winter of our own country.

PHLYCTÆNÆ. (φλυκταιναι, small blad-

ders.) Small pellucid vesicles, that contain a serous fluid.

PHLYZACIUM. (φλυζακιον, from φλυζω, to be hot.) A pustule on the skin excited by fire or heat. See **PUSTULE**.

PHOCA. Seal. In zoology, a genus of the class mammalia, order fereæ. Fore-teeth acute, upper six, parallel, outer ones larger; lower six, parallel, distinct, equal, obtusish; tusks twice as long, acute, robust, solitary, the upper remote from the fore-teeth, the lower from the grinders; grinders five or six, narrow, tricuspidate; earless; hind-feet fettered.

This is a dirty, curious, quarrelsome tribe, easily tamed, and polygamous; flesh succulent, tender; fat and skin useful; they inhabit and swim under water, and crawl on land with difficulty, because of their retracted fore-feet, and united hind-feet; feed on fishes and marine productions, and swallow stones to prevent hunger, by distending the stomach.

1. *P. vitulina*. Sea calf. Head without neck, smooth; body brown; large black eyes; large whiskers; oblong nostrils; a flat head and nose; tongue forked at the end. It has six cutting teeth in the upper jaw, four in the lower; a short tail; body covered with thick short hair; toes furnished with strong sharp claws; usual length from five to six feet; colour various; dusky, brindled, or spotted with white or yellow. Inhabits most quarters of the globe, but in greatest numbers towards the north and south. They swarm near the Arctic circle, and in the lower parts of South America, in both oceans. They are also found in the Caspian sea, in the lake Aral, in the Baikal and Oron. Those in the fresh water lakes are less than those that frequent the salt water.

These seals produce two young at a time. They bring forth in autumn, and suckle their young, which are white and woolly, in caverns, or in rocks, till they are six or seven weeks old, when they take them to sea. They cannot continue long under water; and are therefore very frequently obliged to rise to take breath, and often float on the waves. In summer they sleep on rocks, and on sand banks; if surprised, they hasten to the sea; if at any distance from it, they scramble along and fling up the sand, and small stones, with great force with their hind-feet, making a piteous moaning: if overtaken, they offer a vigorous defence with their feet and teeth. A slight blow on the nose kills them; otherwise they will bear a multitude of wounds. They swim with vast strength and swiftness; frolic greatly in their element, and sport without fear about ships and boats, which may have given rise among the ancients to the fables of sea nymphs and sirens. They never go to any great distance from the land; feed on all sorts of fishes, and are themselves good food, and often eaten by voyagers: but they are generally killed for the sake of the oil made from their fat: a young seal will yield eight gallons. Their skins are used for waistcoats, covers for trunks, and other conveniences. Seals are the wealth of the

Greenlander, supplying him with every necessary of life. This species is the phoca of the Roman writers.

2. *P. mutica*. Long-necked seal. Body slender; its length from the nose to the fore-legs equal to that from the fore-legs to the tail; fore-feet resemble fins, and have no claws.

3. *P. Australis*. Falkland Isles seal. Ears short, pointed; about four feet long; covered with short ashcoloured hair, tipped with dirty white; nose short and beset with strong black bristles; no claws on the fore-feet; but on the toes of the hind-feet four, long and straight. These are found also as far distant as New Zealand.

4. *P. testudo*. Tortoise seal. Head resembling a tortoise; neck slenderer than its head and body; its feet are like those of the common seal. It is said to be found on the shores of many parts of Europe; but the species is very little known.

5. *P. fasciata*. Ribbon seal. Short fine bristly hair, of an uniform colour, almost black, marked along the sides, and towards the head and tail, with a stripe of a pale yellow colour, exactly resembling a ribbon, laid on it by art; sometimes resembling harness. Inhabits the Kurile Islands.

6. *P. laniger*. Leporine seal. Covered with fur, soft as that of a hare, upright and interwoven, of a dirty white colour; whiskers long and thick, so that the animal appears bearded; head long; upper lip thick: has four cutting teeth both above and below; and nails on both the fore and hind-feet: usual length six feet and a half; greatest circumference five feet two. Inhabits the White Sea during the summer; and is found also off Iceland, and on the coast of Spitzbergen.

7. *P. barbata*. Great seal. Head smooth, without ears; body blackish: grows to the length of twelve feet. Inhabits the north of Scotland, and the south of Greenland.

8. *P. hispida*. Rough seal. Head smooth, without ears; body covered with bristly hair of a pale brown, intermixed like that of a hog. Inhabits Greenland. The natives make garments of the skin, turning the hairy side inmost.

9. *P. monachus*. Hooded seal. Head without ears; hind-feet without nails; has a strong folded skin on its fore-head, which it can fling over its eyes and nose, to defend them against stones and sand in stormy weather: hair white, with a thick coat of black wool under it, which makes it appear of a fine grey. Inhabits only the south of Greenland and Newfoundland. The hunters say they cannot kill it till they remove the hood or integument on the head.

10. *P. Groenlandica*. Harp seal. Head smooth, without ears; pointed head; and thick body, of a whitish grey colour, marked on the sides with two black crescents, the horns pointing upwards towards each other. It attains this mark only in its fifth year; till which period it changes its colour annually, and is called by different names each year. It in-

habits Greenland, Newfoundland, Iceland, the White Sea, and Frozen Ocean, and passes through the Asiatic Strait as far as Kamchatka. It is the most valuable kind of any, both for its skin and oil. It grows to the length of nine feet.

11. *P. psilla*. Little seal. Head smooth, with the appearance of ears; body brown. About two feet four inches long, has soft smooth hair, longer than that of the common seal, dusky on the head and back, and brownish beneath; teeth above bifurcated; two of them below three-pointed.

12. *P. ursina*. Sea-bear; Ursine seal. Head with external ears. There are three marine animals, which keep a particular situation, and seem divided between the N.E. of Asia and the N.W. of America. These are what are called the sea-lion, the sea-bear, and the manati. Like the sea-otters, they are confined to the narrow seas, between lat. 50 deg. and 56 deg. They are also common in New Zealand, about Staten Island and the Falkland Islands. Mr. Pennant suspects they may also resort to Juan Fernandez.

The ursine seal is a name which Mr. Pennant has substituted for that of the sea-bear. These animals lead, during the three summer months, a most indolent life! They arrive at the islands prodigiously fat; but during the above time they are scarcely ever in motion. They confine themselves for whole weeks to one spot, sleep a great part of the time; eat nothing; and except the employment the females have in suckling their young, they are totally inactive. They live in families; each male has from eight to fifty females, whom he guards with the jealousy of an eastern monarch; and though they lie by thousands on the shores, each family keeps itself separate from the rest; and sometimes, with the young and unmarried ones, amount to a hundred and twenty. The old animals, which are destitute of females, or deserted by them, live apart, and are excessively splenetic, peevish, and quarrelsome. The whole tribe are extremely fierce; and so attached to their old haunts, that they would die sooner than quit them. If another approach their station, or attempt to seduce a female, they are roused from their indolence, and a battle ensues; in the course of the conflict they perhaps intrude on the seat of a third: this gives new cause of offence, so that in the end the discord becomes universal, and is spread along the whole shore; but excepting in such cases the battle is fought fairly combatant with combatant.

The wounds they give and receive are very deep, and resemble the cuts of a sabre. At the end of a fight they fling themselves into the sea, to wash away the blood.

The males are very fond of their young, but very tyrannical towards the females: if a man attempt to take one of their cubs, the male stands on the defensive, while the female makes off with the young in her mouth; should she drop it, he instantly quits the enemy, falls on

her, and beats her against the stones till he leaves her for dead. As soon as she recovers, she comes in the most suppliant manner to the male, crawls to his feet, and washes them with her tears; while he in the mean time stalks about in the most insulting manner; but in case the young one is carried off, he melts into the deepest affliction, shews every sign of deep concern, and sheds tears plentifully. The female brings but one at a time generally, never more than two.

They swim very swiftly, at the rate of seven miles an hour, and can continue a long time under water. They are very tenacious of life, and will live for a fortnight after receiving such wounds as would immediately destroy almost any other animal. The male is vastly superior in size to the female. The body of each is of a conic form, very thick before, and tapering to the tail. The length of a large male is eight feet, circumference five; near the tail twenty inches; weight 800 pounds. The nose projects like that of a pug dog, but the head rises suddenly; the nostrils are oval, divided by a septum; the lips thick; their insides red and serrated; the whiskers long and white; the teeth, in all thirty-six, lock into each other when the mouth is closed; the tongue is bifid; the eyes large and prominent; the iris black; the pupil emerald; the eyes may be covered at pleasure with a fleshy membrane: ears small, sharp-pointed; hairy without, smooth and polished within.

The length of the fore-legs is twenty-four inches; like those of other quadrupeds, and not immersed in the body like those of other seals. The feet are formed with toes, but are covered with a naked skin, having only the rudiments of nails on five latent toes. The hind-legs are twenty-two inches long, fixed to the body, but capable of being brought forward; so that the animal can use them to scratch its head. These feet are divided, each into five toes, connected with a great web, a foot broad; the tail is only two inches long.

The hair is long and rough, with a soft down of a bay colour beneath. The hair on the neck of the old males stands erect. The general colour of these animals is black; but the hair of the old ones is tipped with grey. The females are cinereous. The skins of the young ones cut out of their dams are very useful for cloathing, and cost about 3s. 4d. each; the skin of an old one 4s. The fat and flesh of the old males is very nauseous; but that of the females resembles lamb. The young ones roasted are as good as sucking pigs.

13. *P. leonina*. Bottle-nosed seal. Body brown; head crested on the fore-part; snout of the male projecting five or six inches below the lower jaw: the upper part a loose wrinkled skin, which the animal, when angry, has the power of blowing up, so as to give the nose an arched appearance; feet short and dusky, with five toes on each, furnished with nails; hind-feet with the appearance of great laciniated fins; eyes large; great whiskers; short dun hair on the body; that on the neck a little longer;

skin very thick: the old males twenty feet in length, and fifteen in circumference.

The female has a blunt nose, tuberculous at the top; wide nostrils; a mouth breaking very little into the jaws; conic teeth; eyes oblique and small; fore-legs twenty inches long; toes with flat oblong nails. Its hind parts are divided into two great forked fins, without any tail: the whole body is covered with short rust-coloured hair. The length from the nose to the end of the fins is four yards; its greatest circumference two and a half. They inhabit the seas about New Zealand, Juan Fernandez, Falkland Islands, from S. lat. 54. deg. 40 min. The males shew little attachment, but the females are excessively fond of their young. Towards evening both male and female swim a little way to sea, the last with its young on its back. The French call both this and the ursine species by the common name of sea-wolves. One of them has been known to yield a butt of oil, and its blood to fill two hogsheds. The flesh is eatable. Lord Anson's people ate it under the denomination of beef; to distinguish it from that of one or two other species which they called lamb.

They assemble in families like the former species, but not in such numbers. The males shew equal jealousy about their females; and their combats are equally bloody. When at peace, to prevent surprise, each herd places a centinel, who gives certain signals at any appearance of danger. During the breeding season they abstain from food; and, before that is elapsed, become very lean: at other times they feed on fishes and smaller seals. See Nat. Hist. Pl. CLXVIII.

PHOCÆA, a maritime town of Ionia, in Asia minor, between Cumæ and Smyrna, founded by an Athenian colony. It received its name from Phocus, the leader of the colony, or from (*phocæ*) seals, which are found in great abundance on the coast.

PHOCENSES and ΦΟΚΙΟΙ, the inhabitants of Phocis in Greece.

PHOCION, an Athenian, celebrated for his public and private virtues. He was educated in the school of Plato, and of Xenocrates, and distinguished himself by his zeal for the public good, and his military abilities. He often checked the violence and inconsiderate measures of Demosthenes. When Philip endeavoured to make himself master of Eubœa, Phocion obliged him to relinquish his enterprize. During the time of his administration, he was always inclined to peace, though he never suffered his countrymen to become indolent. He was 45 times appointed governor of Athens, though he never solicited that high office. In his rural retreat, or at the head of the army, he always appeared barefooted, and without a cloak. His integrity as well as his temperance was highly eminent. Philip, as well as his son Alexander, attempted to bribe him, but to no purpose, and Phocion boasted in being one of the poorest of the Athenians, and in deserving the appellation of the good. It was through him that Greece was saved from an impending

war, and he advised Alexander rather to turn his arms against Persia than to shed the blood of the Greeks, who were either his allies or his subjects. Antipater, who succeeded in the government of Macedonia after the death of Alexander, also attempted to corrupt Phocion, but to no effect. But virtues like these could not long stand against the insolence and fickleness of an Athenian assembly. When the Piræus was taken, Phocion was accused of treason, and fled for safety to Polyperchon, who sent him back to Athens; where he was immediately condemned to drink the fatal poison. He took the cup with the greatest serenity, and, as he drank the fatal draught, he prayed for the prosperity of Athens. He died about 318 years B. C. having exceeded his 80th year. His merits, however, were not buried in oblivion; the Athenians repented of their ingratitude, and honoured his memory by raising him statues, and putting to a cruel death his guilty accusers.

PHOCIS, a country of Greece, bounded on the east by Bœotia, and by Locris on the west, originally extending from the bay of Corinth to the sea of Eubœa, and reaching on the north as far as Thermopylæ. Phocis received its name from Phocus, a son of Ornytion, who settled there. The inhabitants were called Phocenses. Parnassus was the most celebrated of its mountains, and Delphi the greatest of its towns. Phocis is rendered famous for a war which it maintained against some of the Grecian republics, and which has received the name of the Phocian war.

PHOCUS, son of Phocion, was dissolute in his manners, and unworthy of the virtues of his great father. He was sent to Lacedæmon to imbibe there the principles of sobriety, of temperance, and frugality. He cruelly revenged the death of his father, whom the Athenians had put to death. (*Plut.*)—2. A son of Ornytion, who led a colony of Corinthians into Phocis. He cured Antiope, a daughter of Nycteus, of insanity, and married her.

PHOCYLIDES, a Greek poet and philosopher of Miletus, flourished about 540 years before the Christian era. The poetical piece now extant, attributed to him, is not of his composition, but of another poet who lived in the reign of Adrian.

PHCEBE, a name given to Diana, or the moon, on account of the brightness of that luminary. She became, according to Apollodorus, mother of Asteria and Latona. See **DIANA**.

PHCEIDAS, a Lacedæmonian general, sent by the Ephori to the assistance of the Macedonians against the Thracians. He seized the citadel of Thebes, for which he was disgraced and banished from the Lacedæmonian army. He died B. C. 377. (*C. Nep. &c.*)

PHCEBICENA, a surname of Æsculapius, as being descended from Phœbus.

PHCEBUS, a name given to Apollo, or the sun. This word expresses the brightness and splendor of that luminary. See **APOLLO**.

PHCENICE, or **PHCENICIA**, a country of

Asia, at the east of the Mediterranean. Phœnicia, according to Ptolemy, extended on the north as far as the Eleutherus, a river which falls into the Mediterranean sea, a little below the island of Aradus, and it had Pelusium on the territories of Egypt, as its more southern boundary, and Syria on the east. Sidon and Tyre were the capital towns of the country. The invention of letters is attributed to its inhabitants, and commerce and navigation were among them in the most flourishing state. The Phœnicians were originally governed by kings. They were subdued by the Persians, and afterwards by Alexander, and remained tributary to his successors and the Romans. They were called Phœnicians from Phœnix, son of Agenor, one of their kings, or from the great number of palm-trees which grow in the neighbourhood.

There is some disagreement among authors with respect to the northern limits of this country. Ptolemy, as above remarked, makes the river Eleutherus the boundary of Phœnicia to the north; but Pliny, Mela, and Stephanus, place it in the island of Aradas, lying north of that river. Strabo observes, that some will have the river Eleutherus to be the boundary of Seleucia, on the side of Phœnis and Cœlesyria. On the coast of Phœnicia, and south of the river Eleutherus, stood the following cities; Simyra, Orthosia, Tripolis, Botrys, Ryblus, Ralæbyblus, Berytus, Sidon, Sarepta, Tyrus, Palætyrus.

Phœnicia extended, according to Ptolemy, even beyond Mount Carmelus; for that geographer places in Phœnicia not only Eedippa and Ptolemais, but Sycaminum and Dæra, which stand south of that mountain. These, however, properly speaking, belonged to Palestine. We will not take upon us to mark out the bounds of the midland Phœnicia. Ptolemy reckons in it the following towns: Arca, Palæbyblus (Old Byblus), Gabala, and Cæsaria Pania. This province was considerably extended in the times of Christianity; when, being considered as a province of Syria, it included not only Damascus but Palmyra also.

PHCENICOPTERUS. Flamingo. In zoology, a genus of the class aves, order grallæ. Bill naked, toothed, bent as if broken; nostrils linear; feet four-toed, palmate, the membranes semicircular on the fore-part; hind-toe not connected. These birds intermix the character of the anseres with that of the grallæ; they have a long neck and legs; bill large, the upper mandible carinate above, and toothed on the edge, lower compressed, transversely furrowed, and nostrils covered with a thin membrane. There are only two species, as follow.

1 **P. ruber**. Red flamingo. Quill feathers black; body smaller than that of the stork; when erect six feet high from the tip to the bill; perpetually twists its head round when eating, so that the upper mandible touches the ground; tongue covered with about twelve papillæ, which are hooked backwards and cartilaginous at the tip; head small, round; bill seven inches long, partly red, partly black, and

eroded; legs and thighs slender, and not thicker than the fore-finger of a man, yet two feet long; neck equally slender, three feet long. From this extraordinary shape, the bird is able to wade into the water, to the depth where its food is found; but, though the feet are webbed, it seldom uses them for swimming: its length from bill to tail is four feet four inches.

The plumage of the flamingo is not less remarkable than its figure, being of a bright flame-coloured red. Like all other birds of extraordinary brilliancy of colour, it is an inhabitant of the tropical and warm climates. It is found from the Mediterranean, in every district of Africa, to the Cape of Good Hope. In Congo, Angola, and Bissao, where the negroes hold them in superstitious veneration, the flamingoes have multiplied to such a degree that they are seen in thousands around their villages. Among this simple people, their society is considered as the gift of heaven, and as a protection against many of the evils of life. Whence they allow none of them to be killed, and conceive it no hardship to be continually stunned with their cries, which are heard, for near a mile, all round their habitations.

These birds, though they never venture far into the temperate or colder climates, have found means to penetrate into South America and the West Indies, where they assume the very same appearance as those in Europe. Labat gives a very curious account of the manner in which they build their nests, which, he says, consist of a heap of fat earth, or of clay, collected in a marsh, and rising about twenty inches above the water, which always covers the base. Upon the top of this pyramid, a little hollowed out for the reception of the eggs, the female sits and hatches; perched as it were, upon her rump, with her legs hanging down, like a man sitting upon a stool. Dampier also describes the ridiculous posture of these birds while hatching; which, he justly observes, arises from the enormous length of their limbs, which renders it impossible to fold them under them, like those of other birds.

The young, which are never above three in number, do not fly, till they are nearly at their full growth; but run very swiftly a few days after their exclusion from the shell. At first their plumage is of a clear grey, which, for two years, brightens gradually into its vivid igneous hue, and then acquires its full lustre. The food of the flamingo is shell-fishes, aquatic insects, and the spawn of fishes. While feeding, they keep together in large flocks, drawn up artificially in lines, which, at a distance, exactly resemble an army in order of battle; and, like all gregarious birds, they employ a few to act as centinels, for the security of the rest while feeding. On the approach of danger, these set up a loud clangor like that of a trumpet, which is heard at a great distance, and is the signal upon which the rest take wing. So shy are these birds, that, when surprised by the sudden appearance of an enemy, they remain motionless; and continue so much

overwhelmed with astonishment, that almost all the individuals of a flock may be knocked down, one after another.

Catesby, Dampier, and other travellers, speak variously concerning the flesh of the flamingo, as an article of diet; a circumstance not to be wondered at, since food appears either good or bad, in a great measure, according to the appetite of him who uses it. It was a dish in high repute among the luxurious Romans; and Apicius, so famous in the annals of gluttony, is recorded by Pliny as the person who discovered the exquisite relish of the flamingo's tongue, and a new method of seasoning it. Some of the modern travellers, probably from an affected deference to the opinion of the ancients, have spoken also in high terms of the exquisite flavour of the flamingo's tongue. It must surely prove a costly dish; and the man who would gratify himself by frequently eating it, would prove a more extensive plunderer than the most ravenous of the rapacious birds.

In some parts these birds are tamed, principally for the sake of their skins, which are covered with a very fine down, and applicable to all the purposes for which that of the swan is employed. When taken young, they grow so familiar, that, in a few days, they will eat from the hand. Even the old birds lay aside their wild habits, and submit to captivity; living in perfect harmony with the poultry, along with which they feed. But, however easily these birds submit to domestication, they are never found to thrive in that state: none of those, that have been made captives by the natives of America, have been found to breed under their care. The young are extremely tender and delicate; and even the old birds are so sensible to cold, that they approach the fire constantly in their native climates, where they have been brought into a domestic state.

Snares and lures are laid, in order to catch those that are running wild; and sometimes the natives make use of tame birds for this purpose. The method employed is, to drive the latter into the parts frequented by the wild birds, and there to lay meat for them. No sooner do the wild flamingoes see the decoys devouring the meat, than they advance to partake of it. A battle then ensues between the parties, when the bird-catchers, who lie concealed hard by, spring up, and secure them.

2. *P. Chilensis*. Chilese flamingo. Quill-feathers white; bill covered with a reddish skin; head suberected. Inhabits Chili; five feet long from the bill to the claws. See Nat. Hist. Pl. CLXIX.

PHŒNIX, *Φοινῖς*, in astronomy, a constellation of the southern hemisphere; unknown to the ancients, and invisible in our northern parts.

The number of stars in this constellation is thirteen, viz. 0.1.4.7.1.0. taking them in the order of their magnitudes.

This constellation took its name and form from those of a bird famous among the ancients; but generally looked upon by the moderns as fabulous.

The naturalists speak of this bird as single, or the only one of its kind; they describe it as of the size of an eagle; its head finely crested, with a beautiful plumage; its neck covered with feathers of a gold colour, and the rest of its body purple; only the tail white, intermixed with carnation; and its eyes sparkling like stars. They hold, that it lives five or six hundred years in the wilderness; that, when thus advanced in age, it builds itself a funeral pile of sweet wood, and aromatic gums; then it fires it with the wafting of its wings, and thus burns itself; and from its ashes arises a worm, which, in time, grows up to be another phoenix.

Hence the Phœnicians gave the name phoenix to the date palm-tree; because, when burnt down to the very root, it naturally rises again fairer than ever.

Ancient historians reckon four appearances of the phoenix; the first, in the reign of Sesostris; the second, in that of Amasis; the third, in that of the third Ptolemy; and the fourth, according to Dion Cassius, as a presage of the death of Tiberius, but Tacitus refers it to Egypt under the empire of Tiberius, and Pliny to the consulate of Quintus Plancius, which took place A. D. 36.

The ancients, however, speak of the phoenix as a fabulous bird.

The ancient Christians refer to the phoenix in some of their accounts of the resurrection.

PHŒNIX. The most celebrated of this name are the two following:—1. A son of Amyntor, king of Argos, by Cleobule, or Hippodamia, who was preceptor to young Achilles. It is said that Amyntor, jealous of his son on account of his concubine, Clytia, whose favours Cleobule urged Phoenix to solicit, actually put out the eyes of his son, upon which he meditated the death of his father. Reason and piety, however, prevailed over passion, and Phoenix, not to become a parricide, fled from Argos to the court of Peleus, king of Phthia. Here he was treated with tenderness; Peleus carried him to Chiron, who restored him to his eye-sight, and soon after he was made preceptor to Achilles, his benefactor's son. He was also made king of the Dolopes. He accompanied his pupil to the Trojan war, and Achilles was ever grateful for the precepts which he had received from Phoenix. He died in Thrace, and was buried, according to Strabo, near Trachinia, where a small river in the neighbourhood received the name of Phoenix.—2. A son of Agenor, who was, like his brothers Cadmus and Cilix, sent in pursuit of his sister Europa (see CADMUS, EUROPA); and when his enquiries proved unsuccessful, he settled in a country, from him called Phœnicia. From him, as some suppose, the Carthaginians were called Pœni.

PHŒNIX. Date-palm. Date-tree. In botany, a genus of the class dioecia, order tetrandria. Calyx three-parted; corol three-petalled. Male: anthers linear, four-sided. Female: pistil one; drupe ovate; seed solitary. Two species.

1. *P. farinifera*, an East Indian tree with pinnate fronds longer than the trunk.

2. *P. dactylifera*. Pinnate fronds shorter than the trunk: a native of Arabia and Persia. The trunk rises to sixty, eighty, or a hundred feet high; the stalks are generally full of rugged knots, which are the vestiges of the decayed fronds, for the trunks of these trees are not solid, but the centre is filled with pith, around which is a tough bark full of strong fibres while young, but as the tree grows old this bark hardens and becomes woody; to it the fronds are closely joined, and rise erect in the centre, being closely folded, or plaited together; but after they are advanced above the sheath which surrounds them they expand very widely on every side of the stem, and as the older fronds decay the stalk advances in height; the fronds when grown to a size for bearing fruit are six or eight feet long, and may be termed branches (for the tree has no other); these have narrow long pinnae set alternately on their whole length; the small lobes are towards the base, three feet long, and little more than one inch broad; they are closely folded together when they first appear, and are wrapt round by brown fibres or threads, which fall off as the foliage advances, making way for its spread. These pinnae never open flat, but are hollow like the keel of a boat, with a sharp ridge on their back; they are very stiff, and when young of a bright green, terminating in a sharp black spine.

It is necessary for fructification that male trees grow near the female, or those that produce fruit: the flowers of both sexes issue from the trunk in very long branches, and are covered with a spath or sheath which opens and withers: those of the male have six short stamens with narrow four-cornered anthers filled with farina. The female flowers have no stamens, but have a roundish germ which afterwards becomes an oval berry, with a thick pulp inclosing a hard oblong drupe with a deep furrow running longitudinally: the bunches of fruit are sometimes very large.

The berries of this tree are the dates of the shops, which are imported into our own country from the Levant.

The cultivation of the date-tree has been tried in Jamaica, but does not flourish well; and there are but few of them growing in the island at present. The fruit of the tree cultivated in Spain and France looks well to the eye, but seldom becomes thoroughly ripe. In our own country the tree is sometimes raised from exotic seeds, as a green-house plant, but it never arrives at sufficient perfection to produce either fruit or flower.

Though the date-tree grows every where on the northern coasts of Africa, it is seldom carefully cultivated except beyond mount Atlas; for the heat is not sufficiently powerful along the coasts to bring the fruits to proper maturity. To the inhabitants of all that part of Zaara which is near mount Atlas, the only part of the desert indeed which is inhabited, the date-tree supplies the place of corn, which grows

with great difficulty, and will scarcely produce either barley or maize. The trees are here planted without any order, at the distance of twelve feet from each other, males intermixed with females, in the neighbourhood of rivulets and streams that issue from the sand.

There is scarcely any part of the date-tree which is not useful. The wood, though of a spongy texture, lasts such a number of years, that the inhabitants of the country say it is incorruptible. They employ it for making beams and instruments of husbandry; it burns slowly, but the coals which result from its combustion are very strong, and produce a great heat. The Arabs strip the bark and fibrous parts from the young date-trees, and eat the substance, which is in the centre; it is very nourishing, and has a sweet taste; it is known by the name of the marrow of the date-tree. They eat also the leaves, when they are young and tender, with lemon juice; the old ones are laid out to dry, and are employed for making mats and other works of the same kind, which are much used, and with which they carry on a considerable trade in the interior parts of the country. From the sides of the stumps of the branches which have been left arise a great number of delicate filaments of which they make ropes, and which might serve to fabricate cloth.

A white liquor, known by the name of milk, is drawn also from the date-tree; to obtain it, all the branches are cut from the summit of one of these trees, and after several incisions have been made in it, they are covered with leaves, in order that the heat of the sun may not dry it. The sap drops down into a vessel placed to receive it, at the bottom of a circular groove made below the incisions. The milk of the date-tree has a sweet and agreeable taste when it is new; it is very refreshing, and is given to sick people to drink, but it generally turns sour at the end of 24 hours. Old trees are chosen for this operation, because the cutting of the branches, and the large quantity of sap which flows from them, greatly exhaust them, and often cause them to decay. The male flowers of the date-tree are also useful. They are eaten when still tender, mixed up with a little lemon juice. They are reckoned to be very provocative; the odour which they exhale is probably the cause of this property being ascribed to them. These date-trees are very lucrative to the inhabitants of the desert. Some of them produce twenty bunches of dates; but care is always taken to lop off a part of them, that those which remain may become larger; ten or twelve bunches only are left on the most vigorous trees. It is reckoned that a good tree produces, one year with another, about the value of ten or twelve shillings to the proprietor. A pretty considerable trade is carried on with dates in the interior part of the country, and large quantities of them are exported to France and Italy. The crop is gathered towards the end of November. When the bunches are taken from the tree, they are

hung up in some very dry place, where they may be sheltered and secure from insects.

Even the stones, though very hard, are not thrown away. They give them to their camels and sheep as food, after they have bruised them, or laid them to soften in water.

The date, as well as other trees which are cultivated, exhibits great variety in its fruit, with respect to shape, size, quality, and even colour. There are reckoned to be at least twenty different varieties. Dates are very liable to be pierced by worms, and they soon corrupt in moist or rainy weather.

From what has been said, it may easily be perceived that there is, perhaps, no tree whatever used for so many and so valuable purposes as the date-tree.

PHOLAS. See **PHLOAS**.

PHOLUS, one of the Centaurs, who kindly entertained Hercules when he was going against the boar of Erimanthus; but he refused to give him wine, which belonged to the rest of the Centaurs. Hercules, without ceremony, broke the cask. The smell of the liquor drew the Centaurs to the house of Pholus, but Hercules killed the greatest part of them. Pholus intertered the slain, but he mortally wounded himself with one of the arrows poisoned with the venom of the hydra, which he attempted to extract from the body of one of the Centaurs. Hercules, unable to cure him, buried him when dead, and called the mountain where his remains were deposited by the name of Pholoe.

PHONICS. (from *φωνη*, voice or sound.) The doctrine or science of sounds. See **ACOUSTICS**. This science has been considered as analogous to that of optics, and is divided into direct, refracted, and reflected; these have been called phonics, diaphonics, and cataphonics; but the terms are now well nigh obsolete. Phonics is a science that may be improved with regard to the object, the medium, and the organ. The object may be improved with respect to the production and propagation of sounds. With regard to the medium, phonics may be improved by its thinness and quiescence, and by the sonorous body being placed near a smooth wall, either plain or arched, more especially if it be formed after some peculiar curve, as from this arises the theory and practice of whispering places. Sound is much sweetened if it is propagated in the vicinity of water, and on a plain it will be conveyed much further than on uneven ground.

PHONOCA'MPTIC. *a.* (*φωνη* and *καμπηλω*.) Having the power to inflect or turn the sound, and by that means to alter it (*Derham*).

PHORCUS, or **PHORCYS**, a sea deity, son of Pontus and Terra, who married his sister Ceto, by whom he had the Gorgons, the dragon that kept the apples of the Hesperides, and other monsters.

PHORMIS, an Arcadian, who acquired great riches at the court of Gelon and Hiero, in Sicily. He dedicated the brazen statue of a mare to Jupiter Olympus, in Peloponnesus,

which so much resembled nature, that horses came near it, as if it had been alive.

PHORMIUM. Flax-plant. In botany, a genus of the class hexandria, order monogynia. Corol six-petalled, inferior; the three inner petals longer; calyxless; stamens ascending, exerted; capsule oblong, three-sided; seeds oblong, compressed. One species, a native of New Zealand.

P. tenax. The leaves resemble those of flax; the flowers are in one variety yellow, in another a deep red. Of the leaves of this plant the New Zealanders, with very little preparation, make all their common apparel, and also their strings, lines, and cordage for every purpose, as well as the whole of their canvas and matting, all which are prodigiously stronger than any thing we can manufacture from hemp. From the same plant, by another preparation, they draw long slender fibres which shine like silk and are as white as snow. Of these, which are also very strong, they make their finest cloths; and of the leaves, without any other preparation than splitting them into proper breadths and tying the strips together, they make their fishing nets, of which some are of an enormous size. The seeds of this valuable plant have been brought over into England, but upon trial were not found to vegetate. It does not appear to us, however, that a fair or sufficient trial has ever been given; and it is probable that the seeds, however torpid, might be made to germinate if infused for an hour or two, antecedently to their being put into garden pots, in a solution of oxymuriatic acid.

PHOSOXYGEN (from $\phi\omega\varsigma$, light, and $\sigma\acute{\upsilon}\nu$, and $\gamma\epsilon\eta\epsilon\iota\varsigma$, oxygen), a term coined by Mr. Davy to express more accurately that compound which Lavoisier has denominated, and which is usually called after him oxygen gas, as being supposed to have oxygen and caloric for its constituent ingredients; but which, in opposition to M. Lavoisier, Mr. Davy conceives to be a combination of oxygen and light, without any caloric whatever, properly so called.

We believe we are now, for the first time, introducing this term into any work of general science; yet the frequency of its recurrence in the writings of Mr. Davy, and the importance of the supposed compound itself to the general train of his reasoning on a variety of physiological as well as of chemical subjects, render it necessary that we should make our readers acquainted with it.

In effect phosoxxygen, or the union of oxygen and light, forms the very basis of this ingenious philosopher's theory of respiration. Having laid it down as a fact that caloric does not exist as a substance *sui generis*, or in any other manner than as a peculiar motion, perhaps a vibratory motion of the corpuscles of bodies tending to separate them, and, consequently, that it consists in repulsive motion; and having endeavoured to establish that light does exist in a state of union with oxygen, and that the substance denominated oxygen gas is this very compound, he ultimately determines that the chemical process of respiration consists in the combina-

tion of phosoxxygen with the venous blood in the lungs, and in the liberation of carbonic acid and of aqueous gass from it. From this combination and decomposition arises an increase of repulsive motion, which, combined with that produced by the other chemical processes taking place in the system, and that generated by the reciprocal action of the solids and fluids, is the cause of animal heat.

In opposition to the Lavoisierian theory, which accounts for the conversion of the deep Modena hue of the venous blood in the lungs into a bright scarlet by the iron contained in the blood being transformed into a red oxyd, through the slow combustion produced by the action of the caloric and oxygen, introduced into the lungs from the atmosphere in every act of inspiration, he asserts,

1st. That iron never decomposes phosoxxygen (oxygen gass, or oxygen and caloric) at so low a temperature as 98 degrees, the greatest heat of the lungs; nor in any circumstances below rapid combustion, flame, and intense heat.

2d. Oxygen is never decomposed by carbon (as the carbon of the blood) at so low a temperature as 98 degrees, nor ever decomposed, in like manner, below rapid combustion, flame, and intense heat.

3d. Oxygen gass, or phosoxxygen, is never decomposed by hydrogen at so low a temperature as 98 degrees; and that, as above, this process never takes place without flame.

And in direct opposition to the propositions thus negated; he contends, affirmatively,

1st. That phosoxxygen combines, in an undecomposed state, with the venous blood in the lungs; and,

2d. That carbonic acid and water are both liberated from the lungs during this process, either by the increase of temperature, or from the superior affinity of phosoxxygen for the venous blood.

The experiments upon this subject are highly ingenious, and the reasoning is at least plausible; but the subject of respiration, like that of combustion, is still left in much doubt and perplexity. For the rest, see the article **RESPIRATION**.

PHOSPHAT. PHOSPHITE. There are a variety of compounds of which phosphorus is the base, the nature of which should be therefore well understood, before the reader attempts to acquire any knowledge of the compounds which originate from it. Were we writing as monogrammists, we should, hence, certainly treat of phosphorus in the first place, and afterwards treat of its derivatives, among which range the two substances at the head of this article; but confined as we are to an alphabetical arrangement, we must, for the most part, discuss the different subjects which come before us in their alphabetical relation. We recommend to our readers, however, to peruse the article on **PHOSPHORUS**, before they run over the present, because they will have a much more accurate view of it than otherwise. We shall take leave, however, to connect the two substances, above stated, in a single article, because they have a strong natural connection, and will be far more easily comprehended by such an union.

The salts formed by the union of the phosphoric acid with different bases are called phosphats; those produced in like manner by the phosphorous

PHOSPHATE.

acid are called phosphites. See the articles **PHOSPHORIC ACID** and **PHOSPHOROUS ACID**.

PHOSPHATES may be distinguished by the following properties: 1. When heated with combustibles, they are not decomposed, nor is phosphorus obtained. 2. Before the blowpipe they are converted into a globule of glass, which in some cases is transparent, in others opaque. 3. Soluble in nitric acid without effervescence, and precipitated from that solution by lime-water. 4. Decomposed, at least partially, by sulphuric acid; and their acid, which is separated, when mixed with charcoal and heated to redness, yields phosphorus. 5. After being strongly heated, they often phosphoresce.

The phosphates readily combine with an excess of acid, and form superphosphates.

The phosphates at present known amount to twelve, two of which are triple salts. Some of these salts occur in different states, constituting varieties.

1. *Phosphat of barytes*. It may be prepared either by saturating phosphoric acid with barytes or carbonate of barytes, or by mixing together an alkaline phosphat and nitrat or muriat of barytes. In either case, the phosphat of barytes precipitates immediately in the form of a white powder.

This salt is tasteless, incrustallizable by art, insoluble in water, and not altered by exposure to the air. Its specific gravity is 1.2867. When strongly heated, it melts into a grey coloured enamel. The proportion of its component parts is unknown.

This salt has not been applied to any use.

When phosphoric acid is dropt into a solution of barytes water, a precipitate of phosphat of barytes immediately falls. But this precipitate is redissolved by adding an excess of acid. Hence it follows, that this salt is capable of combining with an additional dose of acid, and forming a superphosphat of barytes.

2. *Phosphat of strontian*. Like the former, it may be formed by dissolving carbonate of strontian in phosphoric acid, or by mixing together nitrat of strontian and phosphat of soda. A white precipitate immediately falls, which is the phosphat of strontian.

This salt is tasteless, insoluble in water, and not alterable by exposure to the air. It is soluble in an excess of phosphoric acid; a property which distinguishes it from phosphat of barytes. Before the blowpipe it fuses into a white enamel, and at the same time emits a phosphoric light. It is completely decomposed by sulphuric acid, but by no other. According to Vauquelin, it is composed of

41.24 acid
58.76 strontian.

100.00

3. *Phosphat of lime*. Of this salt there are two varieties, the first neutral, the other a supersalt.

a. *Phosphat of lime, proper*. As this salt constitutes the basis of bones, it is not necessary to prepare it artificially. It may be obtained in a state of purity by the following process: Calcine the bones to whiteness, reduce them to powder, and wash them repeatedly with water, to separate several soluble salts which are present. Dissolve the whole in muriatic acid, and precipitate by means of ammonia. The precipitate, when well washed and dried, is pure phosphat of lime.

Phosphat of lime, thus prepared, is always in the state of a white powder; but it is found native in regular crystals. In that state it is known by the name of apatite. The primitive form of its crystals is, according to Hauy, the regular six-sided prism; and the primitive form of its intergranular particles is a three-sided prism, whose bases are equilateral triangles; but it very often assumes other forms. It is destitute of taste, insoluble in water, and not liable to be altered by exposure to the air. It may be exposed to a strong heat without undergoing any change; but in a very violent heat it becomes soft, and is converted into a white semitransparent enamel, or rather porcelain. According to the experiments of Saussure, a heat of 378 degrees Wedgwood is necessary to produce this effect.

Sulphuric, nitric, muriatic, fluoric, and several vegetable acids, are capable of decomposing phosphat of lime; but the decomposition is only partial. Fourcroy and Vauquelin have ascertained, that these acids are only capable of abstracting 0.40 parts of the lime, while the remainder continues combined with the phosphoric acid, constituting a superphosphat of lime. Hence the reason that phosphoric acid is capable also of decomposing partially the combinations of these acids with lime; it abstracts as much of the lime as is sufficient to convert it into superphosphat. Phosphat of lime, according to Fourcroy and Vauquelin, is composed of

41 acid
59 lime

100.

This salt is employed in making cupels; and almost solely in extracting phosphorus. It is also used, occasionally, as a medicine in rickets.

6. *Superphosphat of lime*. It is this salt which always remains in the aqueous solution when calcined bones are decomposed by means of sulphuric acid; and it may be formed artificially by dissolving phosphat of lime in phosphoric acid, till the acid refuses to take up any more, and afterwards evaporating the solution till the salt crystallizes. Its crystals are usually thin brilliant plates, resembling mother-of-pearl, which easily adhere together, and acquire a kind of gluey consistency. Its taste is strongly acid. Water dissolves it, and in a greater proportion when boiling hot than when cold. Hence a saturated solution of it in boiling water crystallizes on cooling. It attracts a little moisture when exposed to the air. When heated, it readily undergoes the watery fusion, then swells up and dries. In a high temperature it melts into a semitransparent glass, which is tasteless and insoluble, and is not altered by exposure to the air. When this salt is heated to redness along with charcoal, its excess of acid is decomposed, and converted into phosphorus, and phosphat of lime remains behind. It is from this salt that phosphorus is usually obtained; but the process of Fourcroy, which consists in decomposing the superphosphat of lime by means of acetat of lead, and afterwards decomposing the phosphat of lead by means of charcoal, must yield a much greater proportion of phosphorus.

No acid hitherto tried is capable of decomposing this salt, except the oxalic, which abstracts its base completely, and precipitates with it in the form of oxalat of lime; but it is decomposed and reduced to the state of phosphat of lime by all the

PHOSPHATE.

alkaline and earthy bases. It is composed, according to the analysis of Fourcroy and Vauquelin, of

54 acid
46 lime

100.

4. *Phosphat of potass.* Of this salt there are two varieties; the first, which contains an excess of acid, and is in reality a superphosphat, has been long known, and appears to have been first mentioned by Lavoisier, in 1774; but it is to Vauquelin that we are indebted for an examination of its properties. The second, which is a neutral salt, was lately discovered by Darraeq. It had been formed, indeed, previously by Guyton Morveau and Desormes; but these gentlemen had mistaken it for phosphat of lime.

Superphosphat of potass is prepared by dropping carbonat of potass into phosphoric acid till all effervescence ceases, and then evaporating to the proper consistency. It does not crystallize. When evaporated sufficiently, it assumes the form of a jelly; and if the evaporation is carried farther, it becomes dry altogether. Its specific gravity, when dry, is 2.85. It is exceedingly soluble in water, and when dry readily attracts moisture from the atmosphere, and is converted into a viscid liquid. When heated, it first undergoes the watery fusion; then allows its water of crystallization to evaporate, and is reduced to dryness. In a high temperature it melts into a transparent glass, which deliquesces again when exposed to the air.

It is completely decomposed by the sulphuric, nitric, and muriatic acids; and by barytes, strontian, and lime.

6. *Phosphat of potass, proper.* This salt may be formed by mixing together superphosphat of potass and pure potass, and exposing them to a strong heat in a platinum crucible. A white coloured substance is obtained, which is the phosphat in question. This salt is tasteless, and insoluble in cold water, but soluble in hot water, and it precipitates as the solution cools in a gritty brilliant powder. It is extremely fusible; melting before the blowpipe into a transparent bead, which becomes opaque on cooling. It is soluble in nitric, muriatic, and phosphoric acids; the solutions are thick, glutinous, and adhesive. When sufficiently diluted, the alkalies occasion no precipitate in these solutions; but when they are concentrated, a precipitate appears.

5. *Phosphat of soda.* This salt exists ready formed in urine, and was the first known of all the phosphats. It occupied a good deal of the attention of chemists; and the difficulty of analysing it gave occasion to various hypotheses concerning its nature. Hellot remarked it in urine; and described it in 1737, as a salt different from those that had usually been observed. Haupt described it in 1740 under the name of *sal mirabile perlatum*, or "wonderful perlated salt." It was called perlated from the grey, opaque, pearl-like colour which it assumed when melted by the blowpipe. Margraff examined it in 1745, and found it would not yield phosphorus when treated with charcoal, as the other salts of urine did.

Dr. Pearson afterwards introduced it with great advantage into medicine as a purgative. He gives the following process for preparing it: Dissolve, in a long-necked matrass, 1400 grains of crystal-

lized carbonat of soda, in 2100 grains of water, at the temperature of 150 degrees. Add gradually 500 grains of phosphoric acid of the specific gravity 1.85. Boil the liquor for some minutes, and while it is boiling hot, filtrate it, and pour it into a shallow vessel. Let it remain in a cool place, and crystals will continue to form for several days. From the above quantities of materials he has obtained from 1450 to 1550 grains of crystal.

Its crystals are rhomboidal prisms, of which the acute angles are 60 degrees, and the obtuse angles 120 degrees, terminated by a three-sided pyramid. Its specific gravity is 1.333. Its taste is almost the same with that of common salt. It is soluble at the temperature of 60 degrees in about four parts of water, and in two parts of boiling water. This solution crystallizes on cooling; but in order to obtain the salt properly crystallized, the solution should contain a slight excess of alkali. When exposed to the air, this salt very soon effloresces on the surface. When heated, it undergoes the watery fusion. At a red heat it melts into a white enamel. Before the blowpipe it melts into a transparent globule, which becomes opaque on cooling, and its surface acquires a polyhedral figure. It is not altered by combustibles nor metals. With metallic oxyds it enters into fusion, and forms a coloured globule of glass. Sulphuric, nitric, and muriatic acids decompose it partially, and convert it into superphosphat of soda. In this state it is more soluble in water, and not so easily crystallized; but may be obtained, by proper evaporation, in a state of thin scales, not unlike boracic acid.

The greater number of earths may be fused along with this salt, and converted into glass.

This salt has been applied to various uses. It has been introduced into medicine as a purgative, and on account of its pleasant taste has of late been much used. It is usually taken in broth, which it is employed to season instead of common salt. It may be substituted for borax, to promote the soldering of metals. Mineralogists employ it very much as a flux, when they examine the action of heat on minerals by means of the blowpipe.

6. *Phosphat of ammonia.* This exists also in urine, and seems to have been first accurately distinguished by Rouelle. It is usually prepared by saturating with ammonia the superphosphat of lime obtained from bones, and evaporating the solution to such a consistency, that when allowed to cool, the phosphat of ammonia is obtained in crystals.

It crystallizes in four-sided prisms, terminated by equal-sided pyramids. Its taste is cooling, salt, and ammoniacal. Its specific gravity is 1.80. It is soluble in four parts of water at the temperature of 60 degrees, and in rather a smaller proportion of boiling water. It is by spontaneous evaporation that it is obtained in the state of regular crystals. It is not altered by exposure to the air. When heated, it undergoes watery fusion; it then dries, but if the heat is continued, it swells up, loses its alkaline base, and the acid melts into a transparent glass. It is the only one of the earthy and alkaline phosphats which can be decomposed by heat. Hence the reason that it yields phosphorus when distilled along with charcoal.

It is decomposed by the sulphuric, nitric, and muriatic acids, and by the fixed alkalies and alka-

PHOSPHAT.

fine earths. It is capable of combining with an additional dose of acid, and of passing into the state of a superphosphat.

This salt is much employed as a flux in experiments with the blowpipe. It enters also as an ingredient in those coloured glasses called pastes, which are made in imitation of precious stones.

7. *Phosphat of magnesia.* It is usually prepared by dissolving carbonat of magnesia in phosphoric acid, and evaporating the solution gradually till the salt crystallizes; but it may be obtained in large regular crystals by a much easier process. Mix together equal parts of the aqueous solutions of phosphat of soda and sulphat of magnesia. No apparent change takes place at first; but in a few hours large transparent crystals of phosphat of magnesia make their appearance in the solution.

Its crystals are six-sided prisms, the sides of which are unequal. It has very little taste; however, it leaves a cooling and sweetish impression upon the tongue. Its specific gravity is 1.55. It requires about 15 parts of cold water to dissolve it. It is more soluble in boiling water, but it crystallizes in part as the solution cools. When exposed to the air, it loses its water of crystallization, and falls down in powder. When heated moderately, it is also reduced to a dry powder. In a high temperature it melts into a transparent glass.

8. *Phosphat of glucina.* It is obtained by pouring phosphat of soda into the solution of glucina in sulphuric, nitric, or muriatic acids. The phosphat of glucina is precipitated in the state of a white powder. It does not crystallize. It is tasteless, insoluble in water, unless it contains an excess of acid, and not liable to be altered by exposure to the air. When heated strongly, it melts into a transparent glass.

9. *Phosphat of yttria.* When the solution of phosphat of soda is mixed with the sulphat, nitrat, or muriat of yttria, phosphat of yttria precipitates in gelatinous flakes.

10. *Phosphat of alumina.* It may be formed by saturating phosphoric acid with alumina. It is a tasteless powder, insoluble in water. Dissolved in phosphoric acid, it yields a gritty powder, and a gummy solution, which by heat is converted into a transparent glass.

11. *Phosphat of soda and ammonia,* known to chemists by the names of microcosmic salt, and fusible salt of urine, was extracted from urine, and examined much sooner than any of the other phosphats: it was long before philosophers were able to form precise notions concerning its nature, or even to obtain it in a state of purity. This, indeed, could not be expected till the phosphats of soda and of ammonia had been accurately examined, and their composition ascertained. Fourcroy was the first who gave a precise account of the proportion of its component parts. According to him, it is composed of

32 acid
24 soda
19 ammonia
25 water

100.

The properties of this salt are nearly those of the phosphat of soda and phosphat of ammonia joined together. It answers better than the first of them as a flux; because the heat soon drives off the ammonia, and leaves an excess of acid. Its specific gravity is 1.5. When exposed to the air, this salt effloresces, and gradually loses its ammonia.

12. *Phosphat of ammonia and magnesia* was first discovered by Fourcroy, who found it in a calcareous concretion, formed in the colon of a horse. Since this discovery, Fourcroy and Vauquelin have observed it also in human urine.

It might be prepared by mixing together solutions of the phosphats of ammonia and of magnesia in water; the triple salt immediately precipitates in the state of a white powder. When urine is allowed to remain a considerable time in close vessels, it often deposits this salt in regular crystals on the sides and bottom of the vessel. These crystals are small four-sided prisms, terminated by irregular four-sided pyramids. This salt is tasteless, scarcely soluble in water, and not liable to be altered by exposure to the air. When heated it falls to powder, gives out its ammonia, and in a high temperature melts into a transparent globule. It is composed of

33 phosphat of ammonia
33 phosphat of magnesia
33 water

99.

Phosphoric acid and silica, when mixed together and exposed to a strong heat, melt into a beautiful transparent glass, which is not decomposed either by the action of acids or of alkalies. Fourcroy has given this compound the name of phosphat of silica; but it is essentially different from salts, and ought, therefore, rather to be ranked among some other class of bodies.

PHOSPHITES, or those salts that are formed with the phosphorous acid united to the earths, alkalies, and metallic oxyds, may be distinguished by the following properties: 1. When heated they emit a phosphorescent flame. 2. When distilled in a strong heat, they give out a little phosphorus, and are converted into phosphats. 3. They detonate when heated with nitrat or oxy muriat of potass, and are converted into phosphats. 4. They may be converted into phosphats by nitric and oxy muriatic acid. 5. They are fusible in a violent heat into glass.

The phosphites at present known amount to eight:

1. *Phosphite of lime.* This salt may be formed by dissolving lime in phosphorous acid. When the saturation is complete, the salt precipitates in the state of a white powder. It is tasteless and insoluble in water; but it dissolves in an excess of acid, and forms a superphosphite. This last salt may be obtained in prismatic crystals, by evaporating the solution. It is not altered by exposure to the air. When heated, it phosphoreces and emits a little phosphorus. In a violent heat, it melts into a transparent globule.

It is composed of 34 acid
51 lime
15 water

100.

2. *Phosphite of barytes* may be formed by pouring phosphorous acid into barytes water, or this last water into a solution of phosphite of soda. In either case, phosphite of barytes precipitates in the form of a white powder. It is tasteless, and but very sparingly soluble in water, unless there is an excess of acid. It is not altered by exposure to the air. Before the blowpipe it melts, and is surrounded with a light so brilliant, that the eye can scarcely bear it. The globule which it forms becomes opaque as it cools.

P H O

It is composed of 41.7 acid
51.3 barytes
7.0 water

100.0.

3. *Phosphite of magnesia* is best formed by mixing together aqueous solutions of phosphite of potass or soda and sulphat of magnesia; the phosphite of magnesia gradually precipitates in beautiful white flakes. It has no sensible taste. It is soluble in 400 parts of water at the temperature of 60 degrees, and scarcely more soluble in boiling water. When its solution is evaporated slowly, a transparent pellicle forms on its surface, flakes are deposited, and towards the end of the process, small tetrahedral crystals are precipitated. When exposed to the air, it effloresces. When heated, it phosphoresces and melts into a glass, which becomes opaque on cooling.

It is composed of 44 acid
20 magnesia
36 water

100.

4. *Phosphite of potass.* This salt is formed by dissolving carbonat of potass in phosphorous acid, and evaporating the solution slowly till it deposits crystals of phosphite of potass. It crystallizes in four-sided rectangular prisms, terminated by dihedral summits. Its taste is sharp and saline. It is soluble in three parts of cold water, and still more soluble in boiling water. It is not altered by exposure to the air. When heated, it decrepitates, and then melts into a transparent globule, which becomes opaque on cooling. It does not phosphoresce so evidently as the other phosphites, perhaps because it contains an excess of potass, which saturates the phosphoric acid as it forms.

It is composed of 39.5 acid
49.5 potass
11.0 water

100.0.

5. *Phosphat of soda* may be prepared exactly in the same way as phosphite of potass. Its crystals are irregular four-sided prisms, or elongated rhomboids. Sometimes it assumes the form of square plates, or of plumose crystals. Its taste is cooling and agreeable. It is soluble in two parts of cold water, and scarcely more soluble in boiling water. When exposed to the air it effloresces. Before the blowpipe, it emits a beautiful yellow flame, and melts into a globule, which becomes opaque on cooling.

It is composed of 16.3 acid
23.7 soda
60.0 water

100.0.

6. *Phosphite of ammonia* may be prepared by the same process as the two last described phosphites. It crystallizes sometimes in long transparent needles, and sometimes in four-sided prisms terminated by four-sided pyramids. It has a very sharp saline taste. It is soluble in two parts of water, at the temperature of 60 degrees, and still more soluble in boiling water. When exposed to the air, it attracts moisture, and becomes slightly deliquescent. When distilled in a retort, the ammonia is disengaged partly liquid and partly in the state of gas, holding phosphorus in solution,

P H O

which becomes luminous when mixed with oxygen gas. Before the blowpipe on charcoal, it boils, and loses its water of crystallization; it becomes surrounded with a phosphorescent light; and bubbles of phosphureted hydrogen gas are emitted, which burn in the air with a lively flame, and form a fine coronet of phosphoric acid vapour. This gas is emitted also when the salt is heated in a small glass bulb, the tube belonging to which is plunged under mercury.

This salt is composed of 26 acid
51 ammonia
23 water

100.

7. *Phosphat of ammonia and magnesia.* This salt may be formed by mixing together the aqueous solutions of its two component parts. It is sparingly soluble in water, and may be obtained in crystals; but its properties have not been examined with precision.

8. *Phosphite of alumina* may be prepared by saturating phosphorous acid with alumina, and then evaporating the solution to a proper consistence. It does not crystallize, but forms a glutinous mass, which dries gradually, and does not afterwards attract moisture from the air. Its taste is astringent. It is very soluble in water. When heated it froths, and gives out phosphorus, but it does not readily melt into a globule of glass.

Hitherto none of these salts have been applied to any useful purpose. It hence appears, therefore, that phosphites are salts formed by the combination of the phosphorous acid with different bases.

PHOSPHORESCENCE. Light thrown forth from substances that at the same time emit little or no heat at the common temperature of the atmosphere, and which are denominated phosphoric.

The phosphorus properly so called, and which is usually understood in chemical books, and employed in chemical processes, is that commonly known by the name of Kunckel's phosphorus, and which we shall describe under that designation. But there are various other substances that possess, in different degrees, the same kind of illuminating power, and which it is hence necessary to take some notice of, as well as of the effects they produce.

Of these kinds of phosphorescent substances there are three leading divisions. The first comprehends those which require a previous exposure to the solar or other light, in order to become luminous; whence they are called solar phosphori: the second includes those which, without any necessary previous exposure to light, become luminous when moderately heated, which are denominated calorized phosphori; or phosphori from heat: the third comprehends those substances belonging to the animal and vegetable kingdoms, which emit light spontaneously at the common temperature, without the necessity of a previous exposure to light, and these are called spontaneous phosphori.

Solar phosphori.

A casual discovery by Vincenzio Cascariolo, a shoemaker of Bologna, about 1630, was the first circumstance that attracted the notice of philosophers to this curious subject. This man being in quest of some alchemical secret was induced to calcine a parcel of Bolognian spar (a subspecies of

PHOSPHORESCENCE.

heavy spar or native sulphat of baryte), which he had procured from Monte Paterno, in the neighbourhood of the city; and observed, that whenever this substance, thus prepared, was placed in a dark room, after having been exposed to the sun, it continued to emit faint rays of light for some hours afterwards.

In consequence of this interesting discovery, the Bolognian spar came into considerable demand among natural philosophers, and the curious in general, so that the best way of preparing it was found an object of some pecuniary importance. This seems to have been hit upon by the family of Zagoni, who supplied all Europe with Bolognian phosphorus, till the discovery of more powerful phosphoric put an end to their monopoly. Margraaf, some years afterwards, proved that other species of sulphated baryte might, under particular management, be made to produce a similar effect.

In the year 1677, nearly half a century after the discovery of the Bolognian phosphorus, G. A. Baldwin, a native of Misnia, observed that if nitrat of lime were evaporated to dryness, and then formed into a compact mass by fusion at a red heat, it would exhibit the same property of imbibing and emitting light as the former, only somewhat inferior in degree: hence this preparation obtained the name of Baldwin's phosphorus.

In 1730, M. du Fay, who is justly celebrated for his electrical researches, directed his attention to this subject, and observed, that all earthy substances susceptible of calcination, either by mere fire, or when assisted by the previous action of nitrous acid, possessed the property of becoming more or less luminous when calcined and exposed for a short time to the light: that the most perfect of these phosphori were limestones, and other kinds of carbonated lime, gypsum, and particularly the topaz; and that some diamonds were also observed to be luminous by simple exposure to the sun's rays, without being previously ignited; while flint, sand, jasper, agate, and rock crystal, were inphosphorescent.

Not long after, M. Beccaria discovered that a great variety of other bodies were convertible into phosphori, by exposure to the mere light of the sun; not only the varieties of carburet and sulphat of lime, but organic animal remains, and geodes lined with minute crystals of quartz; most compound salts, when clear and crystallized, particularly Glauber's, nitre, and borax, were also found to be phosphorescent: of vegetable substances all the farinaceous and oily seeds, all the gums and several of the resins, the white woods, and vegetable fibre, either in the form of paper or linen; also starch and loaf-sugar proved to be good phosphori, after being made thoroughly dry, and exposed to the direct rays of the sun. Sundry animal matters, by a similar treatment, were also converted into good phosphori, particularly bone, either fresh or calcined, sinew, glue, hair, horn, hoof, feathers, and fish shells. The same property, he observed, might be communicated to rock-crystal, and some of the gems, by rubbing them against each other, so as to roughen their surface, and then placing them for some minutes in the focus of a lens, by which the rays of light were concentrated upon them at the same time that they were also moderately heated.

In the year 1763, Mr. Canton contributed some important facts relative to solar phosphori, and communicated a method of preparing a very power-

ful one, which, after the inventor, is usually called Canton's phosphorus. It is thus made: calcine oyster-shells in the open fire for half an hour; then select the whitest and largest pieces, and mix them with flowers of sulphur in the proportion of one part of the latter to three parts of the former; pack the whole closely into a crucible; lute on a cover, and heat it pretty strongly for one hour; when the crucible has again become quite cold, turn out its contents, and select the whitest pieces for use. Mr. Canton affirms, that his phosphorus, inclosed in a glass flask, and hermetically sealed, retains its property of becoming luminous for at least four years, without any apparent decrease of activity.

Mr. Wilson found that a much greater brilliancy of colour would be produced by letting the oyster-shells come in direct contact with the burning coals, or other inflammable matter, and by being covered with it; and that if the covering matter be iron, the luminousness will be very bright; if steel, still brighter and more iridescent; but if plates of charcoal, most so of all.

If a common box smoothing iron, heated in the usual manner, be placed for half a minute on a sheet of dry, white paper, and the paper be then exposed to the light, and afterwards examined in a dark closet, it will be found that the whole paper will be luminous, that part however on which the iron had stood being much more shining than the rest.

Colorized phosphori.

Besides those substances that are phosphorescent by exposure to the rays of the sun, there are others which give out light when simply heated. These materially differ from the former in this circumstance, that after having been continued at any particular temperature till their luminousness is exhausted, they are incapable of becoming again luminous, except at a greater heat than that to which they were first subjected. The range of temperature at which these bodies become luminous is not very extensive, commencing at about 400° Fahr. and terminating at the lowest visible red heat. The following is a list of substances exhibiting this, properly arranged by Mr. S. Wedgwood, according to the brilliancy of the light.

That variety of the blue fluor spar of Derbyshire, which, when scraped or struck, emits a fetid, bituminous odour, is the most phosphorescent by heat of all the known substances: it glows, when moderately heated with a pale emerald green light, sufficiently intense to be very visible even in daylight. To the second rank belong the common swine-stone, the common blue fluor, and red felspar, all which, as well as the following, exhibit a white or reddish light. The third class includes the diamond, the ruby, carbonated baryte, chalk, colourless calcareous spar, sea-shells, granite, and white fluor. The fourth class comprehends white sand, carbonated magnesia, heavy spar, flint, white marble, quartz, porcelain, and earthenware. The fifth class includes most of the metals, sulphat of potash, borax, white paper, white linen, sawdust, and asbestos. Under the sixth and last class are comprehended oil, wax, spermaceti, and butter when boiling or nearly so. Most of these are also phosphorescent by friction.

Spontaneous phosphori.

There are many animals, and especially belonging to the insect and worm classes, that give forth a considerable quantity of light in the dark, while

PHOSPHORESCENCE.

alive and in health. Such are the common glow-worm, the fire-flies of America and of Italy, the fulgora of China, and the elater among the former, to which also we may add the cancer fulgens, a species of crab; and such, among the latter, are a few shell-fishes, some of the marine molluscs, the pyrosoma, the phloas, and various others, which will be found enumerated in the article LUMINOUS ANIMALS: many of which appear to have a power of secreting this phosphorescence at their will.

But besides these, there are various animals, and animal substances, and some vegetable substances, that emit light after death, without any aid derived from exposure to solar light, heat, or combustion of any kind. Generally speaking, this phosphorescence in animals makes its appearance before the commencement of putrefaction, and ceases when the latter is completely established. These animal substances are chiefly the flesh of the carp and various other water-fishes, of the tadpole, but not of the frog; but especially the flesh of salt-water fishes, which is peculiarly rich in phosphorescent matter. Of vegetable matters that become luminous, the principal is decayed wood: peat also, though very rarely, has exhibited a similar appearance. The chief observers who have turned their attention to this subject are Mr. Boyle, Mr. Canton, and Dr. Hulme.

The only laboratory required for these processes is a dark room, and the only preparation of the fish is that he should be gutted and split, and his scales taken off. The herring seems to afford more light than any other fish. The time which sea-fishes, as fresh as they can commonly be procured in a market, take to become luminous is about twelve hours: the phosphorescence is faint and partial at first, but soon spreads over the whole surface, and becomes very bright before putrefaction ensues; after which it gradually becomes more faint, but does not entirely disappear in less than four or five days: the luminous matter may be scraped off with a blunt knife, and will continue to shine for a considerable time. The production of this phosphoric light does not afford any heat ascertainable by the thermometer. By exposure to a freezing temperature, the light is rendered latent, and is wholly destroyed when plunged into boiling water; yet warmth to a certain extent obviously increases its brilliancy. It cannot be produced except by the contact of atmospheric air; yet when once excited, it is not increased by being placed in oxygen gas, or impaired by azot.

This light has by some philosophers been conceived to be derived from the sun; and by others to be a substance of a peculiar kind. To this last opinion M. Dessaignes is strongly inclined, who has lately presented a very long and elaborate memoir upon the subject to the French national institute, and in which he has endeavoured to examine minutely into its mode of action. His memoir, which is divided into five parts, has excited much attention on the continent, and as such we are compelled to notice it. The author first defines phosphorescence to be "an appearance of light, durable or fugitive, not sensibly containing any heat, and without any subsequent alteration in inorganic bodies." He distinguishes four kinds of phosphorescence, viz. phosphorescence by the temperature being raised, that which bodies exhibit when exposed to the light or to electrical discharges, that which arises from percussion, from pressure, or from friction, and last of all, spontaneous phosphorescence.

The author recognised the first of these various modes of phosphorescence in almost all bodies presented to us by nature, with but very few exceptions. For this purpose he placed them on a metallic stalk in a dull heat, in order that the lustre of a red-hot support might not hinder him from observing the phosphoric light in bodies in which it shines but feebly. He made his experiments on bodies which light renders phosphorescent in a dark room, furnished at the side exposed to the sun with a small trap-door, which opened and shut at pleasure. Exposure to the rays of the sun for a few seconds is sufficient for exhibiting the shining of these bodies, the instant we intercept them, with all the brilliancy of which they are susceptible. The light which they give out in this case is, in general, in an inverse ratio to their degree of humidity: but they do not lose entirely this kind of phosphorescence, except when they are mixed with a quantity of water sufficient for holding them in solution, or when they themselves pass to the liquid state. The third kind of phosphorescence, which may be, generally speaking, called phosphorescence by collision, supposes a texture of a gravelly rather than of a glassy nature, and we do not obtain it at its highest degree, except by the contact of a body of one and the same species, or of a still harder body. It also supposes the hardness of the constituent molecules, but it is not necessary that they should be strongly united together: thus, sugar, in which the molecules feebly adhere, is, as we know, very phosphorescent upon collision.

Spontaneous phosphorescence is presented during certain combinations, wherein the molecular action is energetic, like that which combines lime and water, the phosphorescence lasts but a few seconds, and the slower the combination takes place, it is the more permanent: this happened in the case of all the woods which the author submitted to experiment, whether they were growing or cut down. They become equally shining in both cases when they are penetrated with humidity, in contact with the atmospheric air, and at a temperature of 8 or 10° of the centigrade thermometer.

The principal facts ascertained by M. Dessaignes, relative to these four kinds of phosphorescence, are as follows. So far from the phosphoric light being regarded as a consequence of the incandescence of the supporter, it disappears completely in the case of various bodies, which shine very well on a support heated merely to 200°. Bodies which are phosphorescent at an elevation of temperature are equally so on metallic supporters, on those which are bad conductors of caloric, like glass or porcelain, and in boiling mercury or even in water, when substances are acted upon which require a temperature of 100° only to shine. The fluat of lime, the phosphat of lime of Estremadura, and the adular stone in powder, shine at 100° or 112° of the centigrade thermometer: glass, sand, porcelain, and in general all the vitreous stones, do not shine completely except at 375°. All bodies which are phosphorescent at an elevated temperature require middle degrees of heat between these two extremes: the whole shine more or less at 256°, a temperature determined by the fusion of bismuth.

Many of the experiments seem to prove that the light which escapes is in a direct ratio with the degree of temperature, and its duration in an inverse ratio. A substance which, like fluat of lime, shines well at a low temperature, ceases to possess

PHOSPHORESCENCE.

this property if it have previously undergone a stronger heat: but it preserves that of becoming luminous on a body still hotter. The same substance subjected several times successively to a temperature of 300° gave a fine light, which lasted at the first projection $30''$, at the second $15''$, and at the third $10''$. Fifteen other successive projections gave a light of the same duration and intensity as the fourth. Vitreous bodies lose their phosphoric properties with great difficulty: for this purpose they must be calcined strongly for half an hour, or even an hour, while all the metallic bodies, their phosphorescent oxyds, and all the metallic salts, lose it on the first projection in an iron spoon slightly heated. Lime, barytes, strontian, magnesia, alumine, and silex, cannot lose their phosphoric property, whatever may be the degree of heat to which they are subjected. These earths heated at first to 100° or 125° , do not omit any light on a support heated to 250° , whereas they shine well if thrown upon it cold. The carbonats of lime, barytes, and strontian, lose their phosphorescence upon a moderate calcination, and resume it afterwards if we calcine them to whiteness for half an hour, which seems to arise from their then passing partly to the state of caustic alkaline earths. All the earthy or alkaline salts lose their phosphorescence upon calcination: those which are soluble resume it in proportion to their solubility, when they remain exposed to the air, particularly if humid. The insoluble salts, in the same way as quartz, adular, glass, &c. lose it entirely. The vegetable and animal substances lose it in the same way, but only when reduced to the state of charcoal.

M. Dessaignes has ascertained, that the most phosphorescent bodies are those, in the composition of which some of their elements have passed from the gaseous or liquid to the solid state. He remarks that the light of phosphorescence is, like every other, decomposable by the help of a prism into rays of various colours. It is of itself coloured generally in blue in all the phosphorescent bodies which do not contain metallic oxyds, and becomes so in bodies which contain them; like the powder of calcined bones, the light of which is yellow, the phosphat of lime of Estremadura, and the green fluat of lime, which present a green light, when we free them from the oxyds which they contain, by dissolving them in the muriatic acid, and precipitating them with ammonia.

The phosphorescence of mineral substances undergoes no variation on inserting them into the various gasses, which proves that it is not the result of a combustion. That of vegetable and animal matters becomes brisker, on the contrary, in oxygen, and disappears in azote, hydrogen, and carbonic acid: nevertheless, linsed oil obtained by pressure, and heated in a vacuum or carbonic acid, at 125° , becomes sensibly luminous; but when this light has disappeared, it remains constantly obscure while it is in the same circumstances. When heated in the open air nearly to ebullition, it burns with a shining light, of a quite different nature, since it is extinguished in the carbonic acid, and is revived in the atmospheric air. The first of these phosphorescences is analogous to that of mineral substances, the second is a true combustion. All the metallic oxyds made by calcination are inphosphorescent, at least if they have not passed to the state of semi-vitrification. Those which we obtain by the humid way lose their phosphorescence by drying them on a filter above burning coals. The phosphat of mercury

resists a little longer; but when the filtering paper begins to turn red, there arises a mass of light, after which it remains dark like the rest. All bodies which have too great a quantity of water in their composition are inphosphorescent. Slaked lime is very luminous in dry, and very dull in damp weather. The concrete carbonat of lime only gives a few sparks, that of primitive formation is very phosphorescent at an elevated temperature. All substances which are melted or softened on the heated supporter remain obscure. Many mixed substances which do not soften at 256° , and which shine very well at this degree of heat, become obscure as soon as the temperature is high enough for the particles to be disunited. The facility with which the acidulated salts, with the exception of the borates, enter into fusion, renders them inphosphorescent. The acid tartrite of potash shines, however, but only by the combustion of its vegetable principles. The volatile salts manifest the same inphosphorescence. Lastly, those which contain a great quantity of metallic oxyds not dissolved, but mixed with their substance, do not exhibit any phosphorescence. In general, the substances which attract humidity very strongly do not shine except when they are united to a less quantity of water than that which could saturate them, or, as is commonly said, slake them completely; but it is not requisite that they should be totally deprived of it. The author particularly observed the influence of this circumstance on the phosphorescence produced by the alkaline earths in contact with concentrated sulphuric acid. Small pieces of caustic barytes, as dry as it was possible to procure them, emit no light when thrown into this acid, and are not at first dissolved in it. When moistened by the breath simply, they give out light at the moment of touching the acid, and are converted into sulphate of barytes. When too much moistened, they again become dull. Lime and strontian exhibit the same phenomena. According to this remark as to the quantity of water necessary to phosphorescence, M. Dessaignes made sulphats and muriats of soda and of potash and fluat of lime, deprived of all phosphorescence, because they contained no water, by using alcoholic solutions, instead of aqueous solutions, in the ordinary operations of precipitations or double decompositions which give birth to these salts. It is to be remarked, that the salts which have lost by calcination their phosphorescence, with the water which they contained, take up part of it again, after having undergone igneous fusion. It is the same with glass and metallic scales become dull by calcination, which shine once more on the warm supporter after having been fused.

The examination afterwards entered into of the relations between electricity and phosphorescence, by elevation of temperature, presents facts of great interest. Among the metallic powders, those of zinc and antimony are the most phosphorescent, and those of gold and silver are least so. All of them, when prepared in damp weather, with all the precautions most proper for making them shine, are inphosphorescent, as well as the metallic oxyds. In dry weather the contrary is the case. Antimony, even in very dry weather, loses its phosphorescence, if it be pounded and strongly rubbed against a metallic mortar. In an insulated vessel, it acquires a high degree of phosphorescent properties. Glass pounded in dry weather is more luminous than when the operation has been performed in a damp atmosphere. It loses almost all its phosphorescence when pounded in wet linen;

PHOSPHORESCENCE.

but it does not lose it, like antimony, when the operation is performed in a metallic mortar, because there is no transmission of the electrical fluid. It is not the case with adular spar, the powder of which does not retain a fine phosphorescence, unless it has been prepared in an insulating mortar. In all cases where a vessel of this nature has been employed, the author took care to use one with an insulating pestle. In the last place, glass rendered dull by calcination resumes all its phosphorescence when exposed on an insulating supporter between the two balls of an electrical excitator, after it has received four or five electrical discharges. This method equally succeeds with every substance which has lost its phosphorescence by calcination. There is not even a necessity for a discharge, and we restore phosphorency to calcined adular, for example, by a simple current of electricity, determined by a conductor terminated in a point, and which is passed through this substance reduced to a liquid paste, with a quantity of water sufficient for leaving an easy passage to the electric fluid. After three or four minutes of electrization, this paste, afterwards dried spontaneously, yielded a very phosphorescent powder on the hot supporter. What is most remarkable in this way of restoring phosphorescence to bodies which have lost it by calcination, is, that it never re-establishes it in those which have been deprived of it by exposure to the light of the sun.

M. Dessaignes next makes inquiries as to the phosphorescence produced by light or by electricity. He first refutes the opinion of a great number of persons, as to the cause of the lustre which is preserved during a longer or shorter period by bodies exposed to the light of the sun. The sulphuret of lime, known by the name of Canton's phosphorus, the dried nitrat of lime, glucine, and Bolognian phosphorus, after having been hit by red rays only, shone with precisely the same yellow, white, green, and reddish colours, which they afforded when exposed to the ordinary light of the sun. The same thing took place after their exposure to the light of each ray of the solar spectrum, or to that of coloured flames; and what confirms the idea that these phenomena are not owing, as has been supposed, to the imbibition of light by the phosphorescent substance, is, that Canton's phosphorus, prepared without having experienced in any shape the contact of light, shines equally upon a heated supporter, or even by the simple heat of the hand. This phosphorus shines, on exposure to the light of the moon or to that of a lamp. The light of the moon is not sufficient for Bolognian phosphorus, which takes fire, however, on being exposed to the light of a lamp with a stream of air. Most of the other phosphorescent substances require the light of the sun. It is sufficient, even after having been reflected, for several salts: but cat's eye, hyoline quartz, and phosphat of Estremadura lime, do not shine until after having been exposed to the direct light. Other substances, such as zircon, ruby, cymophane, and other vitreous stones, absolutely resist the action of the light, even when it is concentrated in the focus of a burning mirror.

The general result of the experiments made upon a very great number of bodies exposed to the light of the sun, seems to determine that those which are demi-conductors of the electric fluid are all susceptible of taking fire by these means; that isolating bodies do not shine equally, some of them doing so feebly, or with difficulty, and the rest not at all. Lastly, that bodies which are conductors

remain dull; and this happens to the metals, to charcoal, to carburet of iron, to all the sulphurets and metallic oxyds, with the exception of orpiment, the semi vitreous oxyds of arsenic and tin, and those of zinc and lead made in the humid way. Among the metallic salts, the author has only found that the muriate of tin, the sulphat and the phosphat of lead, shine after being exposed to the sun.

A remarkable difference between the inphosphorescence which insulating bodies and good conductors present, either in the light, or when subjected to feeble electrical discharges, while all the demi-conductors shine by these two methods, consists in the faculty which the former have of becoming luminous after very strong discharges; the latter remain constantly dull, however strong the explosions may be.

When bodies have been calcined until they have become inphosphorescent, either upon a heated supporter, by exposure to the light, or by a first electrical shock, the two first methods cannot restore their phosphorescence; but they resume it by reiterated discharges, and then they again become equally sensible as formerly to heat, light, and a single electrical discharge.

Various experiments seem to prove, that these three modes of phosphorescence increase or diminish by the same circumstances. Thus, the sulphat of soda, subjected to the action of light and to that of electricity in four different states, crystallized, deprived of half its water of crystallization, of three-fourths of it, and entirely calcined, burnt for the same length of time, whether the phosphorescence was excited by the shock of the light, or by that of electricity: viz. in the first instance during 6", in the second 8", in the third 200", in the last 4" only, and with a very feeble light. Sulphat of potash rendered inphosphorescent by calcination, thus deprived of its water of crystallization, and immediately inclosed in a tube furnished with excitators, resumed, after five or six electrical discharges, the property of shining by isolation, as it did before being calcined: hence we may conclude, that the complete desiccation of phosphorescent substances does not deprive them of this property, except by rendering them less susceptible of permitting the passage of the electric fluid, and not because a small quantity of water is indispensable for the production of this phenomenon.

In phosphorescence excited by collision all bodies susceptible of shining are, with very few exceptions, luminous on the heated supporter, by exposure to light and by electrization. This property also diminishes in proportion as bodies are more or less completely calcined: nevertheless glass, calcined until it has become inphosphorescent by every other method, also emits a brisk light under the action of the file; but in order to produce this effect, the friction must be much stronger than before calcination. This kind of phosphorescence, which takes place like the foregoing in vacuo, and in the irrespirable gasses, seems besides, from the whole phenomena, to be produced by the same cause. This is attributed to the oscillations of a particular fluid, which heat, light, electricity, and a blow or friction put in motion; while calcination, or a long exposure to the light, drives it from bodies which are exposed to it: but we do not find, on this hypothesis, how strong electrical discharges reproduce the phosphorescence, unless this fluid and the electrical fluid are one and the same. The author thinks this opinion ought to be rejected,

PHOSPHORIC ACID.

because we perceive no sign of electrical attraction, or repulsion, in bodies which have recovered in this way the phosphorescence which they had lost, and because it is excited by an electrical discharge in various bodies plunged under water. But if we recollect that water is a very bad conductor of the electrical fluid, and that we are but imperfectly acquainted with the various modifications of which this fluid is susceptible, and the cause of the brilliant light which it gives in vacuo, we may naturally look for new facts, before we decide that the fluid of phosphorescence is essentially different from that to which we ascribe the phenomena of electricity.

In examining the spontaneous phosphorescence of animal and vegetable substances, the author concludes from his experiments, that it is owing to a true combustion, in which water and carbonic acid are formed; as we easily ascertain the presence of this acid in the residuum by means of lime-water. Wood loses more than half its weight before ceasing to shine. This phosphorescence is not extinguished until after some time in the irrespirable gasses, but this is on account of the air contained in the pores of the phosphorescent substance, and the presence of which is easily ascertained by putting this substance in water under the receiver of the pneumatic machine. In proportion as the air escapes, the phosphorescence diminishes, and soon disappears entirely. M. Dessaignes ascertained that this air, already vitiated, only contains about three-fifths of the oxygen of an equal volume of atmospheric air.

This kind of phosphorescence is destroyed without remedy, by immersion in boiling water: it is suspended in water at 50° , and at the freezing temperature: it subsists from 6° to 37° .

The author having put a piece of phosphorescent fish in a saline solution, favourable to phosphorescence, but which had been previously deprived of air by ebullition, found it completely dull after leaving it for two hours. Upon introducing a bubble of air into the phial, phosphorescence for a few minutes was restored; new bubbles of air produced the same effects; but afterwards the phosphorescence became constant as in the atmospheric air, apparently because the water took up that of which it had been deprived by ebullition.

PHOSPHOROUS ACID. See PHOSPHORIC ACID.

PHOSPHORIC ACID. PHOSPHOROUS or PHOSPHOREOUS ACID. To understand the nature of these two acids more clearly, the reader should commence with the article PHOSPHORUS, as the basis from which they are produced; but which, though it takes the lead in scientific study, we have been compelled to introduce subsequently, or we should have broken through the order of the alphabet.

Phosphorus, like sulphur, and azote, forms an acid with two different proportions of oxygen. Combined with a maximum of oxygen it constitutes phosphoric acid; with a smaller proportion the result is phosphorous acid. Some chemists have supposed that there is a very close degree of analogy between the manner in which these two acids are produced, and the relation they bear to each other, and the nitric and nitrous, conceiving that the phosphorous acid is nothing more than the phosphoric holding some uncombined phosphorus in solution, in the same way as the nitrous acid may be considered as the nitric holding dissolved nitrous gas; or in other words, that all the oxygen of the phosphorous acid is combined

with a part only of the phosphorus, and in the proportions in which phosphoric acid is constituted; and that the superabundant phosphorus of the phosphorous acid is only in loose combination with the remainder. Perhaps this is the proper way of considering the subject; for though the phosphorous acid cannot be made by digesting phosphorus in the phosphoric acid, the former acid may be converted into the latter by mere heat, which drives off the excess of phosphorus.

Both these acids remained unknown till after the discovery of phosphorus. Boyle is perhaps the first chemist who notices even the phosphoric acid; but Margraff earliest examined its properties, and demonstrated it to be an acid of a peculiar kind. These properties were afterwards still farther and more completely investigated by Bergman, Scheele, Lavoisier, Pearson, Fourcroy, and Vauquelin, as well as various other distinguished chemists.

Phosphorous acid is produced by the slow combustion of phosphorus in atmospheric air; or that combustion which is excited in all the common temperatures at which phosphorus becomes simply luminous without bursting into flame. It may be safely performed in small quantities at any heat below the melting point of phosphorus.

Phosphorous acid is conveniently prepared according to Peltier's method. Inclose sticks of phosphorus, each in a small glass tube, quite open at one end, and drawn out to a capillary tube at the other. Arrange any number of these in a glass funnel, with the smaller end of the tube downwards, and set the funnel in an empty glass bottle. The contact of the air instantly begins the slow combustion of the phosphorus, and a luminous vapour arises from each tube. But if this vapour, which is phosphorized azote in the act of union with oxygen, is allowed to disperse freely in the air, most of the phosphorus would be wasted away and lost: so that it is found necessary to confine it by setting the bottle and funnel on a plate with a little warm water at bottom, and inverting over the whole a large glass bell, with an opening in the middle, loosely corked, through which sufficient air may be let in from time to time to maintain the slow combustion of the phosphorus that is inclosed. In this way the phosphorus gradually deliquesces into a liquid acid, which falls in drops through the tube and funnel into the vessel below. About three times the weight of the phosphorus employed may be collected. The use of confining each stick of phosphorus in a separate tube is to guard against the dangerous accident of the whole phosphorus taking fire; for though a single stick of it may be exposed to any natural temperature without kindling, it has been found that when a number of sticks are heaped together and exposed to the air from 65° to 70° , so much heat is generated by the slow combustion as to cause the whole to inflame, which might be productive of the most serious consequences.

The acid which drops from the phosphorus in this process is the phosphorous or phosphoreous as it is often called, and is a transparent liquor of the consistence of syrup, streaky when shaken, without smell, and with a strongly acid and peculiar taste. When heated in a retort it first thickens by the loss of its superfluous water; after which a number of bubbles arise to the surface, and break with a white smoke, which is luminous in the dark, smells strongly of phosphuretted hy-

PHOSPHORIC ACID.

drogen, and sometimes actually takes fire. In an open vessel these bubbles kindle the instant they reach the surface. By continuing the heat for a considerable time all the superfluous phosphorus is burnt off, and the liquor is now converted into phosphoric acid.

Phosphoreous acid added to such of the metals as disengage hydrogen during solution, such as iron and zinc, dissolves them with the production of a fetid gas, luminous in the dark, but not inflammable *per se*, which is hydrogen, holding a very small portion of phosphorus in solution, or what may be termed sub-phosphuretted hydrogen. The residue is the phosphat of the metal employed.

This acid mixes with water in all proportions, and cannot be rendered solid by evaporation without losing the excess of phosphorus, which distinguishes it from the phosphoric.

Phosphoric acid is found native in several states of combination, particularly with lead and lime, and it composes a great part of the earth of bones, whence it is extracted in making PHOSPHORUS, which see; but it is never found native uncombined with a base.

There are two methods of preparing it; one directly from phosphorus, the other by the decomposition of phosphat of lime. The former gives it more certainly in a state of absolute purity.

Phosphoric acid is produced by the rapid combustion of phosphorus in oxygen, which may be done either over mercury or water. After combustion, which gives intense heat, and light, the acid sublimes in white crystalline flakes, that concrete on the inner surface of the vessel, and which soon deliquesce into a very strong acid. If this be done over water, it should be over a very thin stream of this fluid, and then by washing out the jar with it, all the acid mixes with the water, and may be concentrated by evaporation.

But the usual method of procuring this acid is by throwing phosphorus in small pieces at a time into hot nitric acid. A violent effervescence takes place, the phosphorus combines with oxygen, and nitrous gas is emitted. After the whole of the phosphorus is acidified, the liquid is to be evaporated to dryness, in order to drive off the remains of nitric acid which may not have been decomposed. This process was first put in practice by Lavoisier. Care must be taken not to apply too much heat nor to add too much phosphorus at once, and not to have the nitric acid too strong; otherwise the phosphorus will take fire, and perhaps break the vessels to pieces. When the acid thus prepared is concentrated and heated, it always emits a considerable quantity of phosphuretted hydrogen gas, which burns and occasions a considerable loss. The loss may be diminished by cautiously dropping nitric acid into the hot mass.

This acid may also be obtained from phosphat of lime in considerable quantity, by means of sulphuric acid and ammonia.

Phosphoric acid, in whatever way prepared, has the following properties. When concentrated as much as possible, retaining the liquid form, it is a thick unctuous looking fluid of the specific gravity of 2°, or sometimes more; strongly acid, but with no other taste, nor any smell. It is capable of the concrete form under certain circumstances. When produced by combustion in the way already mentioned it appears in crystalline flakes, but very deliquescent. The liquid acid

also, when of 2° specific gravity, if kept for several days at 32° or thereabouts, will gradually deposit small needle crystals. Even in the summer this takes place when quite at rest, but in a longer period of time.

Phosphoric acid is entirely unaltered and fixed in the fire. When the liquid acid is heated it first parts with its water; then, the heat being continued, it becomes a clear gelatinous mass; and, at last, when the heat is raised to redness, it bubbles and swells, and finally settles into a clear colourless acid glass; which, however, is again soluble in water, and returns to its former state. The gelatinous acid is extremely deliquescent, and the vitreous acid in some degree; and by exposure to air they both return to the state of the unctuous liquid acid. The vitreous acid is a very powerful flux for all earthy and many metallic substances, and strongly acts upon earthen crucibles, so that in fact it can hardly be obtained absolutely pure unless melted in a platina crucible: the phosphoric and the boracic acids resemble each other so strongly in their unalterability in any fire, and their powerful action as a flux, that they have been thought to be the same substance under different modifications; but no experiments have as yet confirmed this opinion.

This acid is not acted upon by hydrogen or sulphur, but charcoal decomposes it entirely in a strong heat.

When in a liquid state it is capable of oxydising some of the metals, especially if assisted by heat, during which hydrogen gas escapes: whence it is obvious that the oxydisement is owing to the decomposition of water. In this manner it oxydises iron, tin, lead, zinc, antimony, bismuth, and manganese; on some of which, however, it acts very slowly. When fused with several of these metals, as tin, iron, and zinc, it is converted into phosphorus; a proof that they have a stronger affinity for oxygen.

It does not act upon gold, platinum, silver, copper, mercury, arsenic, cobalt, nickel. It appears, however, to have some action on gold in the dry way, as it is called; for when fused with gold-leaf it assumes a purple colour; a proof that the gold has been oxydised.

Phosphoric acid combines with alkalies, earths, and metallic oxyds, and forms with them salts known by the name of PHOSPHATS, which see.

The component parts of this acid have been ascertained in a more satisfactory manner than almost any other chemical compound. M. Lavoisier proved that 45 parts of phosphorus, when burnt in oxygen, absorbed about 69.375 parts of that gas, and produced about 114 parts of phosphoric acid. Hence it follows that this acid is composed of about

60 oxygen
40 phosphorus
100

or three parts of oxygen to two of phosphorus. Thirty grains of phosphorus, converted into an acid by nitric acid, and precipitated by lime, gave, according to Dr. Thomson, a precipitate that contained 79 grains of phosphoric acid. This would show phosphoric acid to be composed of

62 oxygen
38 phosphorus
100

a result which does not differ much from the preceding.

PHOSPHORUS.

This acid is too expensive to be brought into common use. If it could be procured at a cheap rate it might be employed with advantage, not only in several important chemical manufactures, but also in medicine, and perhaps even for purposes of domestic economy.

PHOSPHORUS OF KUNCKEL. (from *φωσ*, light, and *κρῆνω*, to carry.) This has hitherto been regarded as a simple combustible, and must be so regarded at present, though various experiments with very high degrees of Voltaic electricity appear to have detected that it is a compound, possessing hydrogen and oxygen with a peculiar base. In consistence it resembles wax; when pure it is nearly of the transparency of gum opal, of a colour varying from amber red to the faintest straw, highly combustible, and when oxygenated producing a strong and peculiar acid.

It was discovered by a German chemist of the name of Brandt, about a hundred and fifty years ago, and the preparation was long kept a lucrative secret in the hands of a few persons. It was however well known, from various facts that had escaped, that it was procured in some way or other from human urine; and it has at length been found that it is in consequence of this substance containing a peculiar salt, hence denominated phosphoric salt (a mixture of phosphorus and oxygen), that phosphorus can be procured from it; as it has also that it can in like manner be procured from any other animal substance impregnated with the same material; and consequently from the bones and crustaceous integuments of animals, in which it exists in a larger abundance, and which are now therefore usually employed for this purpose.

One of the earliest chemists next to Brandt who devoted his attention in a very considerable degree towards obtaining this combustible was Kunckel. This chemist had seen the new product soon after its discovery by Brandt; and strongly desirous of possessing the secret, he associated himself with a friend of Brandt's, whose name was Krafft, through whom he made an offer to purchase the discovery of its inventor. Brandt consented to disclose it; but Krafft, instead of benefiting his colleague by the communication, paid the money, and retained the secret to himself.

Kunckel at this time knew nothing more of the preparation than that it was obtained by a series of processes from urine, through the medium of fire; and with this brief and unsatisfactory outline he set to work, and was at length fortunate enough to discover the method for himself; on which account the substance long went under the name of Kunckel's phosphorus. Mr. Boyle is also considered as one of the discoverers of phosphorus. He communicated the secret of the process of preparing it to the Royal Society of London in 1680. It is asserted, indeed, by Krafft, that he discovered the secret to Mr. Boyle, having in the year 1678 carried a small piece of it to London to show it to the royal family; but there is little probability that a man of such integrity as Mr. Boyle would claim the discovery of the process as his own, and communicate it to the Royal Society, if this had not been the case. Mr. Boyle communicated the process to Godfrey Hankwitz, an apothecary of London, who for many years supplied Europe with phosphorus, and hence it went under the name of English phosphorus. In the year 1774, the Swedish chemists, Gahn and Scheele, made the important discovery, that phosphorus is contained in the bones of animals, and they improved the processes or procuring it.

The most convenient process for obtaining phosphorus seems to be that recommended by Fourcroy and Vauquelin, which we shall transcribe. Take a quantity of burnt bones, and reduce them to powder. Put 100 parts of this powder into a porcelain or stone-ware bason, and dilute it with four times its weight of water. Forty parts of sulphuric acid are then to be added in small portions, taking care to stir the mixture after the addition of every portion. A violent effervescence takes place, and a great quantity of air is disengaged. Let the mixture remain for twenty-four hours, stirring it occasionally, to expose every part of the powder to the action of the acid. The burnt bones consist of the phosphoric acid and lime; but the sulphuric acid has a greater affinity for the lime than the phosphoric acid. The action of the sulphuric acid uniting with the lime, and the separation of the phosphoric acid, occasion the effervescence. The sulphuric acid and the lime combine together, being insoluble, and fall to the bottom. Pour the whole mixture on a cloth filter, so that the liquid part, which is to be received in a porcelain vessel, may pass through. A white powder, which is the insoluble sulphate of lime, remains on the filter. After this has been repeatedly washed with water, it may be thrown away; but the water is to be added to that part of the liquid which passed through the filter. Take a solution of sugar of lead in water, and pour it gradually into the liquid in the porcelain bason. A white powder falls to the bottom, and the sugar of lead must be added so long as any precipitation takes place. The whole is again to be poured upon a filter, and the white powder which remains is to be well washed and dried. The dried powder is then to be mixed with one-sixth of its weight of charcoal powder. Put this mixture into an earthen-ware retort, and place it in a sand bath, with the beak plunged into a vessel of water. Apply heat, and let it be gradually increased, till the retort becomes red hot. As the heat increases, air-bubbles rush in abundance through the beak of the retort, some of which are inflamed when they come in contact with the air at the surface of the water. A substance at last drops out similar to melted wax, which congeals under the water. This is phosphorus. To have it quite pure, melt it in warm water, and strain it several times through a piece of shamoy leather under the surface of the water. To mould it into sticks, take a glass funnel with a long tube, which must be stopped with a cork. Fill it with water, and put the phosphorus into it. Immerse the funnel in boiling water, and when the phosphorus is melted, and flows into the tube of the funnel, then plunge it into cold water, and when the phosphorus has become solid, remove the cork, and push the phosphorus from the mould with a piece of wood. Thus prepared, it must be preserved in close vessels, containing pure water. When phosphorus is perfectly pure, it is semi-transparent, and has the consistence of wax. It is so soft, that it may be cut with a knife. Its specific gravity is from 1.77 to 2.03. It has an acrid and disagreeable taste, and a peculiar smell, somewhat resembling garlic.

When a stick of phosphorus is broken, it exhibits some appearance of crystallization. The crystals are needle-shaped, or long octahedrons; but to obtain them in their most perfect state, the surface of the phosphorus, just when it becomes solid, should be pierced, that the internal liquid phosphorus may flow out, and leave a cavity for their formation. When phosphorus is exposed to the

PHOSPHORUS.

light it becomes of a reddish colour, which appears to be an incipient combustion. It is therefore necessary to preserve it in a dark place. At the temperature of 99° it becomes liquid, and if air be entirely excluded, evaporates at 219° , and boils at 554 . At the temperature of 43° or 44° , it gives out a white smoke, and is luminous in the dark. This is a slow combustion of the phosphorus, which becomes more rapid as the temperature is raised. When phosphorus is heated to the temperature of 148° it takes fire, burns with a bright flame, and gives out a great quantity of white smoke. Phosphorus enters into combination with oxygen, azote, hydrogen, and carbon. Phosphorus is soluble in oils, and when thus dissolved forms what has been called liquid phosphorus, which may be rubbed on the face and hands without injury. It dissolves too in ether, and a very beautiful experiment consists in pouring this phosphoric ether in small portions, and in a dark place, on the surface of hot water. The phosphoric matches consist of phosphorus extremely dry, minutely divided, and perhaps a little oxygenized. The simplest mode of making them is to put a little phosphorus, dried by blotting paper, into a small phial; heat the phial, and when the phosphorus is melted turn it round, so that the phosphorus may adhere to the sides. Cork the phial closely, and it is prepared. On putting a common sulphur match into the bottle, and stirring it about, the phosphorus will adhere to the match, and will take fire when brought out into the air.

The white smoke given forth by phosphorus when exposed to a heat of 148° , appears when collected and examined to be an acid of a peculiar kind, and it is this acid which is now denominated phosphoric acid.

Phosphorus combines readily with sulphur, and the two substances are capable of being mixed in different proportions. Seventy-two grains of phosphorus and nine of sulphur when heated in about four ounces of water melt with a gentle heat. The compound remains fluid till it is cooled down to 77° , and then becomes solid: these substances have also been combined in the same manner in the following proportions.

4 Phosphorus	}	this compound congeals at 59°
1 Sulphur		
4 Phosphorus	}	 50
2 Sulphur		
4 Phosphorus	}	 41
4 Sulphur		
4 Phosphorus	}	 99
12 Sulphur		

When the phosphorus predominates, the compound is called phosphuret of sulphur; and when the sulphur predominates, it is called, on the contrary, sulphuret of phosphorus.

Phosphor and sulphur may be combined also by melting them together without any water: but the combination takes place so rapidly that they are apt to rush out of the vessel if the heat be not extremely moderate. Phosphorus is likewise capable of combining with many other bodies; in which cases the products are called phosphurets of the body employed. See PHOSPHURETS.

The affinities of phosphorus have not yet been ascertained.

PHOSPHORUS (Medicinal use of). The earliest account we have concerning the medicinal use of phosphorus is in the seventh volume of Haller's Collection of Theses, relating to the history and cure of diseases. The original dissertation is en-

titled *De Phosphori Loco Medicamenti adsumpti virtute medica*, aliquot casibus singularibus confirmata, Auctore J. Gabi Mentz. There are three cases of singular cures performed by means of phosphorus narrated in this thesis; but as the work is in the library of many medical men in this country, it is not deemed necessary to translate those cases fully. It may be proper to premise, however, that the history of these cases and cures was sent to Dr. Gabi Mentz by his father.

The first history is of a man who laboured under a putrid fever; for whom the best alexipharmic medicines, as they are called, together with a proper regimen, were prescribed. A diarrhoea, however, ensued, accompanied with great anxiety about the præcordia, delirium, and general prostration of the powers of life. Proper remedies were tried to stop the diarrhoea, and check the disease, but in vain. For three days the patient had been insensible and exhausted. In this extremity, the physician had recourse to phosphorus; two grains of which were exhibited, together with a sufficient quantity of theriaca to make them into a bolus. This occasioned a gentle sweat, and general quiet. The dose was twice repeated in the evening, and again towards morning, with the addition of another grain. The sweat became copious, and the memory and the use of the external senses were restored. The patient, thus revived, was afterwards completely re-established by other remedies.

The second case is that of a man who laboured under a bilious fever. Although various remedies appear to have been judiciously employed, yet the disease gained ground, until at last the patient was almost quite exhausted. Three grains of phosphorus were exhibited at eleven o'clock in the forenoon, which produced a little quiet; but the patient became so thirsty that he could not refrain from drinking. After this he was quiet for two hours, and a profuse sweat broke out all over his body. The physician seeing this, ordered him another dose in the evening. He slept and perspired the whole evening, and, by means of proper remedies, was afterwards completely cured.

The third case is entitled, *A malignant catarrhal fever, with petechia*. It seems to have been the common typhus putridus of Cullen, accompanied with cough and catarrhal symptoms in the beginning. We are informed, that on the third day of the disease the patient was deprived of the use of his external senses; that he became delirious, and exceedingly exhausted. Two grains of phosphorus were given to him at two o'clock, and two more in the evening, which restored him to his senses, and occasioned a copious sweat. Proper remedies were afterwards employed, which accomplished his recovery.

Dr. Mentz appears to have been one of the first practitioners who tried this heroic remedy internally. Dr. Morgenstern and Dr. Hatman seem both to have afterwards employed it.

Other interesting accounts of the prodigious powers of phosphorus have been published by Dr. Wolf (in his inaugural oration at Gottingen in 1791), by Dr. Weickard, and M. Alphonso Leroi: the latter writer affirms that the divisibility of phosphorus is almost infinite; and in proof of this assertion he states, that "the body of a woman who died of a putrid fever, and who had taken one grain of phosphorus, was entirely luminous within. The hands of the late Ruelle, the anatomist,

who opened the body, were luminous some hours after they had been washed!?"

Upon maturely considering all the facts which have been brought forward concerning it, little room for doubt will be left in the mind as to its uncommon powers; but, although this be granted, experience is still wanting to point out the diseases, and various stages of disease, in which it may be employed with equal safety and utility, as also to determine the circumstances under which it would be dangerous even to try it. Thus much may doubtless be asserted concerning it, that it is one of the highest stimuli which we have in the catalogue of the materia medica; and that although it is affirmed by M. Leroi, and others, to be "calming and sedative," it is only so in such cases as wine, ether, Hoffman's anodyne liquor, and opium, are also found to be calming and sedative, that is, in cases where the arterial action of the whole frame is nearly exhausted, although still quick. Every practitioner should be cautioned against exhibiting it in any inflammatory disease, where much strength exists; and, in all cases, very small doses should be first exhibited, and those with the utmost circumspection.

PHOSPHURETS. (*phosphuretum*, from *phosphorus*.) Combinations of phosphorus, not oxygenated, with different bases; as, phosphuret of copper, phosphuret of iron, &c.

PHOSPHURETTED HYDROGEN, phosphorus dissolved in hydrogen gas; which may be done by introducing phosphorus into a glass jar of hydrogen gas standing over mercury, and then melting it by means of a burning glass; the gas dissolves a large proportion of it. The compound has a very fetid odour, something like that from putrid fish. When it comes into contact with common air, it burns with great rapidity, and if mixed with that air it detonates violently. Oxygen gas produces a still more rapid and brilliant combustion than common air. When bubbles of it are made to pass up through water, they explode in succession as they reach the surface of the liquid; a beautiful column of white smoke is formed. This gas is the most combustible substance known. Its combustion is the combination of its phosphorus and hydrogen with the oxygen of the atmosphere, and the products are phosphoric acid and water. These substances, mixed or combined, constitute the white smoke.

This substance was discovered by M. Genèmbre; and in 1783 by Mr. Kirwan, before he became acquainted with the experiments of Genèmbre. But for the fullest investigation of its properties we are indebted to Mr. Raymond, who published a dissertation on it in 1791, and another in 1800. These philosophers, indeed, obtained the gas by a different and more operose process, but in whatever manner it is prepared its properties are always the same.

When electric explosions are passed through this gas, its bulk is increased precisely as happens to carburetted hydrogen: the water which it contains is decomposed, phosphoric acid formed, and hydrogen gas evolved. We are neither acquainted with the specific gravity nor with the proportion of the constituents of this gas.

PHOTOMETER, an apparatus for measuring the intensity of light, and likewise the transparency of the medium through which it passes. Instruments for these purposes have been invented by M. de Saussure, Count Rumford, Mr. Leslie, &c. Professor Leslie's is indeed the simplest instrument of the kind of

which we have any where met with a description; but it measures only the momentary intensities of light; and he who wishes to be informed of its construction, will find that information in the third volume of Nicholson's Philosophical Journal, 4to, or in the professor's interesting work on the nature of heat.

PHOTOPHOBIA. (*φωτοφωβία*, from *φως*, light, and *φοβω*, to dread.) Such an intolerance of light, that the eye, or rather the retina, can scarcely bear its irritating rays. Such patients generally wink, or close their eyes in light, which they cannot bear without exquisite pain, or confused vision. The proximate cause is too great a sensibility in the retina. The species are; 1. Photophobia inflammatoria, or dread of light from an inflammatory cause, which is a particular symptom of the internal ophthalmia. 2. Photophobia, from the disuse of light, which happens to persons long confined in dark places or prisons; on the coming out of which into light, the pupil contracts, and the persons cannot bear light. The depression of the cataract occasions this symptom, which appears as though fire and lightning entered the eye, not being able to bear these strong rays of light. 3. Photophobia nervea, or a nervous photophobia, which arises from an increased sensibility of the nervous expansion and optic nerve. It is a symptom of the hydrophobia, and many disorders, both acute and nervous. 4. Photobia, from too great light, as looking at the sun, or at the strong light of modern lamps.

PHOTOPSIA. (*φωτοψία*; from *φως*, light, and *ψία*, vision.) Lucid vision. An affection of the eye in which the patient perceives luminous rays, ignited lines, or coruscations.

PHRAATES 1st, a king of Parthia, who succeeded Arsaces the 3d, called also Phriapatus. He made war against Antiochus, king of Syria, and was defeated in three successive battles. The 2d succeeded his father Mithridates as king of Parthia. He was murdered by some Greek mercenaries who had been once his captives, and who had enlisted in his army, B. C. 129. The 3d succeeded his father Pacorus on the throne of Parthia. Soon after he invaded the kingdom of Armenia, to make his son-in-law sit on the throne of his father. His expedition was attended with ill success. At his return to Parthia he was assassinated by his sons Orodes and Mithridates. The 4th was nominated king of Parthia by his father Orodes, whom he soon after murdered, as also his own brothers. He made war against M. Antony with great success, and obliged him to retire with much loss. Some time after he was dethroned by the Parthian nobility, but he soon regained his power, and expelled the usurper, called Titidates. He afterwards gained the friendship and protection of Augustus, and restored the Roman ensigns which the Parthians had taken from Crassus and Antony, and gave up his four sons with their wives as hostages, till his engagements were performed. He was, however, at last murdered by one of his concubines, who

placed her son, called Phraatices, on the throne.

PHRAATICES, a son of Phraates 4th, king of Parthia, who, with his mother, murdered his father, and took possession of the throne. His reign was short; he was deposed by his subjects, whom he had offended by cruelty and oppression.

PHRAORTES succeeded his father Deioces on the throne of Media. He made war against the neighbouring nations, and conquered the greatest part of Asia. He was defeated and killed in a battle by the Assyrians, after a reign of 22 years, B. C. 625.

PHRASE. *s.* (φρασις.) 1. An idiom; a mode of speech peculiar to a language. 2. An expression; a mode of speech (*Tillotson*). 3. Style; expression (*Shakspeare*).

To **PHRASE**. *v. a.* (from the noun.) *To* style; to call; to term (*Shakspeare*).

PHRASEOLOGY. *s.* (φρασις and λογω.) 1. Style; diction (*Swift*). 2. A phrase book (*Ainsworth*).

PHREATIS, or **PHREATTIUM**, in Grecian antiquity, was a court belonging to the civil government of Athens, situated upon the sea-shore, in the Piræus. The name is derived from *απο τη φρεως*, because it stood in a pit; or, as others suppose, from the hero Phreatus. This court heard such causes as concerned persons who had fled out of their own country for murder, or those that fled for involuntary murder, and who had afterwards committed a deliberate and wilful murder.

PHRENES. (from φρεν, the mind, because the ancients imagined it was the seat of the mind.) The diaphragm. See **DIAPHRAGM**.

PHRENETIC. **PHRENTIC**. *a.* (φρενιτικός; *phrenetique*, French.) Mad; inflamed in the brain; frantic (*Woodward*).

PHRENIC NERVE. (*nervus phrenicus*, from φρενς, the diaphragm.) Diaphragmatic nerve. It arises from a union of the branches of the third, fourth, and fifth cervical pairs, on each side, passes between the clavicle and subclavian artery, and descends from thence by the pericardium to the diaphragm.

PHRENITE, a species of zeolite. See **ZEOLITHUS**.

PHRENITIS. (φρενιτις; from φρεν, the mind.) Phrenzy or inflammation of the brain. A genus of disease in the class pyrexiae, and order phlegmasiæ of Cullen; characterized by strong fever, violent headach, redness of the face and eyes, impatience of light and noise, watchfulness, and furious delirium. It is symptomatic of several diseases, as worms, hydrophobia, &c. Phrenitis often makes its attacks with a sense of fullness in the head, flushing of the countenance, and redness of the eyes, the pulse being full, but in other respects natural. As these symptoms increase, the patient becomes restless, his sleep is disturbed, or wholly forsakes him. It sometimes comes on, as in the epidemic, of which Saalman gives an account, with pain, or a peculiar sense of uneasiness of the head, back, loins, and joints; in some cases, with tremor of their limbs,

and intolerable pains of the hands, feet, and legs. It now and then attacks with stupor, and rigidity of the whole body, sometimes with anxiety and a sense of tension referred to the breast, often accompanied with palpitation of the heart. Sometimes nausea and a painful sense of weight in the stomach are among the earliest symptoms. In other cases, the patient is attacked with vomiting, or complaints of the heart-burn, and griping pains in the bowels. When the intimate connection which subsists between the brain and every part of the system is considered, the variety of the symptoms attending the commencement of phrenitis is not so surprising, nor that the stomach in particular should suffer, which so remarkably sympathizes with the brain. These symptoms assist in forming the diagnosis between phrenitis and synocha. The pain of the head soon becomes more considerable, and sometimes very acute. "If the meninges," says Dr. Fordyce, "are affected, the pain is acute; if the substance only, obtuse, and sometimes but just sensible." And Dr. Cullen remarks, "I am here, as in other analagous cases, of opinion, that the symptoms above mentioned of an acute inflammation, always mark inflammations of membranous parts, and that an inflammation of paranchyma, or substance of viscera, exhibits, at least commonly, a more chronic inflammation."

The seat of the pain is various: sometimes it seems to occupy the whole head; sometimes, although more circumscribed, it is deep-seated, and ill-defined. In other cases it is felt principally in the forehead or occiput. The redness of the face and eyes generally increases with the pain, and there is often a sense of heat and throbbing in the head, the countenance acquiring a peculiar fierceness. These symptoms for the most part do not last long before the patient begins to talk incoherently, and to show other marks of delirium. Sometimes, however, Saalman observes, delirium did not come on till the fifth, sixth, or seventh day. The delirium gradually increases, till it often arrives at a state of phrenzy. The face becomes turgid, the eyes stare, and seem as if bursting from their sockets, tears, and sometimes even blood, flowing from them; the patient in many cases resembling a furious maniac, from whom it is often impossible to distinguish him, except by the shorter duration of his complaint. The delirium assists in distinguishing phrenitis and synocha, as it is not a common symptom in the latter. When delirium does attend synocha, however, it is of the same kind as in phrenitis.

We should, *a priori*, expect in phrenitis considerable derangement in the different organs of sense, which so immediately depend on the state of the brain. The eyes are incapable of bearing the light, and false vision, particularly that termed *muscæ volitantes*, and flashes of light seeming to dart before the eyes, are frequent symptoms. The hearing is often so acute, that the least noise is intolerable; sometimes, on the other hand, the patient becomes

P H R E N I T I S.

deaf; and the deafness, Saalman observes, and morbid acuteness of hearing, sometimes alternate. Affections of the smell, taste, and touch, are less observable.

As the organs of sense are not frequently deranged in synocha, the foregoing symptoms farther assist the diagnosis between this complaint and phrenitis.

The pulse is not always so much disturbed at an early period, as we should expect from the violence of the other symptoms, compared with what we observe in idiopathic fevers. When this circumstance is distinctly marked, it forms, perhaps, the best diagnosis between phrenitis and synocha, and gives to phrenitis more of the appearance of mania. In many cases, however, the fever runs as high as the delirium; then the case often almost exactly resembles a case of violent synocha, from which it is the more difficult to distinguish it, if the pulse be full and strong. In general, however, the hardness is more remarkable than in synocha, and in many cases the pulse is small and hard, which may be regarded as one of the best diagnostics between the two complaints, the pulse in synocha being always strong and full. In phrenitis it is sometimes, though rarely, intermitting. The respiration is generally deep and slow, sometimes difficult, now and then interrupted with hiccup, seldom hurried and frequent; a very unfavourable symptom. In many of the cases mentioned by Saalman, pneumonia supervened.

The deglutition is often difficult, sometimes convulsive. The stomach is frequently oppressed with bile, which is an unfavourable symptom; and complete jaundice, the skin and the urine being tinged yellow, sometimes supervenes. Worms in the stomach and bowels are also frequent attendants on phrenitis, and there is reason to believe, may have a share in producing it. The hydrocephalus internus, which is more allied to phrenitis than dropsy of the brain, properly so called, seems often, in part at least, to arise from derangement of the primæ viæ, particularly from worms. We cannot otherwise account for the frequent occurrence of these complaints.

Instead of a superabundance of bile in the primæ viæ, there is sometimes a deficiency, which seems to afford even a worse prognosis. The faces alvinæ being of a white colour, and a black cloud in the urine, are regarded by Lobb as fatal symptoms. The black cloud in the urine is owing to an admixture of blood: when unmixd with blood, the urine is generally pale.

There is often a remarkable tendency to the worst species of hæmorrhages, towards the fatal termination of phrenitis. Hæmorrhagy from the eyes has already been mentioned. Hæmorrhagy from the intestines also, tinging the stools with a black colour, is not uncommon. These hæmorrhages are never favourable; but the hæmorrhages characteristic of synocha, particularly that from the nose, sometimes occur at an earlier period, and, if copious, generally bring relief. More fre-

quently, however, blood drops slowly from the nose, demonstrating the violence of the disease, without relieving it. In other cases there is a discharge of thin mucus from the nose.

Tremors of the joints, convulsions of the muscles of the face, grinding of the teeth, the face from being florid suddenly become pale, involuntary tears, a mucus from the nose, the urine being of a dark red or yellow colour, or black, or covered with a pellicle, the faces being either bilious or white, and very fætid, profuse sweat of the head, neck, and shoulders, paralysis of the tongue, general convulsions, much derangement of the internal functions, and the symptoms of other visceral inflammations, particularly of pneumonia, supervening, are enumerated by Saalman as affording the most unfavourable prognosis. The delirium changing to coma, the pulse at the same time becoming weak, and the deglutition difficult, was generally the forerunner of death. When, on the contrary, there is a copious hæmorrhagy from the hæmorrhoidal vessels, from the lungs, mouth, or even from the urinary passages, when the delirium is relieved by sleep, and the patient remembers his dreams, when the sweats are free and general, the deafness is diminished or removed, and the febrile symptoms become milder, there are hopes of a recovery.

In almost all diseases, if we except those which kill suddenly, as the fatal termination approaches, nearly the same train of symptoms supervenes, viz. those denoting extreme debility of all the functions. Saalman remarks that the blood did not always shew the buffy coat.

Phrenitis, like most other complaints, has sometimes assumed an intermitting form, the fits coming on daily, sometimes every second day. When phrenitis terminates favourably, the typhus, which succeeds the increased excitement, is generally less in proportion to that excitement, than in idiopathic fevers; a circumstance which assists in distinguishing phrenitis from synocha.

The imperfect diagnosis between these complaints is further assisted by the effects of the remedies employed. For if in phrenitis in removing the delirium and other local symptoms, the febrile symptoms in general soon abate. Whereas in synocha, although the delirium and head-ach be removed, yet the pulse continues frequent, and other marks of indisposition remain for a much longer time.

It will be of use to present at one view the circumstances which form the diagnosis between phrenitis and synocha.

Synocha generally makes its attack in the same manner; its symptoms are few and little varied. The symptoms at the commencement of phrenitis are often more complicated, and differ considerably in different cases. Derangement of the internal functions are comparatively rare in synocha. In phrenitis it almost constantly attends, and often appears very early. The same observation applies to the derangement of the organs of sense. In synocha, the pulse from the commencement is frequent, slow, and rapid. In phrenitis, symp-

toms denoting the local affection often become considerable before the pulse is much disturbed. In phrenitis we have seen that the pulse sometimes very suddenly loses its strength, the worst species of hæmorrhages and other symptoms denoting extreme debility shewing themselves; such symptoms are generally the forerunner of death. But that when the termination is favourable, the degree of typhus which succeeds it is less in proportion to the preceding excitement in synocha. Lastly, if we succeed in removing the delirium and other symptoms affecting the head, the state of the fever is found to partake of this favourable change more immediately and completely than in synocha, where although we succeed in relieving the head-ach or delirium, the fever often suffers little abatement.

With regard to the duration of phrenitis, Eller observes, that when it proves fatal, the patient generally dies within six or seven days. In many fatal cases, however, it is protracted for a longer time, especially where the remissions have been considerable. Upon the whole, however, the longer it is protracted, providing the symptoms do not become worse, the better is the prognosis.

PHRENITIS, means also an inflammation of the diaphragm, within which region the mind was supposed to reside upon various theories of Grecian philosophy.

PHRENSY. *s.* (from *φρενις*; *phrenesie*, French.) Madness; franticness (*Milton*).

PHRYGANEÆ, in zoology, a genus of the class insecta, order neuroptera. Mouth with a horny, short, curved mandible; feelers four; stemmata three; antennæ setaceous, longer than the thorax; wings equal, incumbent, the lower ones folded. These are seen in a summer's evening floating in the air in large masses, and are eagerly devoured by swallows; they are easily distinguished from the smaller moths, by their wanting the spiral-tongue: the larvæ is six-footed, found at the bottom of shallow water, inclosed in a tube composed of sand, straws or small chips of wood, and is known to fishermen by the name of caddy or caddo: that of the first of the ensuing divisions is tailed with seven gills or fins; of the others slightly hairy with two claws on the tail, and three erect tentacles on the fourth segment; the pupæ resembles the perfect insect. Fifty-five species; a few American, the rest European insects; about twenty inhabitants of our own country. They are thus subdivided:

A. Tail with two truncate bristles: comprising the semblis of Fabricius, and consisting of only four species.

B. Tail bristleless: consisting of the rest.

The following are chiefly worthy of notice.

1. *P. grandis*. Wings brown, testaceous, with cinereous spots; measures rather more than an inch in length, and has very much the appearance of a phalæna. This is one of the largest species, and is the common caddy or cadow bait of anglers.

2. *P. rhombica*. Wings grey-brown, with rhombic whitish spots, smaller than the pre-

ceding. Larvæ inclosed in a web made of short pieces of grass laid transversely.

3. *P. bicaudata*. Frequents equally the banks of rivers and of standing pools; the wings a third longer than the body, narrow at the top, and broad below, and reticulated with brown veins; colour dark brown, with a single longitudinal streak passing across the head and thorax; antennæ long, filiform, and of the same colour as the legs and body; appendices of the tail of equal length with the antennæ.

4. *P. saltatrix*. One of the smallest species of the genus. Wings decorated each with a green and white spot; antennæ longer than the body; and when examined with a microscope, appearing velvety; wings hyaline; the small veins by which they are reticulated white at the base, and blackening towards their extremity.

PHRYGES, a river of Asia Minor, dividing Phrygia from Caria, and falling into the Hermus.

PHRYGIA, a country of Asia Minor, generally divided into Phrygia Major and Minor. It was situate between Bythia, Lydia, Cappadocia, and Caria. It received its name from the Eryges, a nation of Thrace, or Macedonia, who came to settle there, and from their name by corruption arose the word Phrygia. Cybele was the chief deity of the country, and her festivals were observed with the greatest solemnity. The invention of the pipe of reeds, and of all sorts of needlework, is attributed to the inhabitants.

The ancient Phrygians are described as superstitious, voluptuous, and effeminate, without any prudence or forecast, and of such a servile temper, that nothing but stripes and ill usage could make them comply with their duty; which gave rise to several trite and well known proverbs. They are said to have been the first inventors of divination by the singing, flying, and feeding of birds. Their music, commonly called the Phrygian mood, is oddly alleged by some as an argument of their effeminacy.

Their government was certainly monarchical; for all Phrygia was, during the reigns of some kings, subject to one prince. Ninnacus, Midas, Manis, Gordius, and his descendants, were undoubtedly sovereigns of all Phrygia. But some time before the Trojan war, we find this country divided into several petty kingdoms, and read of divers princes reigning at the same time. Apollodorus mentions a king of Phrygia contemporary with Ilius king of Troy. Cedrenus and others speak of one Teuthrans, king of a small country in Phrygia, whose territories were ravaged by Ajax, himself slain in single combat, his royal seat laid in ashes, and his daughter, by name Tecmessa, carried away captive by the conqueror. Homer makes mention of Phoreys and Ascanius, both princes and leaders of the Phrygian auxiliaries that came to the relief of Troy. Tantalus was king of Sipylus only, and its district; a prince no less famous for his great wealth, than infamous for his covetousness and other detestable vices. That Phrygia was subdued

either by Ninus, as Diodorus Siculus informs us, or by the Amazons, as we read in Suidas, is not sufficiently warranted. Most authors that speak of Gordius tell us, that the Phrygians having sent to consult an oracle in order to know how they might put an end to the intestine broils which rent their country into many factions and parties, received for answer, that the most effectual means to deliver themselves and their country from the calamities they groaned under was to commit the government to a king. This advice they followed accordingly, and placed Gordius on the throne.

PHRYGIAN, in music, an epithet applied by the ancients to that of their modes which held a middle place between the Lydian and Doric. So called because supposed to have been invented by the Phrygian, Marsyas. The Phrygian mode was one of the most ancient in the Greek music. Its character was bold, impetuous, and vehement to a degree perfectly terrific. In this mode the trumpets and other military instruments were used. The lowest note in this mode corresponded with our E natural on the third space in the bass.

PHRYMA, in botany, a genus of the class didynamia, order gymnospermia. Calyx two-lipped, five-toothed; seed one. Two species, herbs of North America and of the Cape.

PHRYNE, a celebrated prostitute who flourished at Athens about 328 years before the Christian era. She was mistress to Praxiteles, who drew her picture, which was one of his best pieces, and was placed in the temple of Apollo at Delphi. It is said that Apelles painted his Venus Anadyomene after he had seen Phryne on the sea shore naked, and with dishevelled hair.

PHRYNICUS, a tragic poet of Athens, disciple to Thespis. He was the first who introduced a female character on the stage.

PHRYNIS, a musician of Mitylene, the first who obtained a musical prize at the Panathenæa at Athens. He added two strings to the lyre, which had always been used with seven by all his predecessors, B. C. 438.

PHRYNIUM, in botany, a genus of the class monandria, order monogynia. Calyx three-leaved; petals three, equal, growing to the long channelled tube of the nectary; nectary one-leaved, with a filiform tube and four-parted border; capsule three-celled; nuts three. One species, a native of Malabar and China.

PHRYXUS, a son of Athamas, king of Thebes, by Nephele. After the repudiation of his mother, he was persecuted by his step mother Ino, because he was to sit on the throne, in preference to her own children. Being apprized of Ino's intentions upon his life, he secured part of his father's treasures, and privately left Bœotia with his sister Helle, to go to their friend Æetes king of Colchis. They embarked on board a ship, or according to the mythologists, they mounted on the back of a ram whose fleece was of gold, and pro-

ceeded through the air. The height to which they were carried made Helle giddy, and she fell into the sea. Phryxus gave her a decent burial, and after he had called the sea Hellespont from her name, he arrived safe in Colchis, where he offered the ram on the altars of Mars. The king received him with great tenderness, and gave him his daughter Chalciope in marriage. Some time after he was murdered by his father-in-law, who envied him the possession of the golden fleece. The fable of Phryxus has been explained by some who observe, that the ship, on which he embarked, was either called the ram, or carried on her prow the figure of that animal. The fleece of gold is explained by recollecting that Phryxus carried away immense treasures from Thebes. Phryxus was placed among the constellations of heaven after death. The murder of Phryxus gave rise to the celebrated Argonautic expedition, which had for its object the recovery of the golden fleece.

PTHIERIASIS. (*φθειρισις* from *φθειρ*, a louse.) The same as **PTHIRIASIS**, which see.

PTHIA, a town of Phthiotis, at the east of mount Othrys in Thessaly, where Achilles was born, and from which he is often called Phthius heros.

PTHIOTIS, a small province of Thessaly, between the Pelagæus sinus and the Maliacus sinus, Magnesia, and mount Cæta. It was also called Achaia.

PTHIRIASIS, (*φθιρίασις*, *φθειρισις*; from *φθειρ*, a louse.) A disease in which several parts of the body generate lice, which often puncture the skin, and produce little sordid ulcers.

PTHISICAL. *a.* (*φθιδιμος*.) Wasting, consuming.

PTHISIS. (*phthisis*, *φθισις*; from *φθιω*, to consume.) Pulmonary consumption. A genus of disease in the class pyrexia, and order hæmorrhagæ of Cullen; known by emaciation, debility, cough, hectic fever, purulent expectoration, hæmoptysis, diarrhœa. Species: 1. Phthisis incipiens, incipient, without any expectoration of pus. 2. Phthisis humida, with an expectoration of pus. 3. Phthisis scrophulosa, from scrophulous tubercles in the lungs, &c. 4. Phthisis hæmoptoica, from hæmoptysis. 5. Phthisis exanthematica, from exanthemata. 6. Phthisis chlorotica, from chlorosis. 7. Phthisis syphilitica, from a venereal ulcer in the lungs. The causes which predispose to this disease are very numerous. The following are, however, the most general: hereditary disposition; particular formation of body, and obvious by a long neck, prominent shoulders, and narrow chest; scrophulous diathesis, indicated by a fine clear skin, fair hair, delicate rosy complexion, large veins, thick upper lip, a weak voice, and great sensibility; certain diseases, such as syphilis, scrophula, the small pox, and measles; particular employments exposing artificers to dust, such as needle-pointers, stone-cutters, millers, &c. or to the fumes of metals or minerals under a confined and unwholesome air; violent pas-

P H T H I S I S.

sions, exertions or affections of the mind, as grief, disappointment, anxiety, or close application to study, without using proper exercise; frequent and excessive debaucheries, late watching, and drinking freely of strong liquors: great evacuations, as diarrhæa, diabetes, excessive venery, fluor albus, immoderate discharge of the menstrual flux, and the continuing to suckle too long under a debilitated state; and lastly, the application of cold, either by too sudden a change of apparel, keeping on wet clothes, lying in damp beds, or exposing the body too suddenly to cool air, when heated by exercise; in short, by any thing that gives a considerable check to the perspiration. The more immediate or occasional causes of phthisis are, hæmoptysis, pneumonic inflammation proceeding to suppuration, catarrh, asthma, and tubercles, the last of which is by far the most general. The incipient symptoms usually vary with the cause of the disease; but when it arises from tubercles, it is usually thus marked: it begins with a short dry cough, that at length becomes habitual, but from which nothing is spit up for some time, except a frothy mucus that seems to proceed from the fauces. The breathing is at the same time somewhat impeded, and upon the least bodily motion is much hurried: a sense of straitness, with oppression at the chest, is experienced; the body becomes gradually leaner, and great languor, with indolence, dejection of spirits, and loss of appetite, prevail. In this state the patient frequently continues a considerable length of time, during which he is, however, more readily affected than usual by slight colds, and upon one or other of the occasions the cough becomes more troublesome and severe, particularly by night, and it is at length attended with an expectoration, which towards morning is more free and copious. By degrees the matter which is expectorated becomes more viscid and opaque, and now assumes a greenish colour and purulent appearance, being on many occasions streaked with blood. In some cases, a more severe degree of hæmoptysis attends, and the patient spits up a considerable quantity of florid, frothy blood. The breathing at length becomes more difficult, and the emaciation and weakness goes on increasing. With these, the person begins to be sensible of pain in some part of the thorax, which, however, is usually felt at first under the sternum, particularly on coughing. At a more advanced period of the disease a pain is sometimes felt on one side, and at times prevails in so high a degree, as to prevent the person from lying easily on that side; but it more frequently happens, that it is felt only on making a full inspiration, or coughing. Even where no pain is felt it often happens that those who labour under phthisis cannot lie easily on one or other of their sides, without a fit of coughing being excited, or the difficulty of breathing being much increased. At the first commencement of the disease, the pulse is often natural, or perhaps is soft, small, and a little quicker than usual; but when the symptoms which have

been enumerated have subsisted for any length of time, it then becomes full, hard, and frequent. At the same time the face flushes, particularly after eating; the palms of the hands and soles of the feet are affected with burning heat; the respiration is difficult and laborious; evening exacerbations become obvious, and by degrees the fever assumes the hectic form. This species of fever is evidently of the remittent kind, and has exacerbations twice every day. The first occurs usually about noon, and a slight remission ensues about five in the afternoon. This last is, however, soon succeeded by another exacerbation, which increases gradually until after midnight; but about two o'clock in the morning a remission takes place, and this becomes more apparent as the morning advances. During the exacerbations the patient is very sensible to any coolness of the air, and often complains of a sense of cold when his skin is, at the same time, preternaturally warm. Of these exacerbations, that of the evening is by far the most considerable. From the first appearance of the hectic symptoms, the urine is high coloured, and deposits a copious branny red sediment. The appetite, however, is not greatly impaired, the tongue appears clean, the mouth is usually moist, and the thirst is inconsiderable. As the disease advances, the fauces put on rather an inflamed appearance, and are beset with aphthæ, and the red vessels of the tunica adnata become of a pearly white. During the exacerbations, a florid circumscribed redness appears on each cheek; but at other times the face is pale, and the countenance somewhat dejected. At the commencement of hectic fever, the belly is usually costive; but in the more advanced stages of it, a diarrhæa often comes on, and this continues to recur frequently during the remainder of the disease; colliquative sweats likewise break out, and these alternate with each other, and induce vast debility. In the last stage of the disease the emaciation is so great, that the patient has the appearance of a walking skeleton; his countenance is altered, his cheeks are prominent, his eyes look hollow and languid, his hair falls off, his nails are of a livid colour, and much incurvated, and his feet are affected with œdematous swellings. To the end of the disease the senses remain entire, and the mind is confident and full of hope. It is, indeed, a happy circumstance attendant on phthisis, that those who labour under it are seldom apprehensive or aware of any danger; and it is no uncommon occurrence to meet with persons labouring under its most advanced stage, flattering themselves with a speedy recovery, and forming distant projects under that vain hope. Some days before death the extremities become cold. In some cases a delirium precedes that event, and continues until life is extinguished.

As an expectoration of mucus from the lungs may possibly be mistaken for purulent matter, and may thereby give us reason to suspect that the patient labours under a confirmed phthisis, it may not be amiss to point out a sure crite-

tion, by which we shall always be able to distinguish the one from the other. The medical world are indebted to the late Mr. Charles Darwin for the discovery, who has directed the experiment to be made in the following manner :

Let the expectorated matter be dissolved in vitriolic acid, and in caustic lixivium, and add pure water to both solutions. If there is a fair precipitation in each, it is a certain sign of the presence of pus ; but if there is not a precipitation in either, it is certainly mucus.

Mr. Everard Home, in his dissertation on the properties of pus, informs us of a curious, and apparently a decisive mode of distinguishing accurately between pus and animal mucus. The property, he observes, which characterises pus, and distinguishes it from most other substances, is, its being composed of globules, which are visible when viewed through a microscope ; whereas animal mucus, and all chemical combinations of animal substances appear in the microscope to be made up of flakes. This property was first noticed by the late Mr. John Hunter.

Pulmonary consumption is in every case to be considered as attended with much danger ; but it is more so when it proceeds from tubercles, than when it arises in consequence either of hæmoptysis, or pneumonic suppuration. In the last instance the risk will be greater where the abscess breaks inwardly, and gives rise to empyema, than when its contents are discharged by the mouth. Even cases of this nature have, however, been known to terminate in immediate death. The impending danger is generally to be judged of, however, by the violence of the hectic symptoms ; but more particularly by the fetor of the expectoration, the degree of emaciation and debility, the colliquative sweats, and the diarrhæa. The disease has, in many cases, been found to be considerably retarded in its process by pregnancy ; and in a few has been alleviated by an attack of mania.

The morbid appearance most frequently to be met with on the dissections of those who die of phthisis, is the existence of tubercles in the cellular substance of the lungs. These are small tumours which have the appearance of indurated glands, are of different sizes, and are often found in clusters. Their firmness is usually in proportion to their size, and when laid open in this state they are of a white colour, and of a consistence nearly approaching to cartilage. Although indolent at first, they at length become inflamed, and are at last changed into little abscesses or vomicæ, which breaking, and pouring their contents into the bronchiæ, give rise to a purulent expectoration, and thus lay the foundation of phthisis. Such tubercles or vomicæ are most usually situated at the upper and back part of the lungs ; but in some instances they occupy the outer part, and then adhesions to the pleura are often formed.

When the disease is partial, only about a fourth of the upper and posterior part of the lungs is usually found diseased ; but in some

cases life has been protracted till not one twentieth part of them appeared, on dissection, fit for performing their function. A singular observation, confirmed by the morbid collections of anatomists, is, that the left lobe is much oftener affected than the right.

PHU. (*φῦ*, or *φῦ*, from *phu*, Arab.) See VALERIANA MAJOR.

PHUL, or PUL, king of Assyria, is by some historians said to be Ninus under another name, and the first founder of that monarchy : a renowned warrior. He invaded Israel in the reign of Manahem, who became tributary to him, and paid him 1000 talents of silver for a peace. Flourished 771 B. C.

PHUT, or PHUTH, the third son of Ham. (Gen. x. 6.) Calmet is of opinion, that Phut peopled either the canton of Pthemphu Pthemphuti, or Pthembuti, set down in Pliny and Ptolemy whose capital was Thara in Lower Egypt, inclining towards Lybia ; or the canton called Phtenotes, of which Buthus was the capital. The prophets often speak of Phut.

PHYGETHLON. (*phygethlon* *φυγέθλον* ; from *φυγ*, to grow.) A red and painful tubercle which often arises about the anus, and if badly treated becomes fistulous.

PHYLACTERY, in the general, was a name given by the ancients to all kinds of charms, spells, or characters, which they wore about them, as amulets, to preserve them from dangers or diseases.

PHYLACTERY particularly denoted a slip of parchment, wherein was written some text of Holy Scripture, particularly of the decalogue, which the more devout people among the Jews wore on the forehead, the breast, or the neck, as a mark of their religion. The primitive Christians also gave the name phylacteries to the cases wherein they inclosed the relics of their dead. Phylacteries are often mentioned in the New Testament, and appear to have been very common among the Pharisees in our Lord's time.

PHYLICA. Bastard alaternus. In botany, a genus of the class pentandria, order monogynia. Perianth five-parted, turbinate ; petalless ; but five small scales, one at the base of each division of the calyx ; capsule three-grained, inferior. Eighteen species ; all Cape or African plants, of which the following are cultivated.

1. *P. ericoides*. Heath-leaved phylica.
2. *P. plumosa*. Woolly-leaved phylica.
3. *P. buxifolia*. Box-leaved phylica.

They are tender shrubby plants propagated by cuttings and slips, and require the shelter of a green-house in winter. They do not produce seeds in this climate.

PHYLLACHNE, in botany, a genus of the class diccia, order monandria. Calyx double ; each two or three-leaved ; corol funnel-form, five-cleft. Male : filamentless ; anthers two, placed on the sides of the stigma. Fem. : stigma between the barren anthers ; capsule inferior, turbinate, many-seeded. One species ; a mossy plant of Terra del Fuego, with terminal sessile flowers.

PHYLLANTHUS. Sea-side laurel. In botany, a genus of the class monocæia, order triandria. Calyx six-parted, campanulate; corolless. Fem.: styles three, cloven; capsules three-celled; seeds solitary. Eleven species, natives of the East and West Indies. The following species are cultivated.

1. *P. niruri*. Annual phyllanthus.
2. *P. grandiflora*. Great-leaved phyllanthus.

3. *P. emblica*. Shrubby phyllanthus.

All these require artificial heat, and rise from twelve to fourteen feet high.

PHYLLIS, a daughter of Sithon, or of Lycurgus, king of Thrace, received Demophoon the son of Theseus, who, at his return from the Trojan war, had stopped on her coasts. She became enamoured of him, and did not find him insensible to her passion. After some months of mutual tenderness and affection, Demophoon set sail for Athens. He promised faithfully to return as soon as a month was expired, but violated his engagement; and the queen, grown desperate on account of his absence, hanged herself, or, according to others, threw herself into the sea. The absence of Demophoon from Phyllis has given rise to a beautiful epistle of Ovid.

PHYLLIS. Bastard hare's ear. In botany, a genus of the class pentandria, order digynia. Stigmas bristly; calyx two-leaved; corol five-petalled; seeds two. One species; a jointed shrub of the Canaries, with spear-shaped leaves, and terminal flowers in loose panicles.

PHYLLITIS (*phyllitis*, *φυλλιτις*; from *φυλλοι*, a leaf so called because the leaves only appear.) See **SCOLOPENDRIUM**.

PHYMA, (*phyma*, *φυμα*; from *ενω*, to produce.) Tubercles in any external part of the body.

PHYSALIS. Winter-cherry. In botany, a genus of the class pentandria, order monogynia. Corol wheel-shaped; stamens connivent; berry within an inflated calyx, two-celled. Seventeen species; natives of the south of Europe, both the Indies, or America. The following are cultivated.

1. *P. angulata*. Tooth-leaved winter-cherry.

2. *P. pubescens*. Woolly winter-cherry.

3. *P. alkekengi*. Common winter-cherry.

4. *P. Pensylvanica*. Pennsylvanian winter-cherry.

5. *P. viscosa*. Clammy winter-cherry.

6. *P. somnifera*. Clustered winter-cherry.

7. *P. flexuosa*. Flexuous Italian winter-cherry.

8. *P. arborescens*. Tree-like winter-cherry.

9. *P. Curassavica*. Curassavian winter-cherry.

The flowers are produced from the wings standing upon slender foot-stalks, of a white colour, and confined to a single petal. These are succeeded by round, cherry-shaped berries, inclosed in an inflated bladder, which turns red in autumn; when the top opens and discloses the red berry, which is soft, pulpy, and filled with flat kidney-shaped seeds. These

plants are all propagable by seeds, and are for the most part hardy: some of them are annual, the greater part perennial.

PHYSALUS, in mastiology. See **BALÆNA**.

PHYSCON, a surname of one of the Ptolemies kings of Egypt, from the great prominence of his belly (*φυσων, venter*.)

PHYSCONIA, (*physconia*, *φυσκωνια*; from *φυσκων*, a big-bellied fellow.) Enlargement of the abdomen. A genus of disease in the class cachexiæ, and order intumescentiæ of Cullen; known by a tumour occupying chiefly one part of the abdomen, increasing slowly, and neither sonorous nor fluctuating. Species: 1. hepatica. 2. Splenica. 3. Renalis. 4. Uterina. 5. Ab ovario. 6. Mesenterica. 7. Omentalis. 8. Visceralis.

PHYSETER. Cachalot. In zoology, a genus of the class mammalia, order cetæ. Teeth in the lower jaw; none in the upper. Four species as follow:

1. *P. macrocephalus*. Blunt-headed cachalot. Without dorsal fin; fistula on the neck. Three varieties.

α. Black; back gibbous.

6. Blackish ash; back gibbous.

γ. Whitish; back smooth.

Variety α inhabits the European seas; 6 the coasts of New England; γ Davis's straits. The first is sixty feet long, white beneath; teeth in the lower jaw forty-six, in a double row, received in sockets in the upper; teats retractile; from its head is procured spermaceti, and ambergris from the intestines of such as are sick. The second variety is from sixty to seventy feet long; head large; eyes small; teeth numerous. The third is from fifteen to sixteen feet long, yellowish white; teeth a little incurvate, compressed, rounded at the tips.

The first sometimes visits the British coasts: a dead one was cast ashore near Edinburgh in 1769, length fifty-four feet, greatest girth thirty feet.

The formidable conformation of the mouth and throat seems to indicate an extraordinary degree of voracity in these animals. The history of the cachalot corresponds to these appearances: for while the stomach of the whale is seen to contain hardly any thing but froth, that of the cachalot is crammed with a variety of different kinds of fishes; some half digested, others whole; some small, others eight or nine feet long. The cachalot, therefore, is probably one of the most rapacious fishes of the deep; and as destructive among the lesser tribes as the whale is harmless. But it is not to the smaller fishes alone that this animal is formidable; among these the contest is soon ended, for it can devour thousands at one swallow; it pursues and terrifies those of its own order, the dolphin, and the porpoise to such a degree, that they are frequently driven ashore in endeavouring to escape.

All the varieties of this species were indiscriminately termed spermaceti whales, till Mr. Pennant borrowed the name from the French, by which they are now distinguished.

From its size, as well as its fierceness and agility, the capture of the cachalot would seldom be attempted by fishermen, were it not for the sake of the spermaceti and ambergris, which they contain. The various purposes to which these substances are applied, both as drugs and articles of luxury, have rendered the cachalot, which supplies them, a fish in great request, and its capture is the most advantageous pursuit of the Greenland trade.

Spermaceti is a name erroneously given to the substance which is found in the head of the cachalot, and which instead of being the semen, is the brain of the animal. Goldsmith gives the following account of the method by which it is extracted. The outward skin of the head being taken off, a covering of fat appears, about three inches thick; under which, instead of a bony skull, the animal has only another thick skin, that serves for a covering and defence of the brain. The first cavity or chamber of the brain is filled with that kind of spermaceti which is supposed to be of the greatest purity, and is hence of the highest value. From this cavity there is generally drawn about seven barrels, and so perfect is the material that when thrown upon water it will coagulate like cheese. Below this there is another chamber, just over the gullet, which is about seven feet high; and this also contains spermaceti, but of less value. It is distributed in this cavity, like honey in a bee-hive, in small cells, separated from each other by a membrane like the inner skin of an egg. In proportion as the oily substance is drawn away from this part, it fills afresh from every part of the body; and from this is generally obtained about nine barrels of oil. Besides this, the spinal marrow, which is about as thick as a man's thigh, and reaches all along the backbone to the tail, where it dwindles to the size of one's finger, affords no inconsiderable quantity.

Formerly spermaceti was obtained but in small quantities, and was sold at a very high price, from the supposition of its great efficacy as a medicine. It still enters indeed into the compositions of pharmacy, but in a very subordinate character; and since the art of converting the whole oil of the cachalot into spermaceti by boiling has been discovered, the article has decreased rapidly in its value. It has now fallen below the price of wax, and is used instead of it for candles.

Ambergris, the second medicinal substance for which mankind are indebted to the cachalot, should rather have obtained the name of spermaceti, because it is found in the place where the seminal vessels of other animals are commonly situated. For a long time the world was taught to believe that ambergris was a substance to be found only in small quantities upon the surface of the water. The trade in these articles was originally in the hands of men of obscure and suspicious characters; and this was one of the arts by which they endeavoured to add to the mysterious nature and value of the commodity. Time, which re-

veals the secrets of the mercenary, has at last discovered that this medicine is the produce of the cetaceous fishes.

Among the intestines of the cachalot is found a bag three or four feet long, filled with liquor of a yellowish colour, and thinner than oil; and in this fluid the ambergris is seen floating in round lumps, from one to twenty pounds weight, the lumps never exceeding above four in the same fish. These balls of ambergris, the purposes of which in medicine and perfumes are so well known, are not indiscriminately found in every cachalot; it is only the oldest and strongest that yield it in any considerable quantity. See the article AMBERGRIS.

2. *P. catodon*. Lesser cachalot. Round-headed cachalot. Without dorsal fin: fistula on the snout. Inhabits the northern seas, rarely the Scottish coast: twenty-four feet long; head round; mouth small.

3. *P. microps*. Sharp-nosed cachalot. Dorsal fin long; upper jaw longer than the lower. Two varieties.

a. Teeth sharp, hooked.

ε. Teeth sharp, straight.

Both inhabit the northern seas: the first seventy feet long, dark tawny; teeth forty-two, a little compressed; dorsal fin long, sharp. The second from eighty to a hundred feet long, blackish above, whitish beneath; a high bunch on the upper part of the back; fin near the tail; eyes bright, yellowish; tongue small, acute; teeth set in the jaw like a saw. Found at times on our own coasts.

4. *P. tursis*. High-finned cachalot. Dorsal fin very long; teeth flat at the top. Inhabits the northern ocean, and has been found on the Scottish coast: a hundred feet long; the long dorsal fin sharp, erect, resembling the mast of a vessel; tongue sharp.

PHYSIC (Φυσική), the art of healing; properly called medicine.

The word is formed from *φύσις*, nature; because medicine consists, principally, in the observation of nature. For the rise, progress, division, &c. of physic, see MEDICINE.

To PHY'SIC. *v. n.* (from the noun.) To purge; to treat with physic; to cure (*Shakspeare*).

PHYSIC NUT, in botany. See JATROPHA.

PHYSICAL. *a.* (from *physic*.) 1. Relating to nature or to natural philosophy; not moral (*Hammond*). 2. Pertaining to the science of healing. 3. Medicinal; helpful to health (*Shakspeare*). 4. Resembling physic.

PHYSICALLY. *ad.* (from *physical*.) 1. According to nature; by natural operation; not morally (*Stillingfleet*). 2. According to the science or rules of medicine (*Cheyne*).

PHYSICIAN. *s.* (from *physic*.) One who professes the art of healing (*Prior*).

PHYSICO-MATHEMATICS, includes those branches of physic, which, uniting observation and experiment to mathematical calculation, undertake to explain the phenomena of nature. See MIXED MATHEMATICS.

P H Y S I C S.

PHYSICO-THEOLOGY: *s.* (from *physico*, and *theology*.) Divinity enforced or illustrated by natural philosophy.

PHYSICS, *physica, φυσικη*, derived from *φύσις*, nature, sometimes also called *physiology*, and *natural philosophy*, is the doctrine of natural bodies, their phenomena, causes, and effects, with the various affections, motions, operations, &c. thereof.

Mr. Locke would likewise have God, angels, and spirits, come under physics; but these are more usually referred to metaphysics.

The immediate and proper objects of physics are body, space, and motion.

The origin of physics is referred, by the Greeks, to the barbarians, viz. the brachmans, magi, and the Hebrew and Egyptian priests.

From these it was derived to the Greek sages or sophi, particularly to Thales, who is said to have first professed the study of nature in Greece.

Hence it descended into the Pythagoric, Platonick, and Peripatetic schools; whence it was propagated into Italy, and thence through the rest of Europe: though the druids, bards, &c. had a sort of systems of physics of their own.

Physics has been divided, with regard to the manner wherein it has been handled, and the persons by whom, into

Symbolical Physics, or such as was couched in symbols: such was that of the old Egyptians, Pythagoreans, and Platonists, who delivered the properties of natural bodies under arithmetical and geometrical characters, and hieroglyphics.

Peripatetical, or that of the Aristotelians, who explained the nature of things by matter, form, and privation, elementary and occult qualities, sympathies, antipathies, attractions, &c. See ARISTOTELIAN and PERIPATETICS.

Experimental, which enquires into the reasons and natures of things from experiments; such as those in chemistry, hydrostatics, pneumatics, optics, &c. See EXPERIMENTAL PHILOSOPHY.

And, finally, *mechanical* or *corpuscular*, which explains the appearances of nature from the matter, motion, structure, and figure of bodies, and their parts; all according to the settled laws of nature and mechanics.

By the constitution of our mind, we consider the employment of means, by which ends terminating in the agent are gained, as the natural signs of design or intention. Art, therefore, or the employment of means, is the natural sign of intention; and wherever we observe this adjustment of means to ends we infer the agency of design.

A small acquaintance with the objects around us, obliges us to extend this inference to a great number of beings, besides our fellow men, namely, to the whole animal creation; for in all we observe the same subserviency to the ends of the agent, in the changes which we find them continually producing in the objects around them. These changes are all adjusted to their own well-being. In all such cases, therefore, we are forced, by the constitution of our own minds, to infer the existence of design or intention in these beings also.

But in numberless changes produced by external objects on each other, we observe no such fitness in the effects, no such subserviency to the well-being of the agent. In such cases, therefore, we make no such inference of thought or design.

Thus, then, there is presented to our observa-

tion an important distinction, by which we arrange all external objects into two classes. The first resembles ourselves, in giving external marks of that thought or intention of which we are conscious; and we suppose in them the other properties which we discover in ourselves, but cannot immediately observe in them, viz. thought, perception, memory, foresight, and all that collection of faculties which we feel in ourselves, and which constitute the animal. Objects of the other class exhibit no such appearances, and we make no such inference. And thus we divide the whole of external nature into the classes of thinking and unthinking beings.

Our first judgments about these classes will be very inaccurate; and we shall naturally ascribe the differences, which we do not very well understand, to the differences in organical structure, which we clearly observe. But when we have knocked down or perhaps smothered an animal, we find that it no longer gives the former marks of thought and intention, and that it now resembles the class of unthinking beings: and yet it still retains all that fitness of organical structure which it had before; it seems only to want the intention and the will. This obliges us to conclude that the distinction does not arise from a difference in organical structure, but from a distinct substance common to all thinking beings, but separable from their organical frame. To this substance we ascribe thought, intention, contrivance, and all that collection of faculties, which we feel in ourselves. To this substance in ourselves we refer all sensations, pleasures, pains, remembrances, desires, purposes; and to this aggregate, however imperfectly understood, we give the name *mind*. Our organical frame, which seems to be only the instrument of information and operation to the mind, we call our body.

As the animating principle is not, like our body, the immediate object of the senses, we naturally conceive it to be a substance essentially different from those which are the objects of our senses. The rudest people have shown a disposition to form this conclusion. Observing that animal life was connected with breathing, it was natural to imagine that breathing was living, and that breath was life. It is a remarkable fact that in most languages the term for expressing breath is at least one of the terms for expressing the soul; *πνεύμα*, *spiritus*, in the Hebrew, Greek, and Latin, express both; *ghetst* or *ghost*, in the Teutonic, comes from *gheisen*, to breathe or sigh; *ducha* or *duah*, the soul, in Slavonic, comes from *duichat*, to breathe; so in the Gaelic does *anal* come from *anam*; and the same relation is found between the two words in the Malay and other eastern languages. We believe that most persons can recollect some traces of this notion in their early conceptions of things; and many who do not consider themselves as uncultivated, believe that the soul quits the body along with the last breath. Among the Tartar nations hanging is considered with particular horror, on account of the ungraceful and filthy exit which the soul is obliged to make from the body.

But the observation of the same appearances of thought and intention in fishes and other animals which do not breathe would soon show that this was but a rude conception. Very little refinement indeed is necessary to convince us that air or breath cannot be the substance which thinks, wishes, and designs; and that the properties of this substance, whatever it is, must be totally different from, and

incompatible with, any thing that we know of the immediate objects of our senses.

Hence we are led to conclude that there are two kinds of substances in nature: one, which is the principle of sensation; and therefore cannot be the object of our senses, any more than light can be the object of the microscope. This substance alone can feel, think, desire, and propose, and is the object of reflection alone. The objects of our senses compose the other class, and therefore can have none of the other properties which are not cognoscible by the senses. These have all the properties which our senses can discover; and we can have no evidence of their having any other, nor indeed any conception of their having them. This class is not confined to the unorganized masses of matter; for we see that the bodies of animals lose after death that organical form, and are assimilated to all the rest of unthinking beings. It has arisen from such views as this, that while all nations have agreed to call this class of objects by the name body, which originally expresses our organical frame, some nations, further advanced in cultivation or refinement, have contrived an abstract term to express this general substance of which all inanimate beings are composed. Such a term we have in the words *materies*, *οὐκ*.

Matter, then, is that substance which is immediately cognoscible by our senses. Whatever, therefore, is not thus immediately cognoscible by our senses is not material, and is expressed by a negative term, and called immaterial: hence it is that mind is said to be immaterial. It is of importance to keep in mind this distinction, merely grammatical. Little more is necessary for detecting the sophisms of Helvetius, Mirabeau, and other sages of the Gallic school, who have been anxious to remove the ties of moral and religious obligation by lowering our conceptions of our intellectual nature. It will also serve to show how hastily they have formed their opinions who have ascribed to the immediate agency of mind all those relations which are observed in the actions of bodies on each other at a distance. The connecting principles of such relations *e distante* (if there are any such) are not the immediate objects of our senses: they are therefore immaterial. But it does not follow that they are minds. There may be many immaterial substances which are not minds. We know nothing of any object whatever but by the observation of certain appearances, which suggest to our minds the existence and agency of its qualities or powers. Such phenomena are the natural signs of these qualities, and it is to those signs that we must always have recourse when we wish to conceive without ambiguity concerning them. What is the characteristic phenomenon of mind, or what is the distinguishing quality which brings it into view? it is *intention*: and it may be asserted with the utmost confidence, that we have no other mark by which mind is immediately suggested to us, or that would ever have made us suppose that there existed another mind besides our own. The phenomenon by which this quality is suggested to us is art, or the employment of means to gain ends; and the mark of art is the supposed conduciveness of these ends to the well-being of the agent. Where this train is not observed, design or intention is never thought of; and therefore where intention is not perceived in any immaterial substance, if any such has ever been observed, it is an abuse of language to call it mind. We do not think that even perception and intelligence entitle us to give the name mind to

the substance in which they are inherent, because it is from marks of intention alone that we infer the existence of mind; and although these must be accompanied with perception and intelligence, it does not follow that the substance which can perceive and understand must also desire and propose. However difficult we may find it to separate them, they are evidently separable in imagination. And let not this assertion be too hastily objected to; for the separation has been made by persons most eminent for their knowledge and discernment. When Leibnitz ascribed to his monads, or what we call the ultimate atoms of matter, a perception of their situation in the universe, and a motion precisely suited to this perception, he was the furthest in the world from supposing them animated or endowed with minds.

The term mind, in the ordinary language of all men, is applied to what desires and wills at the same time that it perceives and understands. If we call that mind which produces motion, we must derive our notions of its qualities or attributes from observing their effects. We must therefore discover the general laws by which they act, that is, the general laws observed in those motions which we consider as their effects. Now these are the general laws of motion; and in none of these can we find the least coincidence with what we are accustomed to call the laws of mind. Nay, it has been the total want of similarity which has given rise to the distinction which all men, in all ages and countries, have made between mind and matter. This distinction is found in all languages; and it is an unpardonable liberty which men take with languages when they use a term of distinction, a specific term, to express things of a different species. What these authors have been pleased to call mind, the whole world besides have called by another name, force; which, though borrowed from our own exertions, is yet sufficiently distinctive, and never leads us to confound things that are different, except in the language of some modern philosophers, who apply it to the laws of the agency of mind; and, when speaking of the force of motives, &c. commit the same mistakes which the followers of Aristotle commit in the use of the term mind. Force, in the language of these philosophers, means what connects the operations of mind; as mind, in the language of lord Monboddo, is that which connects the operations of body.

Those are not less to blame who consider this nature of Aristotle, this principle of motion, as an existence of substance different both from matter and from the minds of intelligent creatures. Aristotle calls it in some places, *ωσπερ ψυχη*. He might with equal propriety, and equal consistency with his other doctrines, have called mind *ωσπερ τελος*, or an *ωσπερ, δυναμις*. Besides, we have no evidence for the separability of this *ωσπερ ψυχη* from body, as we have for the inseparability of such minds as our own, the genuine *ψυχαι*. Nay, his whole doctrines, when maturely considered, assume their absolute inseparability.

This doctrine of elemental minds, therefore, as the immediate causes of the phenomena of the material world, is an abuse of language. It is a jargon; and it is a frivolous abuse, for it offers no explanation whatever. The phenomena are totally unlike the phenomena of ordinary minds, and therefore receive no explanation from them; and since our knowledge of these *quasi* minds must be entirely derived from the phenomena, it will be precisely the same, although we express it in com-

mon language. We shall not indeed raise the wonder of our hearers, as those do who fill the world with minds which they never suspected to exist; but we shall not bewilder their imagination, confound their ideas, and mislead their judgments.

We flatter ourselves that our readers will not think these observations unseasonable or misplaced. Of all mistakes that the naturalist can fall into, there is none more fatal to his progress in knowledge than the confounding things which are essentially different; and of all the distinctions which can be made among the objections of our contemplation, there is none of equal philosophical importance with this between mind and matter: and when we consider the consequences which naturally follow from this confusion of ideas, and particularly those which follow from sinking the mental faculties of man to a level with the operations of mechanics or chemistry, consequences which the experience of the present eventful day shows to be destructive of all that is noble or desirable in human nature, and of all that is comfortable in this life, and which blast every hope of future excellence—we cannot be too anxious to have this capital distinction put in the plainest point of view, and expressed in the most familiar characters, “so that he who runs may read.”

Such is the scene of our observation, the subject of philosophical study. Its extent is almost unbounded, reaching from an atom to God himself. It is absolutely necessary for the successful cultivation of this immense field of knowledge that it be committed to the care of different cultivators, and that its various portions be treated in different ways: and, accordingly, the various tastes of men have given this curiosity different directions; and the study, like all other tasks, has been promoted by this division of labour.

Some philosophers have attended only to the appearances of fitness which are exhibited in every quarter of the universe; and by arranging these into different classes, and interpreting them as indications of thought and intention, have acquired the knowledge of many classes of sentient and intelligent beings, actuated by propensities, and directed by reason.

While the contemplation of these appearances indicates thought and design in any individual of one of these classes, and brings its propensities and purposes of action, and the ends gained by these actions, into view, the contemplation of these propensities, purposes, and ends, occasions an inference of a much more general kind. All these intelligent beings give indications of knowledge and of power; but their knowledge bears in general no proportion to their power of producing changes in nature, and of attaining important ends; and their power is neither always, nor in the most important cases, the consequence of their knowledge. Where the effect of their actions is most eminently conducive to their important interests, the power of attaining these valuable ends is generally independent on any attention to the fitness of the means, and the exertion is frequently made without even thinking of the important end. The well-being of the individual is secured against any danger from its ignorance, indolence, or inattention, by an instinctive propensity, which leads it to the performance of the necessary action, which is thus made immediately and ultimately desirable, without any regard to its ultimate and important end. Thus, in our own nature, the support of animal life, and the improvement of the means of subsistence by a knowledge of the objects

which surround us, are not intrusted to our apprehensions of the importance of these ends, but are committed to the surer guides of hunger and curiosity.

The same observers discover a connection between the individuals of a class, different from that which arises from the mere resemblance of their external appearance, or even of their propensities and pursuits: the very circumstances which produced the classification. They observe, that these propensities are such, that while each individual seeks only its own enjoyment, these enjoyments are in general such as contribute to the support of the species and the enjoyment of other individuals. Thus, in the classes of animals, and in human nature, the continuance of the race, and the enjoyment of the whole, are not entrusted to the apprehension we entertain of the importance of these ends, but are produced by the operation of sexual love and the love of society.

The same observers find that even the different classes of sentient beings are connected together; and while the whole of each class aim only at their own enjoyment, they contribute, in some way or other, to the well-being of the other classes. Even man, the selfish lord of this sublunary world, is not the unconnected inhabitant of it. He cannot, in every instance, reap all the fruits of his situation, without contributing to the enjoyment of thousands of the brute creation. Nay, it may be proved, to the satisfaction of every intelligent man, that while one race of animals, in consequence of its peculiar propensities, subsists by the destruction of another, the sum-total of animal life and enjoyment is prodigiously increased. See a very judicious dissertation on this curious and puzzling subject, entitled *A Philosophical Survey of the Animal Creation*; where it appears that the increase of animal life and enjoyment which is produced by this means, beyond what could possibly obtain without it, is beyond all conception. See likewise the last edition of *King's Origin of Evil*, by Dr. Law, late bishop of Carlisle.

Thus the whole assemblage seems connected, and jointly employed in increasing the sum-total of possible happiness. This fitness of the various propensities of sentient and intelligent beings, this subserviency to a general purpose, strikes these observers as a mark of intention, evidently distinct from, and independent of, all the particular intentions, and superior to them all; and thus it irresistibly leads them to infer the existence of a supreme mind, directing the whole of this intellectual system, while the individuals of which it consists appear the unconscious instruments in the hand of a great artist, with which he executes his grand and beneficent purposes.

But the observation goes yet further. The bodies of the inanimate creation are not only connected with each other by a mutual dependence of properties, and the relation of causation, but they are also connected with the sentient beings by a subserviency to their purposes of enjoyment. The philosopher observes that this connection is admirably kept up by the constancy of natural operations, and the expectations of intelligent beings. Had either of these circumstances been wanting, had either the operations of nature been without rule, or had sentient beings no perception or expectation of their uniformity, the subserviency would be totally at an end. This adjustment, this fitness, of which the effect is the enjoyment of the sentient inhabitants of the universe, appears to be the effect of an intention of which this enjoyment is

PHYSICS.

the final cause. This constancy therefore in the operations of nature, both in the intellectual and material world, and the concomitant expectation of sentient beings, appear the effects of laws imposed on the different parts of the universe by the Supreme Mind, who has formed both these classes of beings so admirably suited to each other.

To such observers the world appears a work of art, a system of means employed for gaining certain proposed ends, and it carries the thoughts forward to an artist; and we infer a degree of skill, power, and good intention in this artist, proportioned to the ingenuity, extent, and happy effect which we are able to discern in his works. Such a contemplation of nature, therefore, terminates in natural theology, or the discovery of the existence and attributes of God.

Our notions of the Supreme Mind are formed from the indications of design which we observe, and which we interpret in the same way as in the actions of men. These notions, therefore, will differ from our notions of other minds only in the degrees which we are able to observe, and which we assign to these faculties; for the phenomenon or the effect is not only the mark, but also the measure, of its supposed cause. These degrees must be ascertained by our own capacity of appreciating the extent, the multiplicity, and the variety of the contrivance. Accordingly, the attributes of the Supreme Mind, in the theological creed of a rude Indian, are much more limited than in that of an European philosopher. In proportion as our understandings are enlarged, and as our acquaintance with the operations of nature around us is extended, we shall perceive higher degrees of power, of skill, and of kind intention: and since we find that the scene of observation is unbounded, we cannot affix any boundaries to these attributes in our own imagination, and we are ready to suppose that they are infinite or unbounded in their own nature. When our attentive survey of this universe, and a careful comparison of all its parts, as far as we can understand or appreciate them, have made us conclude that it is one design, the work of one artist; we are under the necessity of inferring, that, with respect to this universe, his power, wisdom, and benevolence, are indeed infinite.

When men have been led to draw this conclusion from the appearances of fitness which are observed every where around them, they consider that constancy which they observe in natural operations, whether in the material or the intellectual system, and that expectation of, and confidence in, this constancy, which renders the universe a source of enjoyment to its sentient inhabitants, as the consequences of laws imposed by the Almighty artist on his works, in the same manner as they would consider the constancy in the conduct of any people as the consequences of laws promulgated and enforced by the supreme magistrate.

There can be no doubt of this view of nature being extremely captivating, and likely to engage the curiosity of speculative men; and it is not surprising that the phenomena of mind have been keenly studied in all ages.

The occupations, however, of ordinary life have oftener directed our efforts towards material objects, and engaged our attention on their properties and relations; and as all sciences have arisen from arts, and were originally implied in the maxims and precepts of those arts, till separated from them by the curious speculatist, the knowledge of the material system of nature was possessed in de-

tached scraps by the practitioners in the various arts of life long before the natural philosopher thought of collecting them into a body of scientific doctrines. But there have not been wanting in all ages men of curiosity who have been struck by the uniformity of the operations of nature in the material world, and were eager to discover their causes.

Accordingly, while the moralists and metaphysicians turned their whole attention to the phenomena of mind, and have produced the sciences of pneumatology, logic, ethics, jurisprudence, and natural theology, these observers of nature have found sufficient employment in considering the phenomena of the material world.

The bodies of, which it consists are evidently connected by means of those properties by which we observe that they produce changes in each other's situation. This assemblage of objects may therefore be justly called a system. We may call it the material system. It is frequently termed nature; and the terms natural appearances, natural causes, natural laws, have been generally restricted to those which take place in the material system. This restriction, however, is improper, because there is no difference in the manner in which we form our notions of those laws, and reason from them, both with respect to mind and body. Or if there is to be any restriction, and if any part of the study of the universe is to be excluded in the application of these terms, it is that part only which considers moral obligation, and rather treats of what ought to be than of what is. As has been already observed, there is a considerable difference in the language which must be employed; but still there is none in the principles of investigation. We have no proof of the extent of any moral law but an appeal to the feelings of the hearts of men, indicated by the general laws or facts which are observed in their actions.

But this is only a question of the propriety of language. And no great inconvenience would arise from the restriction now mentioned if it were scrupulously adhered to; but unfortunately this is not always the case. Some authors use the term natural law to express every coincidence of fact; and this is certainly the proper use of the term. The French writers generally use the term *loi physique* in this enlarged sense. But many authors, misled by, or taking advantage of, the ambiguity of language, after having established a law founded on a copious and perhaps unexpected induction of the phenomena of the material system (in which case it must be considered in its restricted sense), have, in their explanation of phenomena, extended their principle much farther than the induction on which they had founded the existence of the physical law. They have extended it to the phenomena of mind, and have led their followers into great and dangerous mistakes. Languages, like every other production of human skill, are imperfect. They are deficient in terms, and therefore figurative. The most obvious, the most frequent and the most interesting uses of language, have always produced the appropriate terms, and the progress of cultivation has never completely supplied new ones. There are certain analogies or resemblances, or certain associations of ideas, so plain, that a term appropriated to one very familiar object will serve to suggest another analogous to it, when aided by the concomitant circumstances of the discourse; and this with sufficient precision for the ordinary purposes of social communication, and without leading us into any considerable mistakes; and it is

P H Y S I C S.

only the rare and refined disquisitions of the curious speculatist that bring the poverty and imperfection of language into view, and make us wish for words as numerous as our thoughts. There is hardly a sentence even of common discourse, in which there are not several figures either of single words or of phrases; and when very accurate discrimination is required, it is almost impossible to find words or phrases to express distinctions which we clearly feel. We believe it impossible to express, by the scanty vocabulary of the Hebrews, the nice distinctions of thought which are now familiar to the European philosopher. In nothing does this imperfection of language appear so remarkably as in what relates to mind. Being a late subject of separate discussion, and interesting only to a few speculatists, we have no appropriated vocabulary for it; and all our disquisitions concerning its operations are in continual metaphor or figure, depending on very slight analogies or resemblances to the phenomena of the material world. This makes the utmost caution necessary; and it justifies the British philosophers, who have been the most successful in prosecuting the study of the intellectual system, for having, almost without exception, restricted the terms natural laws, natural causes, natural philosophy, and such like, to the material system. With us pneumatology makes no part of physics. And we may venture to affirm, that the sciences have fared better by the restriction of the terms. In no country has the spirit of liberal discussion been more encouraged and indulged than in Britain; and her philosophers have been equally eminent in both branches of science. Their performances in ethics, jurisprudence, and natural theology, are considered by all our neighbours as the fountains of knowledge on these subjects; and Locke and Clarke are names no less familiar on the continent than Newton. The licentious and degrading doctrines of the Gallican schools have as yet made little impression here; and man is still considered among us as a glorious creature, born to, and fitted for, the noblest prospects.

Physics, then, is with us the study of the material system, including both natural history and philosophy. The term is not indeed very familiar in our language; and in place of *physicus* and *disciplina physica*, we more generally use the terms naturalist and natural knowledge. The term natural philosophy, in its common acceptance, is of less extent. The field of physical investigation is still of prodigious extent; and its different quarters require very different treatments, make very different returns, and accordingly have engaged in their particular cultivation persons of very different talents and tastes. It is of some importance to perceive the distinctions, and to see how the wants and propensities of men have led them into the different paths of investigation; for, as has been more than once observed, all sciences have sprung from the humble arts of life, and both go on improving by means of a close and constant correspondence.

All the phenomena of the material system may be arranged into two classes, distinguished both by their objects and by the proper manner of treating them.

The first class comprehends all the appearances which are exhibited in the sensible motions of bodies, and their actions on each other producing sensible motion.

The second class comprehends the appearances which are exhibited in the insensible motions

and actions of the invisible particles of matter.

Of the phenomena of the first class we have examples in the planetary motions, the motions of heavy bodies, the phenomena of impulse, the motions and actions of machines, the pressure and motions of fluids, the sensible actions of magnetical and electrical bodies, and the motions of light.

We have examples of the second class in the phenomena of heat and mixture, and those exhibited in the growth of animals and vegetables, and many phenomena of solid, fluid, magnetical, electrical, and luminous bodies, in which no change of place can be observed.

Thus it appears that there is a distinction in the phenomena sufficiently great to warrant a division of the study, and to make us expect a more rapid improvement by this division. Nay, the division has been made by nature herself, in the acquaintance which men have attained with her operations without study, before science appeared, and while art constituted all our knowledge.

In both classes of phenomena already distinguished we must grant, that the principle which connects the pairs of concomitant events, rendering the one the inseparable companion of the other, is totally unknown to us, because it is not the immediate object of our perception.

But in the phenomena of the first class, we see the immediate exertion of this principle, whatever it may be; we can observe the exertion with accuracy; we can determine its kind and degree, which are the signs and measures of the kind and degree of the unperceived cause. This exertion, being always some modification of motion, allows us to call in the aid of mathematical knowledge, and thus to ascertain with the precision peculiar to that science the energy of the cause, judging of the tendency and quantity by the tendency and the quantity of the observed effect.

But in the second class of phenomena the case is very different. In the operations of chemistry, for instance, the immediate exertion of the cause is not perceived: all that we observe is the assemblage of particles which obtains before mixture, and that which takes place when it is completed, and which we consider as its result. The procedure of nature in producing the change is unseen and unknown. The steps are hid from our observation. We are not only ignorant of the cause which determines one particle of our food to become a part of our body, while others are rejected, but we do not see the operation. We are not only ignorant of the cause which determines a particle of vitriolic acid to quit the fossil alkali with which it is united in Glauber salt, and to attach itself to a particle of magnesia already united with the muriatic acid, which also quits it to unite with the alkali, but we do not see the operation. The particles and their motions are not the objects of our senses; and all that we see is the Epsom salt and common salt separate from the water in which we had formerly dissolved the sal mirabile and the muriated magnesia. The motions, which are the immediate effects of the changing causes, and therefore their only indications, characteristics, and measures, fitted to show their nature, are hid from our view.

Our knowledge therefore of these phenomena must be less perfect than that of the phenomena of the former class; and we must here content ourselves with the discovery of more remote relations and remote causes, and with our ignorance

P H Y S I C S.

of the very powers of nature by which these changes are brought about, and which are cognoscible only by their immediate effects, viz. the motions which they produce unseen. The knowledge which we do really acquire is somewhat similar to what the mechanical philosopher has acquired when he has discovered, by many experiments and investigations, that magnets attract each other by their dissimilar poles, and repel each other by their similar poles, and do not act at all on any bodies but loadstones and iron. Here we leave undiscovered all that is most curious in the phenomenon, viz. how these attractions and repulsions are produced; and even here the magnetical philosopher has the advantage of seeing the agents and the operation.

But philosophers attending to this circumstance, that, even in these cases, the changes are produced by motions, or consist in motions, however unperceived these may be, have concluded, that the laws according to which nature operates in producing these changes are similar to the laws which regulate her operations in the sensible actions of bodies, or are included in them; and that the motions, though unseen, and the moving forces, are perfectly similar. They have therefore employed similar modes of investigation, applying the laws of impulse, and calling in the aid of mathematical knowledge.

Of this we have many examples in the writings of Dr. Freind, Keil, Bernoulli, Helsham, Boerhaave, Hartley, and others, who have delivered theories of fermentation, solution, precipitation, crystallization, nutrition, secretion, muscular action, nay even of sensation and intelligence, founded, as they think, on the laws of motion, and illustrated and supported by mathematical reasoning. Lord Bacon himself, that careful and sagacious distinguisher of intellectual operations, has gone into the same track in his explanation of the phenomena of fire and combustion; and sir Isaac Newton has made several attempts of the same kind, although with peculiarities which always characterise his discussions, and make them very different from those of an inferior class.

But the success of these philosophers has hitherto been very discouraging: indeed they had no title to expect any; for their whole trains of reasoning have proceeded on analogies which were not observed, but assumed or supposed without any authority. There is not that similarity in the phenomenon, or in the visible effect, which is absolutely necessary for a successful reasoning by analogy. We do not observe any local motion, any change of place, which alone enables us to reason mathematically on the subject. And to make the case desperate, this ill-founded analogy has been mixed with hypotheses completely gratuitous. Certain forms have been assigned to the particles, and certain modes of action have been laid down from them, for whose reality we have not the least argument or indication: and to complete the matter, these fancied forms and laws of action have been such as are either self-contradictory and inconsistent, or they have been such as, if allowed to act in a way analogous to what we observe in the sensible motions of bodies, would produce effects totally different from those which are observed. These atomical theories, as they are called, transgress every rule of philosophical discussion, and even the best of them are little better than trifling amusements. By far the greatest part of them only serve to raise a smile of pity and contempt in every person at all acquainted

with mechanical philosophy. Whenever we see an author attempting to explain these hidden operations of nature by invisible fluids, by æthers, by collisions, and vibrations, and particularly if we see him introducing mathematical reasonings into such explanations—the best thing we can do is to shut the book, and take to some other subject. That we may not be thought to speak presumptuously on this occasion, we only beg leave to remind our readers, that the united knowledge of the most eminent mathematicians of Europe has not yet been able to give any thing more than an approximation to the solution of the problem of three bodies; that is, to determine with accuracy the motions of three particles of matter acting on each other in the simplest of all possible manners, viz. by forces varying as the squares of the distances inversely: and the vibrations of elastic bodies, of any but the very simplest possible forms, are to this day beyond the reach of investigation. What then should be our expectations in cases where millions of particles are acting at once, of forms unobserved, and with forces unknown, and where the object is not a determination of an average result of many, where the precise state of an individual particle need not be known, but where it is this very precise state of each single particle that we want to know? What can it be but uncertainty and mistake?

Notwithstanding these discouraging circumstances, we must observe that this kind of enquiry has greatly improved of late years, along with the improvement and extension of mathematical philosophy, and since philosophers have given over their incessant attempts to explain every thing by impulse; and we need not despair of making still farther advances, if we will content ourselves with going no farther than Newton has done in his explanation of the planetary motions. He has immortalized his own name, and has added immensely to our stock of useful knowledge; yet he has stopped short at the discovery of the fact of universal gravitation; and all who have endeavoured to explain or account for this fact have only exposed themselves to pity. We may perhaps be one day able to demonstrate from the phenomena that the particles of matter have certain mutual tendencies to or from each other, exerted according to fixed or invaried rules; and from these tendencies we may be able to explain many other phenomena, and predict the consequences, with as much certainty and evidence as an astronomer calculates a future eclipse. This would be a great acquisition, and perhaps more is impossible: and the road to this has been hinted by sir Isaac Newton, who has expressed his suspicion, that as the great movements of the solar system are regulated by universal gravitation, so the mutual actions of the particles of matter are produced and regulated by tendencies of a similar kind, equally but not more inexplicable, and of which the laws of action are to be discovered by as careful an attention to the phenomena, and by the same patient thinking, which he has employed on the planetary motions.

But we have many steps to make before we begin this study: nature opens to us an immense volume; and we doubt not that our posterity will long find employment in the perusal, even though advancing with the eagerness and success of the last century. We have not yet arrived at the threshold in many parts of this research: in many parts of chemistry, for instance, we are as yet uncertain with respect to the phenomena themselves,

PHYSICS.

which are to be the subjects of this discussion. The composition of bodies must be fully understood before we begin to speak of the forces which unite their particles, or speculate about their modes of action. So long as water was considered as an element, we were ignorant of the forces inherent in its particles; we are perhaps still ignorant of this; but we now know that they are extremely different from what we formerly supposed them to be. It is but in a very few, if in any, cases of chemical combination, that we even know what are the ingredients: till we know this, it is too soon to speculate about their mode of union. Our ignorance of the real events in the animal and vegetable economy is still greater. Our first task therefore is to proceed, as we are now doing, in the accurate examination and classification of the phenomena themselves; and, without attempting to bring them within the pale of mathematical philosophy, by attempting what are called mechanical explanations, let us give up the consideration of these hidden operations, and augment to the utmost our list of secondary laws of visible but remote connections. All the mechanical speculations of the honourable Robert Boyle about the sensible qualities of things are now forgotten; but his chemical experiments preserve all their value, and are frequently referred to. The same may be said of the sagacious Dr. Hales, whose fanciful notions of internal conflicts, and collisions, and vibrations, derogate nothing from the value of the curious facts which he has established both in the animal and vegetable economy.

This distinction in the nature of the phenomena, and this difference in the nature of the knowledge which is to be acquired, and the means which are to be employed for the successful prosecution of these two branches of general physics, has occasioned a still farther restriction (at least in Britain) of the term natural philosophy. It is particularly applied to the study of the phenomena of the first class, while those of the second have produced the sciences of chemistry and physiology.

Natural philosophy and chemistry have generally been made particular institutions in our seminaries of learning, but physiology has more commonly been taught in conjunction with anatomy, medicine and botany.

The phenomena of the first class have been usually called mechanical, in order to distinguish them from those observed in the operations of chemistry, and in the animal and vegetable economy; and the explanations which have been attempted of some of the last, by applying the laws observed in the phenomena of the first class, have been called mechanical explanations.

As this first class is evidently but a part of general physics, there is some impropriety in giving the name natural philosophy to a course of doctrines which is confined to these alone. Indeed at the first institution of universities, the lectures given in the Schola Physica were much more extensive, comprehending almost all the phenomena of the material world: but as all arts and sciences have improved most where the labour has been most divided, it was found more conducive to the advancement of knowledge that separate institutions should be founded for the studies of natural history, chemistry, physiology, &c.; and thus the phenomena, purely mechanical, and a few others in magnetism, electricity, and optics, which either were susceptible of mathematical treatment, or had little connection with the studies of chemistry and physiology, were

left to the care of the professor of natural philosophy.

As the terms chemistry and physiology have been applied to two very important branches of general physics, we think that a more specific or characteristic name might be appropriated to the other, and that it might very properly be termed mechanical philosophy.

It only remains to make a few observations on the distinctive means of prosecuting these studies with success, and to point out some of the advantages which may reasonably be expected from a careful prosecution of them: and as the second branch has been fully treated under the several articles of CHEMISTRY, PHYSIOLOGY, &c. we shall confine ourselves to what is usually called natural philosophy.

Mechanical philosophy may, in conformity with the foregoing observations, be defined, "the study of the sensible motions of the bodies of the universe, and of their actions producing sensible motions, with a view to discover their causes, to explain subordinate phenomena, and to improve art."

The principle upon which all philosophical discussion proceeds is, that every change which we observe in the condition of things is considered by us as an effect, indicating the agency, characterising the kind, and measuring the degree of its cause.

In the language of mechanical philosophy, the cause of any change of motion is called a moving or changing force.

The disquisitions of natural philosophy must therefore begin with the consideration of motion, carefully noticing every affection or quality of it, so as to establish marks and measures of every change of which it is susceptible; for these are the only marks and measures of the changing forces. This being done, it only remains to apply them to the motions which we observe in the universe.

From the general principle of philosophical discussion already mentioned, there flow directly two axioms.

1. Every body perseveres in a state of rest or of uniform rectilinear motion, unless affected by some moving force.

2. Every change of motion is in the direction and in the degree of the force impressed.

These are usually called the laws of motion. They are more properly laws of human judgment, with respect to motion. Perhaps they are necessary truths, unless it be alleged that the general principle, of which they are necessary consequences, is itself a contingent though universal truth.

By these two axioms, applied *in abstracto* to every variety of motion, we establish a system of general doctrines concerning motions, according as they are simple or compounded, accelerated, retarded, rectilinear, curvilinear, in single bodies; or in systems of connected bodies; and we obtain corresponding characteristics and measures of accelerating or retarding forces, centripetal or centrifugal, simple or compound.

We have an illustrious example of this abstract system of motion and moving forces in the first book of sir Isaac Newton's Mathematical Principles of Natural Philosophy. Euler's *Mechanica sive Scientia Motus*, Herman's *Phoronomia sive de Veribus Corporum*, and D'Alembert's *Traité de Dynamique*, are also excellent works of the same kind. In this abstract system no regard

PHYSICS.

is paid to the casual differences of moving forces, or the sources from which they arise. It is enough to characterise a double accelerating force, for instance, that it produces a double acceleration: It may be a weight, a stream of water, the pressure of a man; and the force, of which it is said to be double, may be the attraction of a magnet, a current of air, or the action of a spring.

Having established these general doctrines, the philosopher now applies them to the general phenomena of the universe, in order to discover the nature of the forces which really exist, and the laws by which their operations are regulated, and to explain interesting but subordinate phenomena. This is the chief business of the mechanical philosopher; and it may with some propriety be called the mechanical history of nature.

Some method must be followed in this history of mechanical nature. The phenomena must be classed by means of their resemblances, which infer a resemblance in their causes, and these classes must be arranged according to some principle. We have seen no method which appears to us less exceptionable than the following.

The principle of arrangement is the generality of the phenomena; and the propriety of adopting this principle arises from the probability which it gives us of more readily discovering the most general actuating forces, whose agency is implicated in all other phenomena of less extent; and therefore should be previously discussed, that we may detect the discriminating circumstances which serve to characterise the subordinate phenomena, and are thus the marks of the distinguishing and inferior natural powers.

The most general of all phenomena is the curvilinear motion of bodies in free space; it is observed through the whole extent of the solar system.

The mechanical history of nature begins therefore with astronomy. Here, from the general phenomena of the planetary motions, is evinced the fact of the mutual deflection of every body towards every other body, and this in the inverse proportion of the squares of the distance, and the direct proportion of the quantity of matter. This is the fact of universal gravitation, indicating the agency, and measuring the intensity, of the universal force of mutual gravity.

Having established this as an universal fact, the natural philosopher proceeds to point out all the particular facts which are comprehended under it, and whose peculiarities characterise the different movements of the solar system. That is, in the language of philosophy, he gives a theory or explanation of the subordinate phenomena; the elliptical motions of the planets and comets, their mutual disturbances; the lunar irregularities; the oblate figure of the planets; the nutation of the earth's axis; the precession of the equinoxes; and the phenomena of the tides and trade-winds; and he concludes with the theory of the parabolic motion of bodies projected on the surface of this globe, and the motion of pendulums. As he goes along, he takes notice of the applications which may be made to the arts of life of the various doctrines which are successively established; such as chronology, astronomical calculation, dialling, navigation, gunnery, and the measuring of time.

If a square parcel of sand be lying on the table,

and the finger be applied to any part of it to push it along the table, that part is removed where you will, but the rest remains in its place but if it is a piece of sand-stone of the same materials and shape, and the finger is applied as before, the whole is moved; the other parts accompany the part impelled by the finger in all its motions.

From the moon's accompanying the earth in all its motions round the sun, we infer a moving force which connects the moon and earth. In like manner, we must conclude that a moving force connects the particles of the stone; for we give the name force to every thing which produces motion; we call it the force of cohesion; a term which, like gravitation, expresses merely a fact.

This seems to be the next phenomenon of the universe in point of extent.

Having, from the general phenomenon, established the existence of this force, the philosopher proceeds to ascertain the laws by which its exertions are regulated, which is the ascertaining its distinctive nature and properties. This he does in the same way that he ascertained the nature of planetary gravitation, viz by observing more particularly the various phenomena.

Here is opened a most extensive and varied field of observation, in which it must be acknowledged that very little regular and marked progress has been made. The variety in the phenomena, and the consequent variety in the nature of the connecting forces, appear as yet inconceivably great; and there seems little probability of our being able to detect in them all any sameness, combined with the other distinguishing circumstances, as we have done in the case of gravity. Yet we should not despair. Boscovich has shown, in the most unexceptionable manner, that although we shall suppose that every atom of matter is endued with a perfectly similar force, acting in a certain determined ratio of the small and imperceptible distances at which the particles of matter are arranged with respect to each other, the external or sensible appearances may, and must, have all that variety which we observe. He also shows very distinctly, how, from the operation of this force, must arise some of the most general and important phenomena which characterise the different forms of tangible bodies.

We observe the chief varieties of the action of this corpuscular force on the bodies which we denominate hard, soft, solid, fluid, vaporous, brittle, ductile, elastic. We see instances where the parts of bodies avoid each other, and require external force to keep them together, or at certain small distances from each other. This is familiar in air, vapours, and all compressible and elastic bodies.

This is evidently a most curious and interesting subject of investigation. On the nature and action of these corpuscular forces depend the strength or firmness of solids, their elasticity, their power of communicating motion, the pressure, and motion, and impulse of fluids; nay, on the same actions depend all the chemical and physiological phenomena of expansion, fusion, congelation, vaporisation, condensation, solution, precipitation, absorption, secretion, fermentation, and animal and vegetable concoction and assimilation.

Out of this immense store of phenomena, this inexhaustible fund of employment for our

PHYSICS.

powers of investigation, the natural philosopher selects those which lead directly to the production or modification of sensible motion.

He will therefore consider,

1. The communication of motion among detached and free bodies, establishing the laws of impulse or collision. This has always been considered as the elementary doctrine of mechanical philosophy, and as the most familiar fact observed in the material world; and in all ages philosophers have been anxious to reduce all actions of bodies on each other to impulse, and have never thought a phenomenon completely explained or accounted for till it has been shown to be a case of impulse. This it is which has given rise to the hypotheses of vortices, ethers, magnetic and electric fluids, animal spirits, and a multitude of fancied inter-mediums between the sensible masters of matter, which are said in common language to act on each other. A heavy body is supposed to fall, because it is impelled by a stream of an invisible fluid moving according to certain conditions suited to the case. The filings of iron are supposed to be arranged round a magnet, by means of a stream of magnetic fluid issuing from one pole, circulating perpetually round the magnet, and entering at the other pole, in the same manner as we observe the flote-grass arranged by the current of a brook.

But the philosopher who has begun the mechanical study of nature by the abstract doctrines of dynamics and made its first application to the celestial phenomena, and who has attended carefully to the many analogies between the phenomena of gravitation and cohesion, will be at least ready to entertain very different notions of this matter. He will be so far from thinking that the production of motion by impulse is the most familiar fact in nature, that he will acknowledge it to be comparatively very rare; nay, there are some appearances in the facts which are usually considered as instances of impulsion, which will lead him to doubt, and almost to deny, that there has ever been observed an instance of one body putting another in motion by coming into absolute contact with it, and striking it; and he will be disposed to think that the production of motion in this case is precisely similar to what we observe when we gently push one floating magnet towards another, with their similar poles fronting each other. There will be the same production of motion in the one and diminution of it in the other, and the same uniform motion of the common centre of gravity: and, in this case of the magnets, he sees completely the necessity of a law of motion, which is not an axiom, but is observed through the whole of nature, and which receives no explanation from any hypothesis of an intervening fluid, but is even totally inconsistent with them. We mean, "that every action of one body on another is accompanied by an equal and opposite action of that other on the first." This is usually called the equality of action and reaction: it is not intuitive, but it is universal; and it is a necessary consequence of the perfect similarity of the corpuscular forces of the same kinds of matter. This general fact, unaccountable on the hypothesis of impelling fluids, is considered in the planetary motions as the unequivocal indication of the sameness of that gravity which regulates them all. The rules of good reasoning should make us draw the same conclusion here, that the particles of tangible matter are connected by equal and mutual forces, which

are the immediate causes of all their sensible actions, and that these forces, like gravitation, vary with every change of distance and situation.

The laws of collision and impulsion being now established, either as original facts or as consequences of the agency of equal and mutual force which connect the particles of matter, the philosopher considers,

2. The production of motion by the intervention of solid bodies, where, by reason of the cohesion of matter, some of the motions are necessarily confined to certain determinate paths or directions. This is the case in all motions round fixed points or axes, or along planes or curves which are oblique to the action of the forces.

This part of the study contains the theory of machines, pointing out the principles on which their energy depends, and consequently furnishing maxims for their construction and improvement. But these observations do not complete the discussion of the mechanism of solid bodies: they are not only solid and inert, but they are also heavy; therefore the action of gravity must be combined with the consequences of solidity. This will lead to discussions about the centre of gravity, the theory and construction of arches and roofs, the principles of stability and equilibrium, the attitudes of animals, and many particulars of this kind.

3. The philosopher will now turn his attention to another form, in which tangible matter exhibits many interesting phenomena, viz. fluidity. The first thing to be attended to here is, What is that particular form of existence? What is the precise phenomenon which characterises fluidity? What is the definition of a fluid? This is by no means an easy question, and considerable objections may be stated against any definition that has been given of it. Sir Isaac Newton says, that a fluid is a body whose particles yield to the smallest impression, and by so yielding are easily moved among themselves. It may be doubted whether this be sufficiently precise; what is meant by the smallest impression? and what is easily moving? Is there any precise degree of impression to which they do not yield; and do they oppose any resistance to motion? And a stronger objection may be made. It is not clear that a body so constituted will exhibit all the appearances which a body acknowledged to be fluid does really exhibit. Euler offers some very plausible reasons for doubting whether it will account for the horizontal surface, and the complete propagation of pressure through the fluid in every direction; and therefore prefers selecting this last phenomenon, the propagation of pressure *quodcumque versum*, as the characteristic of fluidity, because a body having this constitution (on whatever circumstances it may depend) will have every other observed property of a fluid. But this definition is hardly simple or perspicuous enough; and we think that the objections against Newton's more simple and intelligible definition are not unanswerable. Boscovich defines a fluid to be, a body whose particles exert the same mutual forces in all directions; and shows, that such particles must be indifferent, as to any position with respect to each other. If no external force act on them, they will remain in every position, and will have no tendency to arrange themselves in one position rather than another; differing in this respect from the particles of solid,

PHYSICS.

or soft, or viscid bodies; which require some force to change their respective positions, and which recover these positions again when but gently disturbed. He illustrates this distinction very beautifully, by comparing a parcel of balls thrown on quicksilver, and attracting each other with a parcel of magnets in the same situation. The balls will stick together, but in any position; whereas the magnets will always affect a particular arrangement.

When the characteristic phenomenon of fluidity has been selected, the philosopher proceeds to combine this property with gravity, and establishes the doctrines of hydrostatics, or of the pressure and equilibrium of heavy fluids, the propagation of this pressure in every direction; and demonstrates the horizontality of surface assumed by all perfect fluids.

These doctrines and principles enable us to determine several very interesting circumstances respecting the mutual pressure of solids and fluids on each other; the pressures exerted on the bottoms and sides of vessels; the support and whole mechanism of floating bodies, &c.

He then considers how fluids will move when their equilibrium of pressure is destroyed; and establishes the doctrines of hydraulics, containing all the modifications of this motion, arising from the form of the vessels, or from the intensity or direction of the pressure which occasions it. And this subject is completed by the consideration of the resistance which fluids oppose to the motion of solid bodies through them, and their impulse on bodies opposed to their action.

These are very important matters, being the foundations of many mechanical arts, and furnishing us with some of our most convenient and efficacious powers for impelling machines. They are also of very difficult discussion, and are by no means completely investigated or established. Much remains yet to be done both for perfecting the theories and for improving the arts which depend on them.

It is evident, that on these doctrines depend the knowledge of the motions of rivers and of waves; the buoyancy, equilibrium and stability of ships; the motion of ships through the waters; the action of the winds on the sails; and the whole arts of marine construction and seaman-ship.

There is another general form of tangible matter which exhibits very different phenomena, which are also extremely interesting; we mean that of vapour. A vapour is a fluid; and all the vapours that we know are heavy fluids: they are therefore subject to all the laws of pressure and impulse, which have been considered under the articles **HYDROSTATICS** and **HYDRAULICS**. But they are susceptible of great compression by the action of external forces, and expand again when these forces are removed. In consequence of this compression and expansion, the general phenomena of fluidity receive great and important modifications; and this class of fluids requires a particular consideration. As air is a familiar instance, this branch of mechanical philosophy has been called **PNEUMATICS**.

Under this head we consider the pressure of the atmosphere, and its effects, both on solid and fluid bodies. It produces the rise of waters or other fluids in pumps and syphons, and gives us the theory of their construction: it explains many curious phenomena of nature, such as the motions in the atmosphere, and their connection

with the pressure of the air, and its effect on the barometer or weather-glass. Air, when in motion, is called wind; and it may be employed to impel bodies. The theory of its action, and of its resistance to moving bodies, is therefore to be considered in this place.

But besides their motions of progression, &c. such as we observe in winds, compressible or elastic fluids are susceptible of what may be termed internal motion; a kind of undulation, where the contiguous parts are thrown into tremulous vibrations, in which they are alternately condensed and rarefied: and these undulations are propagated along the mass of elastic fluid, much in the same way in which we observe waves to spread on the surface of water. What makes this an interesting subject of consideration is, that these undulations are the more ordinary causes of sound. A trembling chord, or spring, or bell, agitates the air adjoining to it: these agitations are propagated along the air, and by its intervention agitate the organ of hearing. The mechanism of these undulations has been much studied, and furnishes a very beautiful theory of musical harmony.

The philosopher examines the law of compressibility of air and other elastic fluids: and thus gets the knowledge of the constitution of the atmosphere, and of the action of those fluids when employed to impel solid bodies. Gunpowder contains an immense quantity of permanently elastic air, which may be set at liberty by inflammation. When this is done at the bottom of a piece of ordnance, it will impel a ball along the barrel and discharge it from the muzzle in the same way that an arrow is impelled by a bow. And thus having discovered in what degree this air presses in proportion to its expansion, we discover its action on the ball through the whole length of the piece, and the velocity which it will finally communicate to it. Here then is contained a theory of artillery and of mines.

Chemistry teaches us, that most bodies can be converted by fire into elastic fluids, which can be employed to act on other bodies in the way of pressure or impulse. Thus they come under the review of the mechanical philosopher; and they have become interesting by being employed as moving forces in some very powerful machines.

These discussions will nearly exhaust all the general mechanical phenomena. There remain some which are much more limited, but furnish very curious and important subjects of investigation.
